THE
FOREIGN QUARTERLY REVIEW,

No. XLVIII.

FOR JANUARY, 1840.

ART. I. — *Ariadne*. — Die TRAGISCHE KUNST der Griechen in ihrer Entwicklung, und in ihrem Zusammenhange mit der VOLKSPÖESIE. Von O. F. Gruppe. (The Tragic Art of the Greeks. By O. F. Gruppe.) Berlin. 1834.

WHEN Schlegel (in 1816) gave to the world his celebrated dramatic lectures, it was natural in the then state of our criticism to suppose that he wished to make a sensation in the literary commonwealth by overtrumpeting the Greek drama altogether, and especially by outrageously bepraising Æschylus, Sophocles, and Aristophanes, at the expense of Euripides. What effect, we may now reasonably ask, has experience of more than twenty years had in confirming, weakening, or in any wise modifying the critical decisions of the German Aristarchus? Where does our English criticism of the Greek theatre stand at the present moment? Have we been moving at all? And if we have been moving, have we advanced in the line of Schlegel, and beyond Schlegel?—or have we been forced to retrace the rash steps we ventured in his track, after discovering him to be a quack and a deceiver, a big declaimer of sublime nothings, after the true German fashion, as we charitably imagine that fashion to be? Have we, with genuine British productiveness, pioneered a new path for ourselves, and entered heart and hand into living fellowship with ancient Greek poetry, by immediate and direct wedlock? Or do we

still curiously amuse our academic leisure with measuring mechanical cæsuras and fingering Cretic endings; and paring the nails, and “unrolling the mummy-bandages” of antiquity, and in various other edifying ways calling the ancients Lord, Lord, and doing not the things which they say?

The answer to these questions is short. Mitchell and Sandford and other native scholars have published to the British public that the German was quite right in the matter of Aristophanes. The pious labours of Blomfield, Schölefield, and others seem to be a clear admission that he was also right in the matter of Æschylus. As to Sophocles, no person ever ventured to doubt the justice of his praise; though perhaps here and there a cold English *litterateur* might have venom enough in his dry, dusty heart to criticize down the fine enthusiasm of the German into “rhodomontade.” With Euripides the case is, we believe, yet *sub judice*; but we are inclined to think that, among those who interest themselves in these matters, there prevails a pretty general feeling in favour of the scourged tragedian and an inclination, by the application of leniments and soothing drugs, to smooth away the point of Schlegel’s ridicule. But is this anything more than a feeling? a very amiable and pretty feeling indeed, but withal a prejudice, arising more from superstitious reverence for antiquity than religious love of truth. Has any person succeeded in disproving the charges which the acute German brought against

the blundering Greek? or do all these charges stand unrefuted in the last edition of the Greek theatre, and the last classical article of the Quarterly Review? Let us inquire calmly.

We assert that the accusations of Schlegel will stand the test of the most severe and scrutinizing criticism, and moreover that he brought no charge against the tragedian which does not lie clearly implied, if not explicitly said, in the works of the most acute and discerning of the ancients. The German knew well what ground he was standing on; and he cites expressly the authority of Aristotle and Quintilian to support his views. Add to this the authority of Aristophanes, now (thanks to Welcher and Mitchell) no longer sneered at by prim martinets of criticism, as a low buffoon and a common jester, but held up to public admiration as at once the journalist, the critic, the censor, the dramatist of the most polished, and the prime wit of the most witty age of Greece—something above Rabelais, but not quite so high as Shakspeare. Him, however, we pass.

But what says Aristotle? He compliments Euripides certainly as the most tragic of the tragedians, but in a manner and in a connection which altogether precludes the supposition that he meant by this phrase to crown the name of Euripides with serious dramatic eulogy. The philosopher (Poet. c. 13) is discoursing about the effect of dismal, and, what we call, tragic catastrophes in the drama; and, in accordance with his own theory of moving pity and terror, he (somewhat narrowly, doubtless) awards the superiority to those dramas which end in the blackest mischance—*εις δυστυχίαν τελευτῶσι*. Medea, according to this theory, is a better drama than the Eumenides, and Hecuba than Philoctetes; and Euripides, he adds, is in this respect much to be praised, because *ει και τα αλλα μη εν οικονομει, αλλα τραγικωτατος γε των ποιητων φαινεται*. What value is to be placed upon Aristotle's opinion in a matter of this kind we shall presently inquire; but the praise, taken at its highest value, is very scant indeed. Euripides, in so far as his catastrophes are concerned, is very savage and bloody, and therefore "*though in other respects he manages badly*," yet in this he may be considered "*the most tragic of the poets*." Alas! for poor John Ford, if we had nothing more to say for his great play than that he murders half-a-dozen respectable persons in the course of it, and in the last scene we find the stage direction—

"Enter Giovanni with a bloody heart on his dagger!"

And yet this much, and no more, is the compliment which the Stagyrte pays to Euripides when he calls him the most tragic of the poets.

We ourselves are willing to concede much more. We say that Euripides is not only the most tragic of the poets in respect of bloody catastrophes (though the contrary is true of many of his plays), but also the most pathetic in respect of moving eloquence, and the most pleasing in respect of sweet, flowing and elegant declamation. But with all these accomplishments we do not make him a dramatist, or the shadow of a dramatist. What then?—a lyrist? Unquestionably. A rhetorician; this chiefly, and beyond all doubt, as Cicero well knew, himself the great pattern, and Quintilian, the great master, of Roman eloquence. Quintilian also, like the Stagyrte, seems to eulogize Euripides. But alas! only *seems*. His praise is pure damnation, not because it is faint, but because it is too strong the wrong way; for a man may as well commend a song by saying that it is very epigrammatic, as commend a tragedy by saying that it is very rhetorical, and (what is worse) very forensic. These are Quintilian's words: and for the sake of sound sense and impartial criticism we shall quote them at length:—"Illud quidem nemo non fateatur necesse esse, iis, qui se ad agendum comparant utiliorem longe Euripidem fore. Nam is et in sermone magis accedit oratorio generi; et sententiis densus: et in iis quæ a sapientibus tradita sunt, pene ipsis par, et in dicendo et respondendo, cuilibet eorum qui fuerunt in foro disertis, comparandus. In affectibus vero cum omnibus mirus, tum in iis qui miseratione constant facile præcipuus." In plain English, if a man wishes to speak smooth words by the hour, to stave off the decision of a hopeless case, to whitewash the rottenness of knavish particulars by the speciousness of virtuous generals, to move a silly jury to tears over the self-created miseries of a fool;—in such cases let him study Euripides. This is the advice of Quintilian; and had the poet of the Medea written in English, and not in Greek, we should have most heartily joined in enforcing the advice on our young barristers. As it is, we must confess ourselves exceedingly sceptical as to the amount of real benefit to be derived by English speakers from the study either of Greek orators or Greek oratorical play-writers. Life is too short, and art too long, for every man's professional Iliad to begin with the egg of Leda.

But as to the Greeks and the Romans (who all spoke Greek) Quintilian was undoubtedly right; and indeed he says no

more than what Aristophanes had said before him (though in a different style) when he laughed the sensitive poet away to Macedonia (see Thomas Magister's Life) by calling him ποιητῆς ρημάτων δεικνυμένων (the poet of forensic phrases) and other surnames too true to be relished. Euripides was a very king of rhetoricians; so all his biographers inform us; πολλοὺς προσεξέχευε λόγους καὶ ρητορίας, says Elmsley's anonymous biographer; and though but the son of a vintner and a seller of kitchen herbs (Aristophanes knew better than Moschopulus), yet he could afford to take lessons from Prodicus, the famous itinerant sophist, who charged fifty drachmæ every time he opened his mouth, and was at last put to death by the Athenians (as Xenophon relates) for corrupting the youth of the city. There is indeed great reason to suppose that Euripides altogether mistook his calling in applying himself to the drama; and to judge from the notice of his biographers (there are three besides Suidas) compared with the very marked character of his works, we feel ourselves warranted in saying that he was intended by nature, perhaps for a painter, perhaps for a barrister, most probably for a union of sophist and philosopher—certainly not for a dramatist. Moschopulus and Suidas tell us that he applied himself to drama only after he had seen, by the sad example of Anaxagoras, that it was an unsafe thing for a Greek to philosophize: what therefore he could not say in his own person without danger of the hemlock, he could say by the mouth of others in fictitious dialogue. This was not a very straightforward proceeding certainly; and the more blameable for this reason that the Athenian tragedians were all sacred poets, and attached by virtue of their office to the religion of the state. That this story is true we have pretty strong evidence in the eighteen surviving tragedies; all his characters, men, women, and children, heralds, nurses, and drunken deities, are ever philosophizing, in season and out of season; what we call dialogue is with him oration: and the insinuation and peroration of every speech is a philosophic gnome: nothing with him is done or said without cause shown, as the lawyers say; every character is a herald of himself; no one is virtuous without discoursing on his virtue; no one is natural (when it chances to be) without a formal treatise on the "*vivere convenienter naturæ*;" every hero and heroine is lavish of life, generally without a dramatic motive, never without a rhetorical reason: a mother will not even weep for her dead child without telling you how proper a thing it is for mothers to be pitiful;

turn where you will, at all times and in all cases, you find rhetoric, morality, philosophy, by intention—drama sometimes, and, in some cases, by chance.

It is a most curious thing to observe, with regard to Euripides, that his biographers have, with the most amiable simplicity, narrated, as his greatest virtues, what are, in fact, his greatest and most obvious faults. No Boswell, for instance, ever matched the following, from Thomas Magister.

"He shone in tragedy, and was the author of many inventions in the art dramatic, which none of his predecessors had an idea of; for the adumbration of the argument in the commencement of the play, leading the hearer by the hand, as it were, into the secret of the story, is peculiar to Euripides; the clearness and breadth of his dialogue is also remarkable; and his style is distinguished no less by justness of argument than by graceful rhythm; he is abundant in philosophic gnomes, and they are always well suited to the subject."*

Of all this eulogy only one article contains any real praise—that of the gracefulness of the Euripidean rhythm. His choruses float luxuriantly, like a rich bed of white ranunculus and water-lilies; a strange contrast to the strong, rough outline of Æschylus; an angular writing, which, with much labour, those learned in the priestly wisdom of Egypt alone can spell; but this is the praise of a lyric poet, and we are at present writing of the drama.

Now, as to the first matter of the prologue, it is happily quite true, as Magister says, that this is an invention (*τεχνημα*) of Euripides; so characteristic, indeed, is it of this writer, that the only two dramas which want it, the Rhesus and the Iphigenia in Aulis, have, for this among other reasons, been shrewdly suspected to be the product of some other pen. With regard to the Rhesus, the matter seems pretty certain, for the ancients have transmitted their doubts as to its authenticity; and external combines here with internal evidence to warrant the scepticism of a modern critic. The doubts as to the Iphigenia originate, we believe, with Herr Gruppe, concerning whose valuable work we shall have occasion to say more immediately.

But what sort of a thing, in truth, is this Euripidean prologue? Schlegel has com-

* Ἐλαμψεν ἐπὶ τῇ τραγωδίᾳ σεμνῶς—πολλὰ γὰρ εἰς τὴν τέχνην ἐξέχευεν ἃ οὐδεὶς τῶν προ αὐτοῦ τοῦ γὰρ ἐν ἀρχῇ τοῦ δράματος τὴν ὑπόθεσιν διατυπῶν, καὶ τὸν ἀκροατὴν ὥσπερ χαίρων εἰς τὸ ἐμπροσθεν, Εὐριπίδου τέχνημα· τοῦ τε σαφηνεῖν καὶ πλατὺς εἶναι τὰ λεγόμενα καὶ τὴν ἐρμηνείαν ποικίλλειν ἐπιχειρήσει τε καὶ ῥυθμῷ χαριεντι· καὶ γνῶμας εἰσαγεῖν συνεχεῖς καὶ καλὰ τῷ ὑποκειμένῳ προσφορὰς.

pared it to the speaking labels which come out of the mouths of the figures in old paintings; and the comparison is not merely humorous, as some have observed, but literally and strikingly true. The Euripidean prologue is a formal and detailed piece of self-heralding by some principal character in the play, which in the infancy of the dramatic art—in Phrynichus and Æschylus—might have been tolerated; but in Euripides is altogether without palliation. It is the clumsy blunder of a rhetorician, who takes delight in tricking out, in an elaborate statement of the cases, what ought to be elicited by natural dialogue, or quietly educed by befitting soliloquy. A more undramatic, antidramatic invention Euripides could not have stumbled on. Take, for instance, the prologue to the *Iphigenia in Tauris*, which begins like the pedigree of a race-horse, as far back as the memory of famous ancestry reaches.

Πέλοψ ὁ Ταντάλειος ἐς Πῖσαν μολὼν
θαῦσιν ἵπποις Οἰνομάου γαμεῖ κόρην,
ἐξ ἧς Ἀτρεὺς ἔβλασθεν· Ἀτρεὺς δὲ παῖς
Μενέλαος Ἀγαμέμνων τε· τοῦ δ' ἔφυν ἐγὼ
τῆς Τυνδαρείας θυγατρὸς Ἰφιγένεια παῖς,
ἦ ἀμφὶ δῖναις ἀς θάμ' Ἑρίπος πικναῖς
αὔραις ἐλίσσων κνανέαν ἄλα στρέφει,
ἔσφαζεν Ἑλένης οἶνεχ', ὥς δοκεῖ, πατὴρ
Ἀρτέμιδι κλειναῖς ἐν πυχαῖσιν Αὐλίδος.*

Let the student of poetry compare this formal exposition of lineage with the natural and beautiful soliloquy spoken by the same *Iphigenia*, in Göthe's classical play,† and he will understand at once what a rare invention the Euripidean prologue is, and what the famous praise of Thomas Magister is worth.

But this is not all. The Euripidean prologue not only states what is, and what has been exhibited of the story preparatory to and beyond the action, but it anticipates the action itself, and blabs the final catastrophe in the opening speech. So in the *Ion*; so in the *Hecuba*; so also in the *Alcestis*, (v. 65,) though the prologue of this play is cast in the shape of a dialogue. The story of *Hecuba* is well known. Euripides' play represents the sorrows of the captive queen; and is more properly a dramatic wail than

what we call a drama. To exhibit a wail dramatically it seems pretty obvious that tidings of unexpected woe should break in upon the sufferer, stroke after stroke increasing in severity. Thus, like the *Prometheus Bound*, the *Hecuba* might have acquired the simple grandeur of a picture whose accessory figures are varied, and light after light is thrown in upon the principal group, every new light bringing out its significance in more skilful relief. But Euripides, the fine rhetorician, and bearded philosopher, (ελεγετο δε βαθύν πωγωνά θρεῖσαι — *Vit. Anon.*) was not a man to take a lesson from the stout, old soldier-bard of the *Prometheus*; he doubtless conceited himself far in advance of a poet whom even Aristotle thought too old-fashioned to be praised; he has sneered at the father of tragedy in more places than one, where the allusion is as obvious as it is ungenerous.* It is the duty of posterity to return the sneer; and it may be most fitly cast upon the prologue of the *Hecuba*. Here the son of the Phrygian queen formally announces himself to the spectators in the shape of a ghost; he has been murdered by a Thracian barbarian, and is waiting for burial; his sister *Polyxene* is to be slaughtered to satisfy the manes of *Achilles*: these two things are formally expounded in a long prologue of sixty lines; and this for no other purpose that can be imagined, than that they may be expounded a second time in the simple course of a short play, and the sympathetic spectator be scientifically prepared not to feel too deeply the woes of the bereaved mother. This blunder is so monstrous, that a modern reader will hardly believe it. Surely *Aristophanes* was entitled to indulge his lungs in a hearty laugh at such dramatic incapability.

What if Æschylus had announced *Io* and *Hermes* in a formal oration before the admirable opening dialogue of the *Prometheus*? Choked and smothered his plot in its very first breath of life? And yet there have been critics, and sensible critics too, who have not found language strong enough to express "the transcendent and bewitching beauty" of the Euripidean prologues, and who have recorded their surprise that *Sophocles* had for the most part omitted "this elegant introduction."† We believe that neither *Sophocles* nor Æschylus ever heralded their plays into notice with such cold formal chancery statements as the prologues in question. There is not even one play out

* "Pelops, the son of Tantalus, coming to Pisa with swift horses, married the daughter of Oenomaus, of whom Atreus was born; the sons of Atreus were Menelaus and Agamemnon, of which Agamemnon and the daughter of Tyndareus, I, Iphigenia, am the daughter; whom, near the currents which Euripus, with frequent breezes curling the dark sea, urges, my father sacrificed, as is believed, to Artemis, for the sake of Helen, in the famous bay of Aulis."

† "Heraus in Eure Schutten rege Wipfel
Des alten heiligen dicht-belaubten Haines!" &c.

* The passages are well known—one in the *Electra* and the other in the *Phœnissæ*.

† We are quoting now from an otherwise admirable article in the *Edinburgh Review*, vol. xlix.

of the seven which remain to us by the father of tragedy, where the prologue stands out from the piece like the long sign of a cheap shop, as is the literal character of most of those of Euripides.

The most formal prologue in Æschylus is that of the Eumenides, where the Pythoness of Delphi explains her office and its descent somewhat over curiously; but the prologue does not proceed long with this formality; the genius of Æschylus speedily breaks out; and we are plunged at once into the middle of a scene, which, for breadth of dramatic outline, and intensity of dramatic effect, has been rivalled only by Shakspeare. But Æschylus, for the most part, begins his plays with the chorus; (a *παροδος* in anapaestic verse, or march-time;) or where he prefixes a speech, as that of the watchman in the Agamemnon, it is natural and appropriate, and an essential part of the action; or he sets out, as in the Seven, with a dialogue, also natural and appropriate, and the proper starting-point of what follows. With such an example before him (to say nothing of the finished wit of Sophocles) when Euripides purposely introduced his famous invention of the prologue, what can we say, but that he showed himself an eloquent rhetorician and declaimer, but un instructed in the very commonest laws of dramatic composition?

With regard to the other items of Magister's eulogy, we have only to say, that the *σαφηνεια* and *πλατυς* which he so much lauds, do on not a few occasions transform themselves into that thin transparency and loose breadth of style which is another of those obvious characteristics that stamp Euripides as an orator, not a dramatist. Besides, what critic will say that breadth and clearness are the distinguishing characteristics of a good dramatic style? If this is not nervous, vigorous, and manly, it is no dramatic style. Without a certain pregnant Laconism it cannot be so; and therefore it is that we English are so much better dramatists than the ancient Greeks or the modern Germans. The best of the former were too curious about mere words; there were more fluent orators than wise generals in the late liberation war; and as to the Germans, and their most undramatic literature—we speak *at* things, and they discourse *about* things.

We said above, that Euripides was perhaps intended by nature for a painter. We shall add a word of explanation on this matter. Painters are seldom talkers; he who has trained his eye to learn the wisdom of God is, for the most part, slow of tongue to babble the vain conceit of man; and Sir Joshua Reynolds justly considers it as a great evil when a son of the brush is tempted

to win popularity by the easy praise of fluent discourse. Nevertheless we have some problematic minds, such as Fuseli, of whom it is difficult to say whether nature meant them to express their quick fancies simultaneously or successively. Göthe also had a long battle with himself as to his proper destination in this respect; and it is certain that his later works smack more of the artist than the man: calm Arabesque painting, not vigorous poetic movement. Something of a like nature seems discoverable in Euripides. His biographers inform us, not merely that he was an amateur in the fine arts, but that, in the outset of his career, he actually was a painter; and in proof of this they tell us, that pictures by him were publicly exhibited at Megara. In remarkable accordance with this statement is the style of his works, in which the most superficial reader must have noticed that the descriptive and pictorial parts are generally the best. The *πρωτον μιν, επετα δε* of his formal, rhetorical declamations, misnamed dialogue, almost always wearies; but the vividness and richness of his painting, whether it be of a Bacchantic revel among the woods of Cithæron, a sacrifice in the harbour of Aulis, or a chariot race on the plains of Elis, never fails to charm. And who, with an eye for art, can read the Hecuba, and pass over the beautiful picture in the well-known lines spoken by Polyxene to Ulysses?

ὁρῶ σ', Ὀδυσσεῦ, δεξιὴν ὑφ' εἵματος
κούπτοντα χεῖρα, καὶ πρόσωπον ἔμπαλιν
στρέφοντα, μὴ σου προσθίγω γενειάδος.*

As in other places nature is substituted by rhetoric, so here action is supplanted by the officious painting of action. We are not unaware that Æschylus paints also, and the Greek drama generally more than it ought; but our remark is, that Euripides is as peculiarly strong in pictorial description as he is weak in dramatic effect, and clumsy in dramatic machinery. The student will examine for himself; but if our remark be right, then, in one respect at least, Mr. Taylor, of Norwich, (that "Arch-Philistine"†) was not so far wrong when he compared Göthe to Euripides; and Lord Byron, when he said that he did not relish painting, spoke perhaps the instinctive voice of nature, since he was born to be a poet.

The dramatic incapacity of Euripides,

* "I see thee, Ulysses, hiding thy right hand in thy mantle, and turning thy face from me, lest I should touch thy chin" (the ancient form of supplication).

† "A Philistine is a man who walks anxiously upon eggs."—*Burschen Song*.

over and above the matters already touched on, appears principally in these three things.

First. The different parts of his plot do not grow organically *with, in, and out of* one another; but one part is pieced to another, or patched on it.

Secondly. Even with the most simple materials he fails to produce a unity of impression; the good is universally neutralized by something bad; and confusion and dissatisfaction are the result.

Thirdly. His characters want nature, truth and consistency; and it is but too manifest that not they are speaking, but the rhetorician and philosopher through them.

It were a tiresome and thankless task to pursue the illustration of these Euripidean characteristics through the whole eighteen plays. A great deal has been already done by Schlegel; and he who wishes to see the anatomy carried more into detail, and with a more masterly hand, may consult Herr Gruppe. A few remarks, however, on this head, we may be allowed in our own person; only lest we should seem to delight in vague declamation and groundless calumny. To point out faults is always unedifying, especially where they lie as thick as beauties; and the task does not even compensate to the understanding by adding to its acuteness what it takes from the heart by hungering its charity. Nevertheless, if people will worship idols, truth demands that we publicly call them idols, and no gods. The Greeks themselves, should they rise from the dead, would be astonished and ashamed to behold with what foolish admiration sensible British men have paid blind homage to the flimsy productions of their third-rate dramatists. A blunder is not the less a blunder because it is two thousand years old; and is so much the more dangerous because there exists in this free country a certain unwise conservatism in literary matters which upholds ancient wisdom, not because it is wisdom, but because it is ancient; and which stamps a value upon Greek poetry, not because it is poetry, but because it is Greek. Why should Euripides, when he drivels prettily or glitters meretriciously, find more favour than Bulwer when he does the same? Why should a bad play which Porson edited be read and expounded in all the schools, and a good play which Sheridan Knowles wrote be known to our studious yonkers hardly by name? To answer these questions would lead us a long excursion into the philosophy of education, and specially into that domain curiously called classical; but we must proceed in our inquiry.

We have already suggested a comparison

between the Prometheus Bound and the Hecuba. Let us pass from the prologue to the catastrophe of this latter play, and discover another striking characteristic of Euripidean art. The end of tragedy, according to Aristotle's well-known philosophy, is to move pity or terror: the Prometheus, however, produces neither the one nor the other, but only calm admiration; and the Hecuba, clumsily endeavouring to produce both, produces neither the one nor the other, but simple disgust. The woes of Hecuba move pity, and in moving pity lies the strength of Euripides: the first part of the drama, accordingly, (bating always the foolish prologue) containing the wail of Hecuba over her own prostration as a queen, and bereavement as a mother, is good; but the poet straightway proceeds to convert the unfortunate queen into a savage, blood-thirsty barbarian; she murders the two sons of her son's murderer, and puts out the father's eyes, and exults and rejoices in the deed; thus the second part of the drama works deliberately against the first; and the unskilful dramatist freezes the tears which he has himself educed. Far otherwise in the Prometheus. The admiration which the silent obduracy of the patient god had excited in the first scene, not only remains unimpaired, but is strengthened as the action (if it may be called action) proceeds; and continues increasing, not with the hurry-scurry of a modern overture, but with the steady march of moral resolve, to the culminating point of the catastrophe.

In the Greek drama, where the materials worked on were so few, it was above all things necessary that they should be congruous. Æschylus is a master here, and so is Sophocles. What true poet, indeed, ever bundles the parts of a real poem together, or mechanically dovetails them? That is the work of a Pisistratus, or other *διασκευαστής*, collecting and arranging any cycle of old ballads; but a true poem is like a true flower, where each individual petal bears a relation to its brother, and the whole corolla to the cup, and the cup and corolla to the leaves, and leaves, cup and corolla to the whole plant. So it is in the Philoctetes, so in the Antigone, so in the Choephoræ; so also in the Iphigenia in Aulis, the only thoroughly good play among the whole Euripidean collection, which, however, as we had occasion to remark above, is, in this and other respects, so unlike Euripides, that serious doubts have been thrown upon its authenticity.

Look now at the Orestes, the very next play in the common arrangement. This play is intended to dramatize the historical link between the Choephoræ and the Eumenides

of Æschylus. The mother has just been sacrificed to the manes of the father, and the city of Argos is urged by Tyndareus to pass a sentence of death against the murderer of the daughter of Leda. Menelaus, who in the Greek drama always plays the heartless self-interested politician, will not move a step in the cause of his Argive nephew against an Argive mob, and a Spartan father-in-law. The life of the son of Agamemnon is in danger; and the problem of the drama is how that life shall be saved. It is manifest, from the very statement of this case, that the first business of the dramatizer here is to enlist our sympathies in favour of Orestes. He is a mother's murderer certainly, and, in the eye of the public prosecutor of a modern court of justice, guilty of a crime so monstrous, that no eloquence can possibly win for it a tear; but in the ancient Argive legend this crime is a sacred duty, urged by the real voice of filial reverence, and expressly commanded by the infallible voice of a god. It is a duty, however, that brings the performer of it into fearful conflict with the most tender instincts of nature; and in this struggle of commanded duty and commanding instinct the dramatic character of the legend lies. The instinct of the spectator, like that of the doer, rebels against the deed. In spite of this, however, the poet must enlist our sympathies in favour of the murderer; and he can only do so by representing him under the most amiable and engaging aspect: as a virtuous man doomed by divine decrees, or, like Werner, necessitated by circumstances to the commission of a deed against which his inmost nature rebels. The least admixture of savageness or barbarity in his character will cause the mind to leap back into its natural abhorrence of his crime. So in the Choephoræ and the Eumenides there is nothing to destroy the natural sympathy which a pious Greek was naturally disposed to feel for the sorrows of a son commissioned by an oracle to murder his father's murderer. But the Orestes of Euripides, after a beautiful *pictorial* opening, goes on from bad to worse, from selfishness to savageness: every character is more base and more brutal than another. Orestes, Pylades, and Electra, the persons *with* (not *against*) whom we ought to feel and suffer, employ themselves, without shade or discrimination even of villany, in devising and scheming the most public and barbarous butcheries: a melo-dramatic death (amid burning palaces) of the principal parties on both sides is prepared. Helen, the wife, and Hermione, the daughter of Menelaus, are in the act of being publicly slaughtered, that Orestes and

his friends may die amid the due environment of tragic horrors, when suddenly—swift as the studied scene-shifting of our modern effect-pieces—the horrible is changed into the ridiculous. The *Deus ex machinâ* descends; Helen is whipped up into heaven (like Faust in Göthe) by Apollo, that her beauty may no more be the cause of strife to men; and Orestes is married, without further ceremony, to that very Hermione at whose innocent throat he is pointing the barbarous dagger! It is impossible, without reading the piece, to understand the curious feeling which this tasteless jumble of ancient tragedy and modern melo-drama and comedy produces on the mind.

Schlegel is very severe on the *Electra* of our poet, which ends also, in modern fashion, with a marriage: he thinks it the worst play of the eighteen. Among so many bad the choice is hard; but in our opinion the Orestes may well put in a claim for the distinction of being one of the most disgusting and silly plays ever written. We do not quarrel with the conclusion, because it is happy for all parties; the Greek *τραγῳδία* is anything but a *tragedy*, in our sense of the word; but we blame the want of poetic unity and the barrenness of dramatic sympathy which characterize the whole. And yet we are told that this play enjoyed favour on the Athenian stage (*το δράμα των ἐπὶ ἀθηνῶν εὐδοκίμωντων*). This piece of information, however, we can well afford to believe, without throwing any particular imputation on the good taste of an Attic audience; for besides the melo-dramatic trickery of the concluding spectacle, we have the choruses and the music, which, in this play, must have had a peculiar charm. The Phrygian, with his Harmateion melody and barbarous roar (*αρματεῖον μέλος βαρβαρῶν βοῶν*), was, no doubt, something striking and novel in Athens, and might easily have procured for an inferior piece, decked out with the orthodox number of villanies and murders, the praise of a fleeting popularity.

To piece a story historically together is one thing, to organize it poetically is another. Wherever we turn our eyes, to first-rate, or to second-rate dramas, we shall find that Euripides had no notion of poetic organization. In the "*Andromache*" the sorrows of the wife of Hector swallow up all interest during the first half of the play; in the second half the sorrows of Peleus begin, and we hear no more of the original heroine. In the "*Hercules Furens*" there are many fine things, especially in the latter part; but the same want of coherency in the dramatic sympathies is observable. Amphitryon, Megara, and the children occupy our atten-

tion exclusively in the first part ; Hercules exclusively in the second part. One-third of the short play is exhausted before the hero appears, and another third spins itself away before the interest centres in him. The "Heraclidæ," which represents the reception of the sons of Hercules under Athenian protection, is another instance of complete failure from want of a principal figure, round which the interest of the drama may concentrate itself. Iolaus, the heroic old soldier, and Macaria, the heroic girl, are the only characters of any prominence in the piece ; but the rhetorician, after balancing them neatly on his little finger as long, and as long only, as the *historic* progress of the action requires, lets them drop straightway, without ceremony ; and the piece is closed by the introduction of new character, Eurystheus, king of Athens, in whom we can feel no interest, and who neither says nor does anything that in any way tends to bind together the loose fragments of the piece. It is said by some that Euripides is at least superior to Æschylus in the management of his plots. The Heraclidæ compared with the Suppliants will disprove this. Æschylus never undertakes what he cannot manage : his plot is simple, but it is consistent ; it is *one* : his characters are few, but he is never without one or a body of persons (as Prometheus and the Danaïdes) who command prominently the attention of the spectator. Euripides, on the other hand, multiplies the persons in the action only to confound the action itself ; he makes a complex plot, in appearance, by ravelling two or three plots together, instead of unravelling one ; he not only does not manage, but he does not attempt to manage, the speaking puppets of his show. His care is that his characters shall make long speeches, and say fine things. Having done that, they dismiss themselves as they introduced themselves, with a wise text in their own praise. It is not even necessary that they should be consistent with themselves, provided they be consistent with their speeches ; to be consistent with the drama is impossible, when, as in the Andromache, it is made up of two parts that mutually neutralize each other.

It is a common device of Euripides to endeavour to eclipse his predecessors by piling up a huge architecture of events (where bulk at least awes.) and stringing together in one play several distinct actions, of which Æschylus and Sophocles would have made as many distinct plays. This has been ably shown by Gruppe, in reference to the "Phœnissæ," a play whose action properly is the same as Æschylus' Seven against Thebes,

but wherein the poet has clumsily endeavoured to tag both the Antigone and the Œdipus Coloneus to the end. But, as Gruppe well observes, if Antigone leaves Thebes with Œdipus for the Equestrian Hill, what becomes of Polynices and Hæmon ? The Phœnissæ, however, with all its laboured bulk, will ill stand comparison with the simple and consistent grandeur of the Seven. The prologue, spoken by Jocasta, may, as usual, be cut off with much advantage to the play. The chorus, contrary to a well-known rule of Aristotle, does not, as in the Æschylean drama, enter with stirring dramatic interest and striking dramatic effect into the action of the play, but sways loosely and carelessly about it. Then, again, the self-sacrifice of Menœceus is not only, as Gruppe observes, an altogether voluntary and episodical act of heroism, but, by bringing Creon in as a sufferer, acts contrary to the main sympathies of the play. Like Osric in Hamlet, Creon stands by in the Labdacidan story, and cries "A hit ! a hit !" himself unscathed. Hæmon, to be sure, dies in the Antigone, but that is for the sake of Antigone. The death of Menœceus, in the Phœnissæ, is altogether uncalled for ; altogether uninteresting, because altogether unprepared ; altogether undramatic, because the stroke of fate should strike only the fated. Further we may notice how cunningly Æschylus has varied his long narration, by interspersing short choral chants, as well as by the intrinsic peculiarity of his speech. Euripides has given us 220 lines of description, only once interrupted—all the rhetorician, as usual, and nothing of the dramatist. How clumsily, also, is the character of Eteocles managed ! The famous sentiment,—

εἴπερ γὰρ ἀδίκειν χρη, τυραννίδος περὶ
καλλίστον ἀδίκειν* τ' ἄλλα δ' εὐσεβεῖν χρεών,*

of which Julius Cæsar was so fond, is the explanation of the philosopher as to the tyrant's real motives, not the motive which any tyrant would confess to himself, much less trumpet to the world in a formal pleading of his own cause. So plump and unskilful is the rhetorician in the management of human character ! So also Medea tells us, in the same gnomic style, that she is a she-devil, and all women with her—

ἐπιστάσαι δέ' πρὸς δὲ καὶ πεφυκαμένῃ
γυναῖκες· ἐς μὲν εὐθλ' ἀμνηχανώταται,
κακῶν δὲ πάντων τεκτονες σφωτάται.

What unnatural rant is this ! But Euripides

* If injustice be lawful in any case, it is lawful in the pursuit of power ; in other matters a man should be pious.

pides is full of it. His characters make as little conscience of publishing their shame as of oratorizing their own praises : the reason, in both cases, is manifestly the same, as we have already had occasion to observe. It is not the person speaking, but the poet.

The *Medea* is generally considered one of the best plays of Euripides : but we must confess, after several perusals, we have not been able to force ourselves into admiration of it. In the character of *Medea*, as in Euripides' women generally, we see not only that certain amount of bloody propensities which is necessary for tragic purposes, but a gratuitous and unmotivated barbarity. Let any person quietly compare her with Lady Macbeth, and see what he can make of her. Schlegel very properly asks, why does she butcher her children at all?—and if so utterly without need it is consistent in a Colchian sorceress to show herself so magnificently savage, how is it consistent that she should at the same time be so deeply moved by the tender, motherly emotions of her sex, so unable to look upon that πανστατον γέλασμα—that “last smile,” which she herself so unnecessarily had made the last? Does Lady Macbeth in *Shakespeare* relent, except in the sleep-walking scene? We must confess we cannot understand this matter; and as to other things, the play is decked out in all places with the usual number of adventitious patches and false ornaments, which may be taken from Euripides' plays, not only without organic injury, but with material advantage. What, for instance, is the use of the interview with *Ægeus*? This is another episode, in the style of *Menæceus* in the *Phœnissæ*. It does not belong to the organism of this drama to know whether *Medea* goes to Athens or Argos. “Hither to me!” as *Mephistopheles* says to *Faust*, and the rest may be safely, most wisely, left to the imagination of the spectator. Or, if we take Schlegel's apology, that this scene was introduced to gratify the Athenians, this will not mend the matter a whit. *Æschylus* in the *Eumenides*, and *Sophocles* in the *Œdipus Coloneus*, wrote with one view at least, to flatter the Athenians; but their patriotism was interwoven with their plot,—here it is stuck on it.

We hope the reader will now give us credit for having some plausible grounds for the unfavourable opinion we have been obliged to express of Euripides' powers as a dramatist. We shall offer a specimen of Herr Gruppe's critical ability, and then proceed to more pleasant contemplations. He has analyzed at length seven plays of Euripides:—the *Hecuba*, the *Trojans*, the

Bacchæ, the *Hippolytus*, the *Iphigenia in Tauris*, the *Ion*. We shall take his remarks on *Ion*. The subject, as Potter confesses, is a fine one. Serjeant Talfourd has made something of a kindred theme in modern times. What Euripides made of the old story we shall see.

Gruppe gives the narrative of the play down to the chorus of the Athenian virgins, and proceeds,

“ Their curiosity leads them to press further into the temple; but here *Ion* commands them back. Then *Creusa* herself appears; a long *stychomythie** begins: mother and son stand against each other without knowing or suspecting their relationship: and Euripides applies himself diligently to make this situation as piquant as he possibly can.”

Of the scene between *Creusa* and *Ion*, he observes,

“ Then at the conclusion of this long artificial conversation, *Creusa* has to request *Ion* expressly to say nothing of the matter of her friend's exposed child to *Xuthus*, for the men are always disposed without motive to think evil enough of the women.”

After the prayer of the chorus for the race of *Erectheus*,

“ Then follows a scene which is certainly dramatic, and in many respects may be considered as successfully handled—though doubtless in skilful hands much more might have been made of it.”

Of the scene with *Xuthus*—

“ The poet (for he it is that speaks all the while, not *Ion*) falls immediately back on the mother; she must be mentioned prominently now, because she is to be made particularly prominent in the afterpart of the drama. There is no joy, no surrender of the soul to the natural influence of such a situation; the whole scene wants nature, tenderness, and warmth. *Sophocles* would have managed it otherwise.

“ The same want of nature is exhibited in the scene where *Xuthus* explains to his son that he must now follow him to Athens, there to be heir of his riches and his kingdom.”

After blaming the grounds of *Ion*'s apprehensions, Gruppe proceeds,

“ In all this it is manifest the poet speaks,

* A conversation carried on line by line, like a church-catechizing, as Gruppe says in another place—or more exactly like a game at battle-door and shuttlecock when well played. All the tragedians delight in this artificial measured mode of conducting dialogues. When there is pith and point in each line (as *Shakespeare* sometimes manages it,) the effect is pleasant enough. But Euripides, the smooth rhetorician, is not the man for such delicate matters; and his *stychomythies* are generally more weak, tedious, and wire-drawn than even his speeches.

not the persons: he lays out the plans, he keeps a certain aim in his eye, he is continually manœuvring every thing with the most open and unconcealed artifice towards that aim; but actual acting characters are not before us. Why the poet makes Ion speak as he speaks is but too obvious; his scheme is that the thing shall actually turn out so, as Ion is made to fear; he intends to represent Creusa as jealous, he intends that she shall attempt to poison her own son, and finally he intends to make it out, in Ion's very words, that Ion is no stranger, no bastard, no son of Xuthus, but the genuine son of an Athenian, son of Apollo and Creusa. He makes Ion's speech full of unconscious allusions to the actual state of the case; but what is gained by all these allusions? Either we do not yet know what the poet is driving at,—and in this case the allusions will seem as impertinent as they are forced and unnatural: or we do know his drift (as here but too obviously), and then we can scarcely be called upon to forgive the unceremonious nonchalance with which he thrusts his plot into his characters,—asking no questions of nature and consistency,—instead of drawing it out of them. That internal, symmetrical structure, and that richness of *internal* relation of the parts, which we admire in Sophocles, ceases to be art, and to manifest the charm of art, so soon as it does not take place as it were instinctively, while the characters act only from their own free individuality, and the inward necessity of their nature. Here Euripides exhibits the very reverse of all this. Ion is any thing but a young man joyfully surprised to find his father, and in him to find himself the heir of a mighty kingdom: Ion is a mere spiritless hearer of short-sighted, frosty, altogether formal, artistical tricks.*

"But this is not enough: the thing is twice done; not the less formally and circumstantially by outward machinery, because Ion has already rhetorized the whole rant. A tragedy consists in the tying and untying of a knot; it is always best when unexpected joy comes after deep disaster, recognition after misunderstanding; my plan, therefore, thinks Euripides, is to set the people first savagely by the ears together, and then make them shake hands, and smile as comfortably as the converted villains in the last act of a modern comedy. If this were enough to make a work of art, we should feel ourselves obliged to give Euripides this

* To estimate the full value of these remarks the student will compare their precision and truth with the vague, laudatory generalities in Potter's introduction to his translation of this play. Potter was the child of an age whose watchword was *classicality*,—a thing as opposed to nature and freedom, as a drawing-room is to hill and valley. The French were our masters in those days—(as indeed our criticism seems fated to be the slave of foreign impulse); and the French paid as decent a homage to the outer surface of Greek literature, as they were impudent and conceited rebels against its inner spirit.

further praise, that he always brings it about in the shortest and most convenient way. Ion is the son of Creusa, not of Xuthus, but he holds him for his, not she for hers; this, however, is not enough to produce a proper *tragic effect*; and she must be made at least to attempt the life of her own son. But for what reason in *nature*? How comes it to pass that she conceives so violent a hatred for the amiable stranger youth? Does she hate him because he is her husband's son—the husband whom she loves? Does she hate because he was born out of wedlock? On this view of the question her own speeches in the previous part of the play gave us no reason to suspect such wrath; but besides there is the authority of the oracle which she came to consult, and which she also believes. No! no! says Euripides, I am not much concerned that Creusa shall have any natural, sufficient motives for planning this bloody murder, but I shall at least make sure, that no one shall be able to lay his hand on the passage and say, here is an action done without a visible motive. I have nothing to do but bring in a nurse or a pedagogue, who shall advise the deed, and she shall follow the persuasion. The pedagogue is one of those characters brought in adventitiously on all occasions by our poet—his ready helpers out of all difficulties—that seem to enrich the plot by multiplying the persons, but in fact only show the barrenness of the poet in not being able to bring the catastrophe out of the characters that naturally belong to the action. They are a personification of dramatic awkwardness. This pedagogue, in the hands of a true tragedian, would at least have acted from some strong internal motives of his own, and perhaps shown some heroism in the execution of his villany. But Euripides never concerns himself whether his plots are developed by persons who act from natural motives, or by persons in whose motives you feel any interest. The pedagogue accordingly, after performing the part required of him, leaves Creusa in the lurch, and drops out of the piece. How different Dejanira in the *Trachiniæ*! She acts from inward motives, and the strong power of the most natural illusion. Here, however, Ion must remain alive, and Apollo acquire public reverence as the great ancestor of the Ionian race. How this could be brought about by natural and at the same time poetical motives was a question that Euripides, if he ever asked, certainly was not in a condition to answer.

"We now make acquaintance with Creusa as a murderess; and nevertheless the poet attempts to win us with pathetic rhetoric in her favour. She speaks very beautiful words to Apollo, and accuses him of ingratitude to his own child and its mother—the ingratitude of a god towards a mortal. This scene might have had a fine effect, had Euripides power to put it in a proper place; but here it is utterly lost. Her own shameless barbarity has closed our fountain of tears; such a woman was in all likelihood

worthless from the beginning, and Apollo may have treated her only according to her deserts. We cannot force our sympathies."

As to the following scene with the pedagogue,

"The first matter is evidently discussed here a second time, in order to engage our sympathy for Creusa; but the intention, as usual, is too manifest; and the cool, deliberate barbarity of the whole matter, as just mentioned, repels our sympathy. Sophocles interests us in the misfortunes of his heroes: Euripides disgusts us by their crimes. The turn, moreover, which he gives the matter, by making Creusa boast of revenging herself at one blow, both on Apollo and Ion, only makes the matter worse—impiety is here joined to barbarity; and yet it is expected that we shall feel interested in the fate of a creature whom the poet has done every thing in his power to make hateful.

Finally, it is observed,

"We do not in any wise say that the Euripidean play is destitute of successful, aye, poetical passages; but the whole is in no sense to be tolerated as a work of art, and deserves the praise which has here and there been lavished on it, in no manner of way. There is no other drama which exposes so completely the wretched secrets of Euripidean stage machinery, none which exhibits more strikingly the contrast between Euripides and Sophocles. We have here a piece with illusions and misunderstandings enough, rich in those dramatic situations which Sophocles knows so wisely to handle. How otherwise Euripides!—For the pure poetry of the classic tragedian we have here the pointed, barren, thinly-veiled sophistry of a rhetorician; for the great tragic fugue of living characters, we have here not a single living character, much less one in whom the poet has made the spectator feel any thing like a living interest. What Aristotle says of the *Antigone* falsely, suits here admirably; the disgusting, not the tragical, is produced; and over and above this, the piece must end happily too! When Sophocles ends his piece happily, he takes care to make his characters perfectly worthy of the prepared salvation; they bear their sorrows in the first place, and are purified by suffering; the whole piece must have served to developé worth and dignity of character, before a god is introduced to unloose the inexplicable knot of mischance. Euripides, on the other hand, reveals here nothing but wickedness, shame, sin, and suspicion; a blood-thirsty woman, who swears revenge even against the person of the god—and then, *sans ceremonie*, a reconciliation and happy catastrophe, by means of this same god! So faulty is the internal organization of Ion. And even externally the piece wants artistical rounding and completeness. Xuthus (like so many other characters in Euripides'

plays—*Tr.*) loses himself out of the plot, and we hear no more of him. As little is any light thrown on his alleged son, the offspring of a Bacchic woman. This matter should have been explained. Here the poet might have found an *analagon* to Creusa's lapse; reconciliation of man and wife on the footing of mutual forgiveness might have taken place; and then the matter of the poisoning (for which there is no sufficient motive afforded, besides being altogether irreconcilable with the happy event of the piece) might have been altogether dispensed with. In the mouth of Xuthus also should have been placed all those doubts and anxieties as to whether the Athenians would submit themselves to the sway of a foreign prince. There they would have been natural, and might have served to increase the sympathy of the spectator for the principal party. Ion himself, instead of preaching political philosophy, should have surrendered his soul to unsuspecting joy."

In the course of the preceding observations, we have attained to only one result, and that altogether of a negative kind, viz. Euripides is not a dramatist. In this there is small consolation. But we have now to ask ourselves a question, in which, we hope, we have been anticipated by most of our readers, and the solution of which may probably bring forth some positive fruit. If Euripides be indeed the helpless dramatic blunderer that we represent, how comes it to pass that he attained in ancient times such a high rank as poet for the Athenian stage, and how comes it to pass also that in modern times his poetry has been so popular with most of our great men, that even Milton the mighty-minded knew no more familiar bosom-friend in the wide world of books? The second of these questions is more shortly answered than the first. Euripides is a pleasant, fluent, pathetic, philosophic, luxuriant, rhetorical poet enough—and our Greek men, living as they have too often done in the back galleries of literary life (where a man may nod without observation) and nibbling at Greek instead of feeding upon poetry, asked for nothing more. Milton, again, was an architectural poet, and a solemn-building Epopœist, but of a genius essentially undramatic; the beautiful pictures, the magnificent descriptions, and the rich choral festooning of the Greek drama, were exactly suited to his taste. Why he should have preferred the effeminate Euripides to the strong, manly Æschylus, is difficult to explain. Perhaps the notorious difficulty and corruption of Æschylean Greek deterred him from the study; perhaps also (what seems more probable) as

likings, like dreams, are wont to go by contraries, Milton admired Euripides for the same reason that Wilson worships Wordsworth—by the law of opposition—“*un gleich dem gleichem paaret sich gern.*” Besides we must never forget that Milton lived in times when what would now be blamed as a foolish and narrow reverence of classicality, justly claimed the character of a noble and generous enthusiasm. In the infancy of a creed, the fervour of new-kindled devotion animates many superstitions, which in after times congeal into harsh jagged slugs, with which a hard and obstinate bigotry vexes the ribs of men. Iræneus may believe many things with propriety, which Dr. Chalmers may with propriety deride. So Dante and Petrarch may know nothing in the world of highest intellect but Virgil and Plato. So Milton may know no drama superior to the ancient, and out of that pious prejudice, Comus, and Samson, and other the like stiff, formal, modern antiques may come forth; but if Serjeant Talfourd, or Sheridan Knowles, or Bulwer, were to impose such Hellenizing dramas upon the public taste, they would meet with universal ridicule. Of this, however, enough.

Our other question is of more importance. Whence did Euripides win for himself those dramatic laurels with which he unquestionably stood crowned before the Athenian people?—not indeed so proudly as some people imagine—confessedly inferior to Æschylus and Sophocles—for he was only crowned five times* out of some seventy contests; and we know little of Agathon—but still a famous poet, and historically coming down to us as a member of the great tragic triumvirate that gave dramatic laws to Greece in its noblest times. So far as Euripides personally is concerned, the answer is of little or no interest to us; but it obviously implies the answer to a previous question, second to no literary question in importance, viz. What sort of a thing the Greek tragedy was? If Euripides was no dramatist, and nevertheless vied with such men as Æschylus and Sophocles in the dramatic contests of Athens, he must have won his laurels by some other than dramatic virtue. The Greek drama must not be *chiefly and essentially* drama, in our sense of the word. The limbs and flourishes may move for the most part according to dramatic laws, but the soul and plastic germ of the thing is not—cannot be—inherently and necessarily dramatic. What then is the essential, in-dwelling,

formative principle of the Greek tragedy? The subject has been often discussed—the individual abstract notions pertaining to it stated not seldom with sufficient accuracy. But in their cumulative importance they have been rarely apprehended—more rarely still, with a wise and thorough consistency, practically applied.

According to our notion the Greek tragedy consists chiefly and essentially of these three things.

I. A choral hymn to the gods, with dance.

II. A sacred spectacle representing the common and well known fates of heroic and divine persons by a series of living *tableaux*, and illustrated by means of recitation spoken in character.

III. The development of a religious idea.

And we say, that though these three elements may, by the hand of a Sophocles, be so beautifully and skilfully combined as to form a complete work of art, most fitly designated a drama (though very different from what we are accustomed to call such) yet that this beautiful and skilful combination is by no means essential to the idea and organic principle of a Greek tragedy; so much so that a poet like Euripides may be ignorant of the very simplest laws of character and action, and shall be a great Greek tragedian.

It is generally said that the Greek chorus is a part of the drama; according to our view, the drama is a part of the chorus. The chorus is the nucleus; and an imposing well-ordered series of choral songs in reference to one subject, illustrated by a few recitations spoken in character, does in fact constitute a Greek drama—as we see in the *Choephoræ*, the *Suppliants*, and the *Persians* of Æschylus. Professor Jacobs long ago did not hesitate to designate this latter play a *cantata*, not a *drama*; and Professor Herrman, in some late speculations, has divided the Greek tragedies into two kinds—the tragedy proper (such as the *Œdipus Tyrannus* and the *Agamemnon*), and the “*quasi lyricum et cantabile genus tragœdiæ*,”* of which the *Troades* of Euripides furnishes an example. Now in stating what the soul and essence of Greek tragedy is, we take this “*lyricum et cantabile genus*” as the original type and proper emblem of what necessarily belongs to the idea of a Greek tragedy generally. This is intrinsic; the other, or dramatic element, matter of adornment, matter of variation, matter, if you will, of a higher development, but not intrinsic and essential in the germ of the thing. Without a chorus a Greek tragedy cannot be; with-

* Fifteen times, says one of his biographers. But this perhaps includes the cases where he was second best.

* Opusc. vol. ii. p. 312. De Tetralogiâ longâ.

out action, without character—with much pomp of spectacle, with much ravishment of the ear, with little or no nature—it can be. This point of view alone explains the thousand blunders and puerilities of Euripides; alone makes it intelligible how a tender and luxuriant lyrist, a smooth rhetorician, a fluent pleader, has had the happy chance to come down to posterity crowned with the undeserved laurels of a dramatist. Hazlitt said that the Prometheus of Æschylus was more of an ode than a drama. We think he was most unhappy in his example; but there was a glimmering of truth in his idea. The Persians is certainly much more of a solemn national wail than a drama; the Suppliants is a dramatized supplication; the Hecuba and the Troades, each a dramatized wail; the Seven against Thebes is a sacred spectacle, “full of war”—partly and mainly lyric, consisting of fears and prayers before, and laments after the battle; partly epic, consisting of the narrative description of the chief heroes of the invading host. Of action there is very little; of drama in our sense, —impersonated acting characters treading now timidly, now violently rushing through the uncertain paths of complicated events—still less. But take even the Agamemnon, what were the Agamemnon without the chorus, without the musical amœbean chants between Cassandra and the chorus? little more, we fear, than a series of sublime, certainly, but stiff and formal recitations. Is then Æschylus no better than Euripides? do we not contradict ourselves here? Apparently only. In our previous observations, we compared one Greek dramatist with another, and found that, taking the dramatic capabilities of the Greek drama (however small) as they are, Euripides had no notion whatever not only of drama, but not even of poetical unity and harmony in composition. We now set the ancient drama against the modern drama generally; and we maintain, that in none of the Greek dramas, not even the best, was *action* a principal, or even a necessary thing. There may be more progressive movement, more complication of event, in one of these sacred musical spectacles than in another. The Œdipus Tyrannus may suit our ideas of a regular tragedy much better than the Troades, or the Persians; it may also be that Sophocles in the Philoctetes shows a more nice and delicate discrimination of *human* character than Euripides in any of his plays (always excepting the Iphigenia), but neither progressive movement in times, nor curious complexity of event, nor nice discrimination of *human* character, was an essential ingredient of the sacred musical spectacle of

the ancient Greeks—the *τραγῳδία*, or goat-song, which we translate tragedy, and by that single word translate ourselves from Athens into London, from Æschylus to Shakespeare, and into a whole chaotic world of confused and confounding criticism. Music, gods, religious feeling, living tableaux, solemn declamation, belonged essentially to Greek tragedy. Every thing else might be dispensed with.

Of all the elements, however, the chorus, as it was the historical origin, so also it remained, to the last, the centre and nucleus of the whole exhibition. Even in the Euripidean plays the choruses are generally the most splendid and poetical parts to *read*; but the Athenians *heard* and *saw* what we read; and this is a matter to which very wise critics have seldom paid sufficient attention. It is indeed an element which must be made to enter much more largely into our criticism of Greek poetry generally than has hitherto been the case:—no poet, in the blooming days of Greece, courts to be *read*. Put Pindar against Wordsworth, and carry out this remark for private edification. But as to the tragedy, how much the *song* lived in the associations of the ancient people, as the principal idea in the word, is attested to the present day, by the fact that *τραγῳδία* is the Romaic for a song generally. To the people, doubtless, the chorus always was, and continued to be, the literal centre and nucleus of tragic interest. Euripides, in his loose fashion, might indeed in many cases seem to embosom the sacred action in music, rather than inspire it by music. But the rosy cloud-car of the fairy might be a more lovely thing to look on than the fairy herself; and Æschylus at least took care that the chorus should not only outwardly by public sympathy, but inwardly by artistical development, command the chief share of public attention. In the Seven, the Choephoræ, the Suppliants, the Eumenides, the chorus forms the very muscle and bone of the composition. So also in the Œdipus Coloneus of Sophocles; there the action is little; spun out, in our opinion, somewhat unnecessarily by the colloquy with Polynices; but, as it is, take away the nightingale notes of the equestrian groves, and you take away the soul, the inspiration, the living patriotism and religion of the piece.

We do not flatter ourselves to have said any thing new, when saying that the chorus is a great distinguishing characteristic of the ancient Greek drama, which has often been misunderstood by the moderns, and sometimes, but always unsuccessfully, attempted to be revived. We only wish to bring the matter into more decided and unquestioned

prominence; and to entreat the Greek student on all occasions to bear it in mind, and not allow himself to be confounded by the thousand meaningless criticisms which pert or silly people will make on that branch of ancient literature, apart from this habitual rudder, as we may say, of judgment. Potter was so puzzled with the beautiful Mysian wail that winds up the sad lamenting of the Persians (in all respects without doubt one of the most curious dramatic remains of antiquity) that he pieced the fitful responses of sorrow into a magnificent high-sounding speech (after the manner of English translators); and Bishop Blomfield, in more recent times, has also shown so much ignorance of the musical principles of criticism by which the Greek tragedy must be judged, that he fell plump into the old pond of Sicelias, and declared the Persians to be, if not altogether, at least half a comedy—perchance a farce. Did the bishop ever hear the Litany chanted in an English cathedral? or, that most simple and most beautiful of musical and religious things, the Litany of the Saints in a Roman Catholic chapel? These Litanies are exactly such a thing as the amœbæan chant in the Persians, the wail or *κοῦμος* in the Seven, and many the like passages in our present text-books of ancient opera; for such and nothing more are the valuable remains of antiquity, by the editing of which our Porsons and Elmsleys, our Moncks and Burgesses, have acquired such an adventitious and artificial certainly, but not therefore (as flash wits imagine) altogether undeserved and unlaudable immortality. A Greek tragedy was a sacred opera; very different from a modern opera indeed in several respects, as Schlegel has well cautioned, but still an opera; and an opera in which dance or *ballet* occupied a no less important position than song. It is vain, therefore, for any scholar to attempt understanding these old text-books by Greek words and glossaries alone. A living sympathy with dance and song must be brought to the work; and with that, even what Porson despaired of, an organic reconstruction of the choral chants may possibly yet be effected. The Germans have done much in this line already; let us, if we are men, gird up our loins and do more.

But the difference must be well marked. Between Metastasio and Æschylus there is a gulf of 2000 years; and all the leap, moreover, that intervenes between a soldier who fought at Salamis, and a courtier who served at Vienna. We are not, however, concerned here to consider the difference in quality between the piping of an Italian eunuch and the roar (*βῶν ἀγῶος*) of a

Greek soldier. What touches us is to observe that while the modern opera is, strictly speaking, a musical drama, i. e. an action represented by singing characters, the Greek goat-song, as its etymology sets forth, may be more properly described as a dramatizing hymn, mainly and essentially a song sung in character, and illustrated by appropriate recitations; a Pindaric Ode, to borrow a simile from chemistry, out of which some of the principal mythical figures have been shaken loose and precipitated; but they never acquire such a circulation and independency as to form of themselves a perfect and complete imitation of an action. They swim in the musical element, which originally held them in solution, and are not recognised as having acquired any separate tenure of existence. A sea of song introduces, accompanies, and finally swallows up their ephemeral movements. Nor are these movements ever altogether free from a characteristic air of lyric solemnity and epic formality, the certain evidence that they are not the native and unfettered children of nature. They declaim rather than speak; they describe action oftener than they act. In Metastasio the reverse of all this holds. Cut away those pretty little corollaries, or perhaps only blooming epitomes of the dialogues called airs; and a perfect and regular drama still remains, constructed according to all the principles of complex plot, interesting situation, natural and impassioned dialogue, which Aristotle and the ancient critics wished to make, and Shakspeare and the modern stage-poets have made, of theatric exhibitions. A modern musical drama is not the less perfectly a drama because it is musical; and the reason of this is, partly that it is not religious (of which anon), and partly that it is not mainly and essentially lyric and choral, as the Greek opera was. To the true nature of a sacred ode that calm and sustained dignity belongs, more contemplative than impassioned, which we trace alike in the Odes of Pindar and in the choruses of Æschylus. These choruses are calm Pindaric odes essentially, dramatic outbursts of passion incidentally. The Fishermen in Masaniello are not more essentially dramatic than the supplicating Virgins in the first chorus of the Seven, or the Chase of Furies in the opening scenes of the Eumenides, when “the scent of human blood laughs in their nostrils” (*ὁσμη βροτῶν αἱμάτων μοι προσέλα*). But it is the calm dignity of religio-philosophical contemplation that stamps the main character on the Æschylean chorus particularly, as on the tragic chorus generally. Music, indeed, of the highest kind (as we see in the German

music) has something solemn and contemplative in its very nature: it is a most unlikely thing that the early singers even of Dionysiac choruses practised the mimic craft of De Begnis and Paltoni; rather let us think that the Dionysiac odes, in their earliest state, though substantially drinking songs, were, like the German Burschen songs of the same nature, interpenetrated throughout with a deep and solemn feeling of religion;* at least the element of ludicrous and sportive mimicry was early separated from the nobler part, and relegated into the region of comedy and farce (Satyrs); and one thing seems perfectly certain, that the fevered activity and dramatic St. Vitus fits of our modern stage-singing must be kept far apart from all conceptions of the ancient Dionysiac ode: the twitter and the chatter, the splutter and the roar, the vaulting and somerseting, the furious chase, the licentious intoxication, the scream and the agony, and the convulsion of sweet sounds, as they are made a public spectacle of by the Donizettis and Mercadantes of the modern opera, had, we may imagine, no counterpart in the sacred solemnity of the heathen hymns.

Second in importance scarcely to the musical is it to observe, and keep in view, the religious and sacred character of the Greek tragedy. To the neglect of this plain and obvious principle (however generally it may have been recognized in the abstract) much childish and unedifying prate, under the name of criticism, may be traced. Whenever the catastrophe of a Greek drama is brought about by the intervention of a god, our profane modern critic, without discrimination, immediately bawls out "*Deus ex machina*" (an echo from the Epicurean Horace); and expounds with much self-satisfaction how much more cunningly he would have brought about the *dénouement* by means of the interworking of human motives and the intertwining of human fates. And Göthe, no doubt, in his Iphigenia, brings about the catastrophe nicely enough, without the aid of Pallas Athene; but whether Euripides would have done wisely to have wound up this sacred legend without the solemn seal of a goddess (though, perhaps, the goddess should have been Artemis, and not Athene) set upon its authenticity, is a different question. The Greek drama was not a drama of human motives, but a drama of divine dispensations.

πολλαι μορφαι των δαιμονιων,
πολλα δ' ιελπτως κραινονσι θεοι.
και τα δοκηθεντ' οὐκ ετελεσθη,

των δ' αδοκητων πορον ευρε θεος
τοιονδ' απεθη τοδε πραγμα.*

This tragic colophon, so commonly affixed to the Euripidean plays, is in fact the proper motto and symbols of every Greek tragedy. Not the wit of man, but the wisdom of God brings about the issue.

των τ' αδοκητων πορον ευρε ΘΕΟΣ.

And they who blame the Greek tragedies for this characteristic, firmly lamenting that they are "too much mixed up with their tales about oracles, and the vengeance of the gods" (Blair)—do in fact act as wisely as if they should blame the Bible for not being a fashionable novel. The Bible of Greece was Homer and the lyric poets; the tragedians did nothing more than cut slices from this bounteous feast of popular poetry. *Τεμαχη των Όμηρου μεγαλων δειπνων*, as Æschylus said: their tragedies were our sermons, and their stage was our pulpit. Suppose the pious old adjunct of mysteries and moralities not to have been choked in its first infancy, but to have grown up along with the other parts of our Church service:—suppose at our great Church feasts—The Nativity, Lent, Easter, &c. (answering to the *ανθεστηρια*, &c. of the Greeks)—sacred lyrical dramas, comprising the most interesting events in the history of the Church from Adam to Martin Luther, to be annually exhibited with all the pomp of appropriate costume, and all the solemnity of genuine cathedral music;—suppose these dramas written by Southey, not by Mrs. Hannah More: for Iphigenia put Jephtha's daughter; for Dionysius put Noah; for Hercules put Samson; for Caucasus put Calvary. Bring all this *as part of the Church service*, before joyful throngs of worshipping spectators, and you have a clear idea of what the Greek tragedy was to the Greeks. The spectators of the Dionysian operas did not seek for the stir of a bustling action, or the excitement of a curious plot; they sought for the calm religious contemplation and the devout religious enjoyment of ancient, familiar and venerated traditions. To this feast of devotion, dramatic strength like that of Æschylus, dramatic skill like that of Sophocles, might be highly serviceable. But a luxuriant lyrist and fluent rhetorician, like Euripides, might do the work creditably, and even, in some cases, gain the palm. It is not to be calculated how

* Many are the deviations of the Gods, and many things they bring about contrary to expectation; things that seemed probable have not come to pass, and for things improbable God hath found out a fulfilment. Such hath been the course of this story.

* Of this we have a fine example in the beautiful Burschen air, "*Von Hohern Olymp*."

modern critics have confounded themselves and their readers by the vicious habit of comparing the Greek goat-song with that perfectly different thing—the modern tragedy. They have thus with much *negative* wisdom (a commodity in which critics are too apt to deal) assured us that that which is round is not square, and that which is square is not round. But they should have set the ancient tragedy against the modern oratorio, or the few sacred dramas which Metastasio exhibited at Vienna, and they would have seen in what a pitiful case we moderns are as to this matter. We have made no such noble use of our Bible as the Greeks made of their popular poetry. This is a lamentable fact. One epic poem we have constructed out of the three first chapters of Genesis; but the rest of our sacred history, so far as our poetry is concerned, lies an uncultivated garden. Our stage alas! is essentially profane; and not profane only, but deep-leprosied through many years with immorality, from which disease it is only now recovering. Our pulpit again, we may well say, is too sacred, too formal, too didactic, too abstract, too general, too vague, too remote from the sympathies of everyday life. Our religion seems somehow strangely at war with the poetical arts; the sisterly bond of beauty and piety has been broken; the graces of the human soul will not intertwine in friendly dance; and famous preachers have declared publicly that the door of the theatre is the mouth of hell. The division of labour has triumphed here also: the fingers of the pin-maker have become very expert; but the heart of the man is barren and unfurnished: the holiness of life is felt only amid the solemn gloom of the Church, before the formal discourse of the preacher; its luxuriant pomp unfurled only amid the empty glitter of the stage. Is it meant that this divorce shall remain for ever?

And yet we seem hasty. We have been drawing conclusions from Protestantism, and not from Christianity. No doubt a Madonna of Raphael is as glorious a wedlock of art and religion, as the *Œdipus Coloneus* of Sophocles. And of this that sect of English theologians, who are called "Oxford Papists," seem to have some notion. Keble is a poet; he looks for unity and harmony; he seeks to smooth down all religious differences by the sweet music of poetic reconciliation; not like some stern Calvinistic Northmen, whose religion blows like a sharp east wind, as if reason required to be killed eternally. But matters are mending. Even out of Presbyterianism George Staney has drawn poetry; witness those divine pictures!

—The fire is not the less hot within Hecla, because its outer rind is ice. What the sterner phase of Protestantism wants is not poetic fire, but the diffusion of that fire. Our tree is hung with fruit, but the fruit is not mellow. Our present may be hard to bear, but there is no fear of the future. Our pulpit shall certainly become less scholastic, our stage more sanctified.*

There are some men to whom what we have said on the sacred nature of the Greek stage may appear strange. These men find nothing but a low and degrading superstition in the ancient drama; and "mere fatality and blind chance" seems a very different thing from God. Alas for the narrow sympathies of those souls who can share in no worship beyond the four walls of their own conventicle!—Alas for the barren harvest of that eye which feeds continually on its own seeing, and on its neighbour's blindness! Were I to extract the whole of Christianity from an *Æschylean* chorus, what harm? Is the noonday light which I enjoy less precious because it once shone through the darkness? There are plants whose fruit is ambrosia, but whose root is poison; is the fruit the worse for that? But where is this theological poison of the Greek drama, and what ode celebrates the triumph of fatality and blind chance? Where is the human soul upon earth whose basest superstition is not inhabited by a divine soul of piety?—unless, perhaps, that poor brother of the kangaroo in New South Wales, who, if they tell true, believes in a devil only—not in a God. But the Greek tragedy is instinct with the profoundest and most genuine piety. And what they call fatality and chance is a mere imagination of the one-sided modern critics, borrowed from a one-sided contemplation of one section of the Greek tragedy, the *Labdacidan* story. Herodotus also speaks of chance, but it is a *θαια τυχη*, as he qualifies it, and merely another name for what we call special providence. And as to necessity, the tragedians never worship a God of this name, but they say in language, which any Christian might adopt,

* On the subject of the stage generally, and especially on its connection with religion both in ancient and modern times, the reader will find some admirable observations in the article of the *Edinburgh Review*, formerly quoted.

† We think the famous ode in the *Alcestis* to *Necessity* is a solitary example in the Greek drama; and it is only another way of saying "All men *must* die!" What Prometheus says again he says for himself, not for *Æschylus*. And if in any passage of ancient writers Jove is said to be inferior to Fate, it is always open to inquire, whether an *inward* or an *outward* Fate be intended.

Ἀλλὰ γὰρ τι ταῦτα θρηνῶ καὶ ματὴν οὐρομαι ;
 Τὰς γὰρ ἐκ ΘΕΩΝ ἀναγκὰς θνητὸν οὐτὰ δει φερεῖν.

That is to say, the divine decrees are unalterable, and we ought to submit to them with cheerful resignation. These lines are the last of the Phœnissæ ; and the prologue of the same play shows how little reason Blair (Lecture xlv.) had to complain of the influence of "mere fatality and blind chance" in the Labdacidan story.—

Μη σπείρε τέκνων ἀλοκα ΔΑΙΜΟΝΩΝ βία—

"Do not sow the seed of children contrary to the will of the gods." So sounded the words of the oracle to Laius ; and is it not strange that a Christian divine should have found no theology here, but the atheism of blind chance, when his own faith is founded upon the ever-memorable denunciation—"In the day that thou eatest thereof thou shalt surely die !" And as to the circumstance that Œdipus personally was innocent of any great crime, do people die in life or the drama merely because they are guilty ? And shall the punishment of sin be just even to the third and fourth generation in the mouth of Moses, and

αἰὼνα δ' ἐς τρίτον μὲνει

be unjust in the mouth of Æschylus ? But the fact is, that no stern iron necessity, but the slow-gathering storm of divine wrath for unrepented sin, hangs solemnly over the doomed ones of the Greek drama. So the chorus of the Eumenides expressly sets forth—

ἐς τὸ παν δε σοὶ λέγω
 βῶμον αἰδεσθαι Δίκας
 μῆδε νιν
 κερδὸς ἰδὼν ἀθεῶν ποδὶ λαῖξ
 ἀτίσης·
 ποῖνα γὰρ ἐπέσται·
 κυρίον μὲνει τέλος.*

No homily could be more clear. The Greek dramatists are truly far more express on this point than the moderns. Admire Hamlet who will ; then let him denounce the blind fatality of Œdipus if he dare.

The more profoundly indeed that we study the religion of profane antiquity the more clearly shall we comprehend that Christianity was not so much a new religion, as the blossom and crowning triumph of all previous religions—a consoling truth that makes the heart of a man expand, and the Divine particle within him leap for joy. So the Greek tragedy—the Æschylean in particular

teems every where with a half-developed Christianity. The whole play of the Seven against Thebes, for instance, is a practical commentary on the song of the Blessed Virgin, "He hath sheweth strength with His arm : He hath scattered the proud in the imagination of their hearts." It is a mistake to suppose that humility is a virtue peculiarly Christian. The only great Christian virtue which the Greek drama cannot comprehend is that divinest one—"Love thine enemy !" "To hate with one soul,"—*καὶ στυγεῖν μίᾳ φρενὶ*—was the maxim of ancient citizenship ; and no wonder. So speaks flesh and blood ; and we Christians, both priest and layman, have hitherto for the most part contented ourselves with *preaching* this *new* commandment ; the practice of it is very hard and presses too closely on the strongholds of the old Adam of selfishness. Nor even in the more unlikely region of theological doctrine is the Greek drama barren of the most pious lessons. The Polytheism of the Æschylean chants is a thing comparatively innocent ; even as the Roman Catholic religion in the head of an educated Roman Catholic is a very different thing from the same religion in the head of an ignorant and bigoted individual. The inferior deities of the Æschylean theology are only the viceroys of the one Eternal Sovereign of the Universe. Jove is the fountain of all divine energy : Pallas Athene is wise only because she inherits her father's wisdom (*καρτὰ δ' εἰμι τοῦ πατρὸς*). Apollo does not prophecy his own wisdom, but the wisdom of Jove—

(Δίος προφήτης δ' ἐστὶ Λοξίας πατρός)—

and from Jove comes the "sweet-speaking voice" (*ἀδυεπὲς φωνή*) of the Delphic oracle. Jove is the all powerful, the only free ; the eternal ruler (*αἰώνιος κρείων ἀπ᾽ ἀνστος*) : wise and the teacher of wisdom ; just and the avenger of injustice ; prayer-hearing and the protector of suppliants. There is in fact no attribute which Christian philosophy ascribes to God, that Æschylean poetry does not ascribe to Jove ; with this difference, however, that we boast to read the statute book of the law in stereotype ;—the Greeks were guided by the inward polarization of the heart only, or the loose fluttering Sibylline leaves of an uncertain mythic tradition.*

The Greek tragedy is not merely the musical and declamatory representation of a sacred history ; it is also, as we stated arti-

* "But chiefly I tell thee reverence the altar of Justice, nor, when gain tempts thee, venture to kick it with godless foot ; for punishment hangs over sin : the appointed end remains."

* Those who imagine we have overstated the value of Æschylean theology will read over the seven plays with *impartial* study ; and for the sake of easy reference and useful comment they may take along with them *Klausen's* valuable tract "*Theologumena Æschyli Tragici*." Berlin, 1829,

culately above, the theological development of a religious idea ; and the apprehending of this idea is often of far greater importance to the right estimate of the play than any criticism, however just, on character and incident. But the idea is not always to be found in a single play ; it is obscurely hinted at in the outset, and often only finds its full development in the final play of a series. Here the matter of the tragic *Trilogy* becomes of primary importance. It is impossible in this regard to separate the *Agamemnon* and the *Choephoræ* from the *Eumenides* ; and the *Prometheus Bound* must remain a riddle to every reader who does not scheme out for himself a *Prometheus unbound*, to reconcile the religious discords of the piece. Happily this may now be done without losing ourselves in the transcendental wanderings of Percy Bysshe Shelley. The Germans have pioneered here, and opened a hopeful vista. On the *Trilogy* as applied to *Æschylus*, Professor Welcher of Bonn has written a somewhat fanciful, but not therefore to the wise a less edifying work.* Herr Gruppe also has justly devoted considerable space to this interesting subject ; and no student who wishes to penetrate beyond the surface of the *Æschylean* drama will neglect to make himself master of these luxuriant German speculations. Herrman, as usual, has brought his square university logic to bear against the fruitful poetry of the Welcher and Müller school. But fairy forms will not allow themselves to be fingered by every mathematical man who would plane down the rich garden of things into a chess-board. Welcher is a scholar with wings, and Herrman will have the learned world laugh solemnly at the capers of the mad bird ; when it were wiser and worthier in this generation of prose to thank God that there appears such a thing as a winged spirit at all.

There is one matter remains ; the matter of declamation ; but that is shortly discussed. Euripides is prominently remarkable for this characteristic : but *Æschylus* and *Sophocles* also are not free from it. The ease and variety of natural dialogue is altogether wanting in the measured solemnity of tragic phrase. This seems to have arisen from two causes. The dialogues were altogether wanting in the original drama of *Phrynichus* ; where there was only one speaker, formal recitation necessarily supplied its place. *Æschylus* introduced a second speaker : but it would have been quite contrary to the organic laws of poetic

development had we found in him a sudden leap from the formality of cothurnate declamation to the vivacity of natural converse. Accordingly his dialogue bears every where the stamp of its undramatic origin. What shall we say to the long narrations in the latter half of the *Prometheus* ? We behold here drama in its most infantine and imperfect state ; but one step above the monologue of *Phrynichus*. *Prometheus* discourses ; he does not talk : the action not only flags, as we say of a dull play, but there is no movement at all. In *Sophocles*, again, considerable point and pith of dialogue will often be found : witness the admirable parry and thrust between *Œdipus* and *Tiresias*. But even *Sophocles* is far from being free from long, formal, stilted expositions, that betray at every turn the incomplete and half-developed character of the Greek drama, when viewed strictly as drama. In such a state of things is it at all wonderful that Euripides was able without much offence to pass off for stage dialogue his formal law pleadings and philosophic argumentations ? But another cause was also at work in preserving to the Greek tragedy its measured and deliberate pace. The religious chant which composed the nucleus of every sacred drama, was, of course, in its own nature measured and solemn ; and good taste required that the character of the declamation should be in keeping with the character of the singing. Here again we see the influence of the chorus ; the solemn character of the ode passes into the dialogue ; and even in the human heroes of the Greek drama we seem in every move to hear, not the walk of a man, but the tread of a god.

In the preceding observations, from the vast extent of the subject, we have been compelled throughout to give hints rather than disquisitions, to allude rather than to expound, to give the results of observation rather than the facts observed. But what we have given, we have given as the fruit of much laborious study ; and perhaps the Greek student will not take it amiss, if we endeavour, in conclusion, to supply a few hints which may possibly be of use to him in prosecuting his private researches on this subject. Greek is now out of fashion ; and there are many reasons why it should be so : it remains, however, indisputably true, that next to our native treasures, no foreign literature will yield such a rich mine of poetry as the Greek. The drama, in particular, for its thorough nationality, its lyrical luxuriance, its moral purity, its religious dignity, is unexampled in the history of the human mind. No lover of poetry will grudge twelve months of his most vigorous

* Die *Æschyleische Trilogies* Darmstadt, 1824.

youth to the study of the Greek language. In twelve months, however, the business should be done :* and if it now occupies as many years, and the fruit produced nevertheless is meagre and dry, the uninitiated seem perfectly justified in estimating the profit as far beneath the outlay ; for it certainly does seem a strange thing that men should spend twenty years in learning that Plato was a great philosopher, and yet sell their souls, like unlearned men, to Jeremy Bentham, and the great goddess Utilitaria after all. With like practical consistency we spell out the choral chants of Æschylus, and we append learned titles to our names to show that we have done so. But what becomes of choral singing in our families, in our public assemblies, in our sacred congregations ? Does it not seem a much wiser thing to sing English choruses in our schools than to read Greek ones ? The uninitiated ask these questions, and they are entitled to ask them.

The great error seems to be that we go to Oxford for Greek instead of to Athens ; we hold pedantic converse with the dead, when we should enter into bonds of fraternity with the living. Greek is not a dead language ; any newspaper printed in Athens or Nauplia will prove that. Why then do we study it as a dead language ? Why do we spell a thing painfully after six years' study, which we might learn to speak fluently in six months ? If the student is wise he will not confine himself to Oxford. Next to a residence in Athens, a semestre of a German University—Berlin, Göttingen, or Munich—will prove of the greatest advantage to the student. He will find an inspiration in the presence of Böckh, Müller, and Thiersch, which does not breathe forth from the arid atmosphere where Burney is praised and Porson worshipped ; and where conjectural criticism is trumpeted as the sole end and aim of Greeks, and Greek as the sole end and aim of human nature. Conjectural criticism truly ! not merely “ pots to mend !” as Whewell says ; for unless it be mended the pot will hold no broth :—but an useless and unprofitable disfigurement of ancient pictures by officious and conceited modern restorators—the ceremonial service of a superstitious devotee, who stitches away with minute diligence at the petticoat of the Virgin Mary, and boasts thereby to be doing God and humanity good service. Of all things the Greek student will most carefully avoid the barren puerili-

ties of the Porsonian school ; the pedantic jargon of Iambus and Trochee, monotonously doled out by men who have no music in their ear, and no poetry in their soul. Better to abstain from Greek altogether than to become either buyer or seller in the scholastic retail trade of syllabic technicalities ; perform idol worship to the skin of a “ dead vocable ;” and lose sight of the noblest ends in the pragmatistical fingering of the puniest means.

With regard to the Greek drama, in particular, the student will find six aids of especial importance : some of them indeed altogether indispensable.

1. The study of life and nature.
2. The study of English drama.
3. The study of music—modern opera and oratorio ; and Böckh's Pindaric discourses.
4. The study of ancient art, as suggested by Schlegel.
5. The study of ancient religion and mythology.
6. The German critics.

On these things we cannot at present afford to enlarge. Their propriety will be manifested to the slightest reflection. Only on the last point we shall allow ourselves a few words. We attach the greatest importance to the study of the German critics ; not because these writers are altogether free from puerile fancies, and sublime observations ; but because they are always rich in those qualities of mind, of which our native criticism (in this department at least) is peculiarly barren—imagination, ingenuity, and enthusiasm. From the Greek critics little is to be got ; from the French less. Aristotle was a philosopher ; a square scientific man. No person can read his poetry without disappointment. We do not here speak of its fragmentary character ; but of its whole style and tone. It is a criticism of the mere understanding ; it is entirely destitute of poetical sympathy ; it dissects and lays bare one scientific idea, but does not recreate and reorganize the whole poetic vegetation ; it sees nothing but *πλοκή, περιπέτεια, and αναγνωρισμός* in the drama ; precisely that for which it is least remarkable. But Aristotle was a Greek ; and not only a Greek but an ancient ; he could not see the wood, as the German proverb says, for very trees. The French critics will amuse more than they will edify : all that they could say about the Prometheus was, that they held the plot was “ monstrous.” And yet so barren were we of native intellect that these men were our guides in classical belles-lettres more than half a century, till Schlegel

* “ We do amiss to spend seven or eight years merely in *scraping together so much miserable Latin and Greek* as might be learned otherwise easily and delightfully in one year.”—Milton, letter to Hartlib.

wakened us out of our dreams ; and along with Wilson, Carlyle, and other free and generous spirits, exercised a most beneficial influence on the critical literature of this country. He helped to banish the prior cant of "patronizing criticism ;" and lowered the factitious importance of the small kid-glove men who measured the giants of nature's growth as tailors measure kings, by externalities only. The criticism of reverential sympathy—the alone positive, the alone profitable—now lifted up its voice. Exaggeration and mystification were of course here and there its concomitants. When a ditcher digs, bubbles will come out of the earth, but he does not dig for bubbles. Profitable work was done ; men sought with humble inquiry to ascertain what things are, not with vain pretence of dictatorial wisdom to tell us what things are not ; Schlegel was triumphant in all the reviews ; and not in the reviews only ; but into the *cramming* books of the Oxonians also he came, and seemed nearly as important a person as Porson ; the sentence about the Niobe and the Laocoon was hawked about small periodicals and young men's essays, as frequently as Rory O'More is whistled through the street ; Aristophanes was no longer a buffoon ; and professor Scholefield, in Cambridge, expounded *Æschylus*.

The great merit of Schlegel was that with a decided and fearless front he beat down the strongholds of the French dynasty ; and revindicated to nature, earnestness, vigour, and fire, their rightful empire over refinement, trickery, elegance and correctness. A courtly lie was no longer to be preferred to a plebeian truth ; and this is the essence of all good criticism. In Germany Schlegel had been preceded by Lessing—the only man, says Menzel, among an age of women. But here when Schlegel came amongst us in 1826, the age of women was not yet extinct ; our classical criticism was almost a blank ; and to twirl on the finger ends a few crisped sentences on a Greek tragedy, was naturally the exclusive monopoly of classical prigs ; sound and substantial men had something more useful to do. To Schlegel we owe almost every thing that our classical criticism is or attempts to be. It is the part of national gratitude to acknowledge the obligation.

What now has Herr Gruppe done that may be regarded as solid gain, after the notable labours of his meritorious predecessor ? The first thing that strikes us here is that in all main points and general views he completely coincides with Schlegel. The same enthusiastic admiration of Sophocles, the same cheap estimate of Euripides, is

everywhere visible, and may be said indeed to constitute the soul of his criticism. *Æschylus* he seems somewhat to depreciate, but only *seems* ; he is evidently writing partly with the view of counteracting the influence of that one-sided partiality for *Æschylus* which characterised the late ingenious labours of Professor Welcher. Bating this, his estimate of the father of tragedy will not be found to differ materially from Schlegel's. It is in the more curious and comprehensive illustration of detail that we are to seek for the peculiar excellences of Gruppe's book : and here we find him a real treasure. Schlegel could give only the most general views ; he was lecturing not on the Greek tragedy, but on drama generally : some slips of judgment in matters of detail were scarcely to be avoided on this extensive theme ; and in these matters Herr Gruppe, with a somewhat ostentatious zeal, but at the same time with the handling of perfect mastership, is never slow to set him right. We may instance the two Euripidean plays, *Iphigenia in Aulis* and *Rhesus* ; both of which Schlegel had unworthily criticized, but which have received a full and triumphant vindication from our new critic. If on these and on other occasions, not Schlegel only, but Herrman also is somewhat severely handled, they have themselves to thank. Herrman has uniformly spoken the language of scholastic dictatorship ; and Schlegel, always too legislative, has of late exhibited himself publicly as a coxcomb and a gasconader. The one character might have passed with a smile, the other deserves the lash. To the student, however, the book is all the better for this spice of polemical severity ; the clash of opinions stirs his energies, and forces him to form an independent judgment.

Gruppe is in all things a thorough German ; and herein the great excellence of his book lies. The Germans are born critics. Their literature, by a process the reverse of what history generally presents, was founded on criticism. Lessing was a critic ; Herder was a critic ; Göthe was a critic. But the criticism of the Germans is not the barren work of the understanding. Perfect reproduction of the lost Beautiful, and perfect reverential sympathy with it when reproduced, is the ambitious mark of its activity. It is a thing essentially vital ; essentially creative. It collects and orders the scattered dry bones of antiquity, and breathes into them the breath of life. It is poetry, but poetry working on nature mediately only, through books. It is based on learning and inspired by enthusiasm ; it demands imagination to re-create, ingenuity to invent and

supply, a free fancy to revel joyfully in the thing re-created. It has no kinship with the barren, arid formalism of the Porsonian school; it is a thing peculiarly German; a plant which grows naturally, and healthily, and lustily only on German ground. Let this be examined into quietly, and it will be found to be the case. The Germans are the proper priests of literature; we need not be chary to allow them this merit; so long at least as we can boast more gods, and the one supreme Shakspeare, before whom Göthe, like our own Byron, wisely trembled.* But being priests, the Germans may be truly said to be indispensable to all who seek to join generally in the public worship of literature. Let us confess it honestly—a great part of our best criticism at the present day is only an echo from Germany; an echo sometimes indeed waning louder and more solemn, like thunder among the hills, but sometimes, also, as unlike the original impulse as the prattle of a child to the deep-mouthed utterance of an oracle. Coleridge is a German, Carlyle is a German, Wilson also is a German, though unconsciously; the Oxonians do nothing at this present moment but translate German; and even the newspapers quote Jean Paul Richter.

We cannot more fitly conclude these hasty observations than by adding from Gruppe a passage, where he brings out strongly the general poetical worth of the Greek drama, and specially its connection with ancient popular poetry; and compares both with the less perfect development of *national* literature in modern times.

"I seem to discover two great steps in the development of Greek poetry, the nature and relative position of which has hitherto been very superficially considered. The product of the first is the Homeric ballads, and was rounded into completeness by the *διασκευαται* of Pisistratus. But contemporaneously with this stable record of tradition, I recognize the existence of a luxuriant many-branched tree of popular fables growing up and cherished in the bosom of the people—the circle of cyclic poetry. Part of this poetry also is prematurely committed to writing; but petrification does not follow, as in modern times has so generally been the effect of printing popular legends. The free vitality remains, and the rich mythic materials find their rhapsodists in the tragedians, and their Homer in Sophocles. The Greek tragedy grew out of the immense circulating mass of mythics, as naturally as Homer grew out of the Iliadic and Odyssean le-

gends; the architecture is perfectly homogeneous—colonnade piled upon colonnade.

"This organic completeness, indeed, this fair and perfect growth of the national vitality, is that characteristic of the Greek poetry which will make it interesting to cultivated minds as long as men live to take an interest in the spiritual development of men. We have here two perfect chains of popular poetry, springing out of the same mythic bed, each advancing in its own separate line of unbroken energy to the culminating point of perfect organization; the history of literature presents nothing to compare with this. The great Greek poets do not stand isolated and alone, like our modern writers; the bonds of popular sympathy have not been unloosed; Homer, Pindar, Sophocles, stand in essential organic relation to each other; in this connection alone can they be estimated or enjoyed. Never since the Greek times has poetry received such a full, free and uniform development. Neither stunted in any limb, nor starved in the general quality, we behold here a full-grown pattern specimen of poetry, an example to all ages of perfect poetical propriety.

"Our own Niebelungen presents us with a modern repetition of the Homeric poems; and the Book of Heroes may be looked upon as the cyclic poetry belonging thereto; but out of these elements no German drama has arisen—a few story plays of popular theme, by this or that isolated writer, do not compose a national theatre. Even out of the memory of the people these fables have now for the most part vanished. To drag them out of oblivion with learned preparation will now avail nothing. The most national poet would come too late to re-animate the popular poetry of Germany. Besides, no national poetry was ever created by a leap; Sophocles worked upon Æschylus, and Æschylus upon Phrynichus; with us every one must strive after originality, and work out of himself.

"In England, however, I see something analogous. Shakspeare, like Sophocles, stands at the head of a line of popular poetry, neither so long, nor so rich, nor so unbroken as the Greek, but still national. Into his hands the legends of far centuries travelled; some of them even came through the hands of previous dramatists; forming a perfect analogy to the course of Greek poetry; as in Lear, Measure for Measure, the Merchant of Venice, the Taming of the Shrew, &c.; and in the most he had Italian novels and curiously constructed tales to weave from. However many singularities and excrescences he exhibits, we may still trace in him that inward organization and rounding so characteristic of popular poetry. Shakspeare is indebted for these advantages to the circumstance that England was less harsh and bitter in her religious views than other kingdoms of Europe. The religion of the Elizabethan age could tolerate poetry. We Germans suffered first from the rigorism of the Protestant Reformers, then from the keen

* See Göthe's confessions on this subject in Eckermann's *Gesprächen*, Foreign Quarterly Review, October, 1836. To compare Göthe to Shakspeare, is to compare a garden to the world.

edge of the thirty years' war; we were cut off violently from all connection with the inexhaustible riches of popular poetry. To the evil influence of theological strife, the pedantry of what is called classical learning was added. We have been studying Greek for three centuries only to learn at this time of day, that while the letter of Greek erudition has been nursed with most curious care, the spirit of Greek poetry lying at our feet has been systematically trampled on, and has now perished in one branch beyond redemption."—*Ariadne*, p. 654.

ART. II.—Schubert: *Reise im Morgenland, in den Jahren 1836 und 1837*. (Travels in the East, in 1836 and 1837.) 2 Vols. Leipsic, 1839. With an Atlas of Illustrations.

FEW of those who remember the publication of Chateaubriand's "Itinéraire de Paris à Jerusalem" have forgotten the sensation it produced, by laying before the public eye those lands of history, romance, and fable, which, once the terror and aversion of Europe, had since become the superstitious wonder of the vulgar, and a long desired field for literary enterprize. The tribe of tourists that followed, with their tales of personal peril and their national peculiarities, contributed towards keeping up the interest their talented precursor had awakened: earlier travellers had only for a time excited attention from the learned. Those times are past, and with them much of the danger and novelty of oriental travel. The wonders of nature and art which adorn these interesting regions have proved so fruitful a theme, that even the details have too often become insipid from repetition. We select, however, on this subject, an author of well-known literary attainments, nor can it be denied that the work before us is by far the most interesting and important he has produced. Dr. Schubert is a gentleman both in spirit and language, and the perspicuity and elasticity pervading the work must raise the author to a tolerable rank among the tourists of his day. He possesses one important advantage even over Chateaubriand, viz.—a thorough knowledge of natural history.

Hence arise a force and brilliance in his description of scenery, of atmospheric or celestial phenomena; and which, joined with active incident and humorous anecdote, preserve untiring the interest of the work. There is another striking feature in the book before us, which it shares with the "Itinéraire

de Paris," namely, pious and exalted Christian sentiment; but in this the author is inferior to Chateaubriand, as the copy to the original. The images of the latter have a lofty if not sublime character, which assimilates them to the words of the prophets, while the thoughts of Dr. Schubert belong to the species which has sprung up so recently in Bavaria, and threatened to spread over Germany, in opposition to the sentiments of the northern or Protestant districts. How it happens that Bavaria has constituted herself the centre of such catholic propagandism is foreign to our purpose; but we must do our author the justice to say that he has not interfered with this or any other essentially political question, except perhaps where he most obsequiously flatters the Austrian government, which is supposed to be at the bottom of this movement.

M. Schubert's work is dedicated to the Queen of Bavaria, and a voluminous introduction follows, occupying thirty-four pages with utter uselessness. It is entitled "Whither wilt thou go?" and consists of certain juvenile dreams, or inspirations as the author would call them, which might be interesting from Shakspeare or Byron, but are insipid and irrelevant in a star of so much less magnitude. We should, however, act unjustly towards the author were we to say much about his *Einleitung*—for the simple reason that we have not read it, which we apprehend will be its fate with most English readers.

In the beginning of this tour we are informed of what may assist us in understanding some parts of the work, that Dr. Schubert was in his fifty-seventh year when he undertook the journey, and that he was accompanied by his wife, a draughtsman, and two young scientific friends, of whom we may not have occasion to speak hereafter, invading as they do with their mineralogical hammers even the rock of the mystic Horeb and Sinai.

But it is time to relinquish these general remarks, and bring the writer forward in his own person.

At page 44 occurs a good description of the author's feelings whilst travelling through Bavaria. It seemed as though the body only, and not the mind, was journeying towards the holy east; nor was it till he arrived in the environs of Enns (in Austria) that the latter also became engaged in the enterprise, and accepted the conviction that its ardent longings were about to be accomplished.

"Perhaps," he says, "the elements of this desire lie in the historical interest of the spot. Here existed that ancient nursery of the Christian faith, which even in the first century was illuminated by the dawn of a spi-

ritual day, while the countries around were buried in the deepest night. Here stood the Roman Laureacum (Lorch) which received the feet of the messengers of salvation even in the second century, which the inspired Bishop Maximilian filled with the word of life, and where the Christian warrior and hero Florian found in the waters of the Enns, the death of a martyr."

Our next extract is a description of the scenery in these regions.

"The country from its rich plantations of fruit trees resembles a large and beautiful garden. In the afternoon at Stienberg we were all powerfully struck with the solemn beauty of the surrounding landscape, and the quiet loveliness of the autumnal day; the distant peaks of the Styrian Alps, covered with new fallen snow and glittering in the setting sun, the refreshing breeze that waved the luxuriant foliage, and far and near the mellow notes of the evening bells, seemed like harbingers not only of the day of rest which the morrow would bring forth, but of the approach of that land which had given to us our corporeal and spiritual Sabbath."

In Vienna the author amused himself with inspecting the spots which have become memorable by the repulse of the Turks in that city; but we pass on to notice one of those adulatory passages alluded to in our earlier remarks, and it certainly is singularly characteristic of the present state of Germany, that a Bavarian of some rank, like Dr. Schubert, should be extolling (even in his own country) not the services rendered him by the diplomatists of his own monarch, but those of a foreign prince. The passage is as follows: "The powerful effect of these introductions and recommendations, which were given me by the chancellerie of state of his Highness Prince Metternich, taught me that the great and comprehensive mind of this statesman is capable of combining the care of the general good with that of the individual; and that while he strives to guide the powerful stream for the welfare of his country, a poor little rivulet is not beneath his assistance."

The journey from Vienna down the Danube in a steamer affords the traveller few objects of importance; but the following description of the Castle of Vissegrad is worthy of notice. "In the afternoon the thunder clouds like mountains towered over the forest of Bakony, whilst the sun in his progress above them illuminated the antique structure of the triangular Castle of Vissegrad (Plenteswurg) in which the noble Matthias Corvinus passed a time of joyful repose in the company of our great countryman, the astronomer Regiomontanus." This latter name is of the more importance at present

from the prominent place it occupies in the life of Columbus, adverted to in M. D'Humbolt's *Examen critique sur la Geographie du Nouveau Continent*. The country about old Orsova and the baths of Hercules near Mehadia is interesting on account of the classical recollections they awaken, and the description of our author evinces the clear and precise investigation of a naturalist. "A wooden bridge crosses the little rivulet of Jardedizka, which is rich in trout and other fish; then appear those ancient and seemingly immutable trenches said to be the commencement of a Roman aqueduct; next the fertile though rock-bound valley of Mehadia with its handsome buildings and romantic scenery invites the traveller to a lengthened stay. Here are the first traces of the baths of Hercules; and although the surrounding country may want the charms of the gardens of the Hesperides, it bears abundant marks of the force of the patron demi-god. Wild heaps of fallen mountains, torn from their places by the waters of the Czerna, are strewed about the meadows, as though the hero had commenced but not completed the task of clearance; or as if some vast deluge had received from these rocks a momentary check, till gathering strength from opposition, the invading flood had forced them before it and scattered them in its way." Mehadia, a township of about 1500 souls, lies on the left bank of the Bella Laka on the site of the Roman *Ad Mediam*.

On the Temples of Hercules and Esculapius which existed here some centuries ago, were found inscriptions which proved that the baths of Hercules were known to the Romans and much esteemed for their healing qualities. They are situated about forty minutes' walk from the township, on the rocky banks of the Czerna. Large masses of granite cross the bed of the river, especially on the right, and form rocks in the higher ground; from the fissures in these proceed the vapours which, condensed in the upper part of the mountain over beds of granite, marlschist, and a compact grey chalk, form the springs that supply the salubrious baths. There are twenty-two springs in all, and their presence is announced to the traveller by the smell of sulphuretted hydrogen, which has been compared to the effluvia of putrid eggs. The quantity of heated water thus supplied is considered inferior only to a few of the springs of Iceland. Zimmermann has calculated exactly the quantity of water produced by nine of these springs, and found it to be on an average 6525 cubic feet in the hour, or one-half more than all the aqueducts of Paris conveyed to that capital.

"We walked along the verdant meadows which border the river Czerna, or under the shadowy roof of the forest up to the cataract. On the green turf and in the shadow of the shrubbery the *crocus speciosus* appeared with its modest blossom: the vine in a wild state is not uncommon on the borders of the forest, and the fig-tree is seen near the spring of Hercules growing in the open air: a singular proof of the mildness of the climate. Among the birds we fancied we heard that poetic inhabitant of the East the wild cooing-dove (*columba risoria*)."

This is a fair specimen of the style of our author, surrounded as he proceeds on his journey with classical and historical recollections, and seizing every interesting and characteristic feature with some feeling and judgment. But the East affords scenes and incidents more striking and important.

At length the author finds himself on the Black Sea, surrounded by the waves of the Bosphorus:

"The impetuosity of the stream of the Danube at its entrance into the Black Sea is so great as to carry the current of fresh water to the distance of three miles and a half due east from the mouth of the river; as may be discovered by the taste. Steering south we soon lost this companionship, and entered at once the vast domains of the Black Sea. It is remarkable that even in calm weather the waves of this immense expanse of water rise to a considerable height: this arises from its being the point where the high peaks of the Caucasus on the east, the girding mountains of Hæmus and Olympus on the south, and the sloping plains of the countries of the Danube on the west and north, finally commerge, and by the powerful contrast of plains and mountains keep the atmosphere in a perpetual excitement; the Black Sea being on a great scale what the squares in front of one of our lofty domes is on a small one, that is, the focus of a constant fluctuation of wind and weather. The mind of the wanderer is moved like the waters round him when he finds himself for the first time in the vicinity of the stage that witnessed the deeds of the youth of mankind; there in the east arose the Sun of the second cosmic day (*zweiten Weltages*) of history, and there in the distant south it reached the meridian zenith."

Dr. Schubert often descends to observations and remarks that bear the stamp of his usual quaint acuteness.

"The next morning most of us tried in vain to rise from our beds to cast our longing eyes towards that spot on the western coast where Tomi, the ancient capital of Scythia Minor, was situated, and where the banished Ovid sung the pains of expatriation. We had been seized with that affection

which resembles death without ever producing it; that disease in which we feel oversatiated without having tasted food, tired to death without having walked, and intensely active even in repose. It seems as if we were no more ourselves, but the tossing ship; the brain seems fastened to the top of the mast; and in lieu of thoughts, the rattling wheels and cracking engines have taken possession of the head, and deprived it of all power to keep itself erect. In this state we passed the fine day of the first of October."

The author gives a detailed account of Constantinople; we forbear to insert it, but lay before our readers the following description of Stamboul while ravaged by that Oriental scourge, the plague.

"In spite of the clamour of the violin and the yelling song of the gypsies resounding through the streets of Galata, it did not prevent the appearance of a goddess who could be prompted by such music to dance and merriment. A protracted drought, emaciating for months past the countries on both sides of the Bosphorus, had strewn ashes upon the head of the queen of Turkish towns; the plague had appeared in the interior with a violence unknown for many years, and a severe conflagration had lately consumed some of the most showy streets. Whilst we were in Pera a fire broke out in some of the miserable Turkish huts situated on the south-easterly slopes towards the Arsenal, and we were only saved from the impending danger by the resolution of some Franks who came to our assistance. If we walked towards the sea through the grove of cypresses near the Turkish cemeteries, we were sure to meet the porters bearing away the dead in hair-blankets, and the harbour was full of small boats loaded with coffins and biers. Beyond the town near the shore towards Daud Pascha the graves of Moslemite saints were covered with pieces of cloth or rags from the body or bed of persons about to die; by this custom, as dangerous as it is disgusting, this people hope to obtain an amelioration of the disease. In all the streets and bazaars of the town the Franks might be seen wrapped in oiled silk, and carrying long sticks with which they hoped to avoid contact with the Turks; and when you entered the house of a Frank, or returned home after a walk in the town, you were shut up in a chest like a cupboard, which had only a small aperture for breathing, and fumigated to suffocation by a basin of coals placed at your feet."

From Constantinople, our traveller continued his voyage to Smyrna, a country equally interesting to the antiquarian, the naturalist, and the historian; we shall therefore extract his description of the locality of the primitive churches of Asia.

"A visit to some of the seven communities of Asia Minor, to which the Epistles of the Apocalypse are directed, was from the first one of the favourite plans of our pilgrimage; and we had determined to proceed from Constantinople to Brussa, and thence through Pergamus and Thyatira to Smyrna; but before I say anything of our visit to these localities it may be well to give a slight general survey of a country so replete with the memorials of infant Christianity. The fertile villages in the vicinity of Smyrna were the principal seats of these communities; among them, Hermes and Mæander stand pre-eminent; the former is now called Sarabat, and is situated north of Smyrna, and the latter, now called Meinder, lies to the south of the same peninsula. But in this ill-fated land not only the hand of man, but the power of nature has also contributed to remove the memorials of the past. The once sonorous spring of Marsyas in the midst of ancient Celæne, and which formerly flowed near the castle and park of Cyrus, has formed a different track, through the rock; and this probably as far back as the earthquake of Mithridates. The more recent Apamea, now called Dinare, and built by Antiochus Soter, near the town of Celæne, dismantled by repeated earthquakes and Turkish invasions, is now scarcely distinguishable; and, in short, the ruins of one church and a number of Christian sepulchres, are almost the only relics which time and violence have spared. The church with its adjacent burying-place is situated on a mountain, which is represented by traditions founded on Sybilline verse, as the Ararat of the Noachic flood.* The city of Ephesus, properly so called, is divided from Ajasluk by a fertile plain intersected by dykes. The pavement and quays once destined for the loading of ships prove that the bay, now encumbered by sand and soil, was at one time navigable up to the town; but the shores of the sea have been pushed backwards for above two miles, and the structures and harbours of Ephesus are for the most part buried in sand.

"We rested for awhile in the proscenium of the great theatre, and recalled the time when the now deserted and silent space had echoed to that shout of excited thousands, 'Great is Diana of the Ephesians!' Opposite, or perhaps by the harbour, stood the temple of the goddess; that deity whom all Asia, nay all the ancient world, had worshipped; that temple which had won from mankind admiration and wonder. Now no knee is found to bow before the majesty of the goddess; the very site of her temple is doubtful; but He whose disciple was persecuted in that theatre is worshipped as the salvation and the solace of man. A voice of conviction from within rose to our lips and said, 'He will never change.' The wind vibrated through the ruined walls, and moan-

ed through the deserted town; it seemed as though the voices of the dead had answered 'Amen.'"—p. 301.

From Smyrna our traveller took shipping for Alexandria. He was informed by the captain of the vessel in which he sailed, that there would be only thirty passengers, including his own party; this seemed quite sufficient for so small a craft; but he found too late the worthy seaman had omitted to mention that one hundred extra passengers were to accompany the aforesaid thirty in the same vessel. "Sweet are the uses of adversity," and the doctor found the crowded ship a favourable opportunity for studying the character of the Turkish hadshis or pilgrims who constituted the principal part of his fellow-passengers. After sufferings grievous to one so unused to hardships, the traveller arrived in Egypt, the land of mystery and primeval knowledge, the land of Moses, Plato, and Herodotus, now the goal of idle rambles and would-be sentimentalists. When the party landed it was about Christmas, which is considered a favourable time for travelling, as being the finest part of the Egyptian spring; and in consequence the stranger becomes inured to the climate, before the intense and dangerous heat of the summer months. The doctor indulges in a long description of the appearance of the country during his journey up the Nile, as well as the effect produced by the call to prayer from the minarets. We shall pass over these, and bring him at once to Cairo. Mehemet Ali has made himself of late so important to the European powers, that, politically speaking, his kingdom has become, in a manner, a part of the European conclave. We give the Doctor's account of his visit to the court.

"As early as the third day after my arrival in Cairo, I was summoned to an audience at the Viceroy's, to whom I had been very kindly recommended by the Austrian consul. It was yet the time of the Ramadan, and the hour appointed was eight o'clock. Accompanied by the Austrian consul and my friend Mr. Lieder, we rode through the city with a portly Janissary, as a sort of protection to our little cavalcade, and a number of servants bearing flambeaux walked by our sides. This was the first time I had seen the town, except by daylight, and I could scarcely be said to see it now, for it was in a state of total darkness till within a short distance of the palace, where it was lighted by lanthorns and pans of burning pitch. The squares and gates, as well as the staircase leading to the palace, were brilliantly illuminated. As we entered, was heard a cheerful song performed by a chorus of manly voices. I imagined there must be a

* Compare Arundel, Discoveries in Asia Minor, vol. p. i. 208, et seq.; Bochart, Sac. Geograph.

concert; but it turned out to be the song of the Life Guards, which they sing at the prayer Esche, or the time when darkness has set in.

"It happened that I had chosen for this audience an especially important day. The Islamite clergy of Cairo, muftis and ulemas, as well as the other superiors of sects and clerical orders, were sitting in the great antechamber, about to make the Viceroy the visit of the Ramadan. In the saloon there were several Arabs and Turks of distinction, intermixed with Franks in Oriental dresses. A deputation from Mecca was also there; they might be distinguished by their yellow faces and high turbans, and, as my friend remarked, by the atrociously contemptuous glances which they cast upon our party. There was moreover an ambassador from the Sultan, who, at the time we arrived, was engaged in a private interview with the Viceroy, at which not even the interpreter in ordinary was present.

"This important interview having terminated, the Turkish ambassador appeared, surrounded by his own suite, and escorted by a crowd of high officers. The private physician then went to his Highness for a few minutes, after which the deputation from Mecca received a short audience, and the high clergy of the city a still shorter one. Much ceremony was observed, and I remarked that the clergy were saluted most respectfully by the courtiers and soldiers as they passed.

"After a short pause we were conducted by Austin Bey, the interpreter, to the audience room of his Highness. He was seated to the right in a corner of the saloon upon a splendid divan; next to him in the same corner, but upon the divan of the other side or wall, the seat of honour was assigned to me. The fine Oriental greeting of the Viceroy, 'Praise be to God for thy happy arrival,' was translated by Austin Bey into French, by, 'His highness rejoices at your happy arrival in Cairo,'—and thus, I was afterwards informed, he mutilated the whole conversation. Mehemet Ali is a well-formed hale old man, with piercing glittering eyes: his countenance expresses not only conscious authority, but that moral power which talent and unconquerable resolution impart. I thought much of what I had heard and read of him, but his countenance seemed to say, 'You see the plough which cuts the furrows, but not the power that moves it.' We were scarcely seated when a page presented to us a tumbler of fresh water, with several preserved fruits on a splendid dish; another handed us the long pipe, upon the tobacco of which a glowing coal was placed. The bowl was supported by a small pedestal to save the valuable carpets. The large amber mouth-piece of the pipe I received was richly ornamented with diamonds, and the tube covered with other jewellery; so much so, that I was informed by Mr. Champion that its value was about 8000 dollars; the Pasha has pipes of still greater value.

Whilst these civilities were going on, his highness made honourable mention of our king Louis of Bavaria, and as the contents of the European papers are regularly communicated to him, he seemed pretty well acquainted with what was passing. He knew that we had a rail-road in Bavaria, which, however, he seemed to consider more extensive than it really is, and that a canal was in progress to connect the Danube and the Rhine: and he told me that he also intended to construct a rail-way and an extensive canal. He was farther aware of the magnificent buildings lately erected in Bavaria, and asked me whether I had seen the works of the new Mosque he was building near his palace. He asked me the age of our king; and when he heard his majesty was still in the prime of life, and had lately visited Greece and Asia Minor, he expressed a wish of seeing that monarch at Cairo, which he said surpassed Smyrna in beauty. I could not perceive the slightest lassitude either in the appearance or manner of the Viceroy, although he had rigidly kept the fast of the Ramadan through the whole day, and had been engaged four hours in giving audience to his ministers, and subsequently to the foreign ambassadors."

We have had occasion to notice before that though Dr. Schubert is not a professed antiquary, he is keenly sensible to the feelings which the remains of former days inspire; and his work abounds with notices and descriptions of localities bearing an historical interest; but instead of filling it with dry and technical details, interesting only to one class of readers, he makes it agreeable to all by intelligent research in every science, by the poetry of his scenic descriptions, and by the quaint and pleasant style of his general remarks. His description of the far-famed Sphynx will be interesting to all, while it might satisfy the cravings of any but the antiquary.

"We stopped at the immense image of the Sphynx, whose size, compared with the human body, is as the palm to the rush: it is situated in the vicinity of the great Pyramid, but compared with this primæval work of Memphitic greatness, appears only like a subordinate servant; it is also the youngest of them, having been hewn out of the rock by command of Totmes the Fourth, who reigned only 1446 years B.C. The face of the mighty ruin has been mutilated by the barbarism of succeeding ages; the nose is completely gone, having been formed probably of a different material, and attached to the head by a groove, which is still visible. The rock underneath its neck has suffered from the influence of the weather; and of the altar and entablature found between the fore legs of the Lion, not a vestige remains, the sand of the desert having filled up every excavation. If there be any sepulchral

caves in or below the Sphynx, the entrance to them must be by cavities hidden at a great depth, for no aperture is visible either in the image or in the surrounding rocks."

We pass over the author's description of the great Pyramid, as well as some ingenious remarks which accompany it, and bring him at once to his journey through the desert. Chateaubriand observes that "St. Jerome was a man for whom nothing but Rome or the Desert was adequate;" and we must pay our author the compliment to say that he seems never more at home than in this last and trying situation. The reader must not expect any harrowing adventures or hair-breadth escapes; the desert through which his party had to pass is, compared with some others, safe and easy of access. National character, moreover, is not a quality thrown aside with the dress, and accordingly, among novel and interesting descriptions of scenery and incident, we find a pretty regular report of the daily meals. With the exception of a few roughings, our South-German has not forgotten the comforts of life, and has made himself, as we said before, perfectly at home.

"As the diurnal course of the camel resembles that of the sun in uniformity and duration, so the two indispensable attendants of the desert assimilate in the perfect silence of their movements; to avoid collision the camels march in a single straight line with a considerable interval between each, so that conversation is out of the question; and thus we proceeded on our way in a silence by no means inimical to the feelings inspired by the scene. Every traveller, however willing to pay for alimentary comforts, finds himself here circumscribed to mere nutrition. Our food consisted of the ship's biscuits and hard Arabian bread, which we had brought with us for the first meal, and rice boiled in water for the second, or dinner which was eaten in the evening. We had also a little coffee without milk for breakfast, and occasionally, but very rarely, our rice was seasoned by the addition of dried fruit, and still more rarely by the flesh of goats or mutton, which always converted the meal into a festival. Water, sometimes mixed with date raki, constituted our beverage; and if the eye was insensible to the slime and other impurities, and the palate to the bitter salts with which it was impregnated, it received the same relish from the burning thirst which hunger communicated to the simple food. As, generally speaking, a place where there was a little vegetation was selected for our evening's rest, the rambling from one solitary mimosa tree to another afforded in the last hours of the day the same amusement which under other circumstances would have been derived from inspecting a beautiful botanic garden. Our sleep, notwithstanding the hardness of our couch, was as light as the

covering which surrounded our bodies; and the first lowing of the camels, anxious for the untying of their compressed joints, never failed to awaken us to the renewal of our journey. At times a bird which had its dwelling in the prickly gum-tree would sing the reflex of the glory of the Lord, the returning light which reflected itself in the dew; or else the note of the swift Arabian grouse would sound from some adjacent rock; and while the caravan was in motion several of us who were fond of singing accompanied the tread of the camels with the sound of our voices."

We hasten to the conclusion of our author's ardent aspirations, the vicinity of Palestine.

"It is scarcely necessary for me to state the first object of my attention after my arrival at the Convent of Sinai. The old prior, venerable from the spirit of love, conducted me to the church, situated, if tradition may be trusted, on the spot where Moses beheld the flaming bush and received the heavenly commission. There was no need for the imploring glance which the old man cast upon me as he bared his feet, for I had already recalled the words which had issued from that place, 'Take thy shoes from off thy feet, for the spot whereon thou standest is holy ground.' How long I remained kneeling in the dimness of the chapel I cannot tell; it seemed like a resting of the soul after its many years of wandering, and tears may be shed, which speak not eternal suffering, but the joy of Heaven. I conceive that every traveller who ascends Mount Sinai, and enjoys as we did the prospect from its summit, will acknowledge that no other view in the world will bear the comparison. On three sides may be seen the ever-varying sea which surrounds the high lands of the Petrean peninsula; beyond, but far distant, appear the mountain ranges of the Arabian and Egyptian coast: no forest, or mountain-meadow, no murmuring brook or peaceful hamlet, soften and vulgarize the scene; all is stern, grand, and sterile; and if there is not the hurricane or the thunder-storm, there is a silence scarcely less impressive. The Desert of Sinai, with its pinnacle of rocks, is one of the unmoved and remaining mark-stones of the third day of creation, when the Eternal said 'Let the waters under the heavens be gathered together into one place, and let the dry land appear.' It is a memorial of the time when the power of free life was not, and there existed but that law which assigned to the crust of the earth its formation, to the water its affixed limits.

"Nowhere can the crystalline formation of rocks be more extensively studied than here, where no products of the later days of creation cover and conceal those of the third; where sandstone and lime are nowhere to be seen, and where the seams of wacke and basalt are seen running for miles like black veins through the structure of the mountains."

The succeeding chapters are filled with

descriptions of the environs of Akaba, the mountain of Hor, and other places in or near Palestine. But we approach with our traveller the most important spot of his peregrination,

"And see illuminated by the red glare of the evening sun, the Castle of Zion, the Temple of Moriah, the city of Jerusalem itself. 'God will provide himself a lamb,' was the answer of the trusting patriarch when he approached the rock of Moriah to sacrifice his only son, and the prophecy was fulfilled in the agony of the Son of Man on Golgotha, and his last triumph on the Mount of Olives. The pilgrim who nearly two thousand years after beholds Jerusalem at a distance, may well stand still to contemplate the past and future movements of mercy and holiness which, now clear as the tear of penitence, were once seen dimly though incarnate on yonder sun-gilt mount."

We have not hitherto spoken of the atlas of forty drawings, which accompanies Dr. Schubert's work, and which has been published by M. Bernatz, who accompanied the doctor during his peregrination. This artist must be passionately fond of his profession, and several passages of the work dilate upon the inconvenience to which he exposed himself for the sake of attending to his avocation. Persons familiar with most of the spots represented, praise highly the faithfulness of the drawings.

In the foregoing review we have wished to make every allowance for the feelings of an enthusiast: but truth compels us to observe that these are often greatly exaggerated, and in several instances absolutely approach the ridiculous; as in the Hudibrastic conversation and echoes of the two shores of the Hellespont, and the bombastic apostrophe to the Sphinx.

-
- ART. III.—1. *Self-culture. An Address introductory to the Franklin Lectures.* By W. E. Channing. 8vo. Boston: 1838.
2. *Record of Conversations on the Gospels, held in Mr. Alcott's School, unfolding the Doctrine and Discipline of Human Culture.* 2 vols. 12mo. Boston: 1836.

It has not unfrequently been made matter of comment and sometimes even of ridiculous reproach that America is yet destitute of an antiquity. True it is that no baronial ruins frown gloomily over her soil, no feudal legends are associated with her green savannahs, no wily cardinals, no soldier prelates

are immortalized in her history. She has no codes and institutions tracing their origin to immemorial time, and yet exercising a despotic sway over the minds of her present population. It may be that this state of things is regretted even by the Americans themselves. We could fancy that amidst all their self-gratulations on the equality of rank, and their pride in an all-pervading democracy, there is still some pining for patrician ancestry; some yearning towards venerable dust; some envy of those European nations which would invest with eternal sanctity the good old *regime* that their barbarous predecessors condescended to patronize.

Others on the contrary say—"Happy America! where the spirit which announces constant development as its law is not curbed by the forms of vanished centuries; happy land! where growth is not heterodoxy, and progression impiety."

Such language might some years ago have been to a certain extent true with respect to America; we could wish that even now it may furnish a correct description of her general state. Nevertheless the tendency of the Transatlantians to adopt in many instances the prejudices and follies of older nations is only too apparent.

Simultaneously with the exhibitions of philosophic progress to which we shall hereafter have occasion to advert, manifestations of bigoted hostility have been revealed, which are but gloomy auguries of a country's mental and moral independence.

If there be one name identified more than another with American literature it is that of Dr. Channing. Well does he deserve the rank which he has acquired. Our admiration for the power which he displays in minute analysis, in the depth of thought and the grace of illustration, is accompanied with a reverential love for his moral dignity, and the constant benevolence which has invariably used for its own high purposes his diversified mental endowments.

Amongst the benefits which Dr. Channing has rendered his countrymen, there is none greater than the inward direction which he has given to the public mind.

Whilst we should be the last to advocate popular apathy towards the political aspects of the day; whilst we are bound to assert that there is a stern necessity imposed upon every member of a state to exert his influence in repressing aristocratic domination, or democratic mutiny; whilst we confess that no man ought to be indifferent to the character and tendency of those institutional laws by which he is governed—we are on the other hand bound to contend that the reform which most avails to produce a people's hap-

piness and elevation is not the result of political interposition; or of national manifestoes. True, the blood of Hampden and Russell was not idly shed. Worthy of immortal honour are they by whose righteous self-sacrifice national redemption has been purchased. But individual liberty and personal happiness belong to a higher sphere than that which is subservient to outward government. This last has but a negative power. Its province may be to restrain the exhibitions of crime. The creative power whereby intelligence and goodness are generated, is not to be identified with the operation of external circumstance. Neither loveliness of clime, nor prosperity in commerce, nor impartiality in the laws, have singly, or in the aggregate, the faculty of producing happiness. The soul and its experiences are not made up of amalgamated finite ingredients. These are but the subordinate elements which she combines at her pleasure, moulds at her will, and using them as she lists, ordains them to stand forth as her representatives—never as her rulers.

To return, however:—whilst we have been labouring only for political amelioration, whilst the reform of institutions has been the sole object of our labour, Dr. Channing has pointed out the necessity of internal improvement; an improvement which can be realized by the human being at any time and under any circumstances. In this utilitarian age it is most agreeable and refreshing to hear the evolution of the moral and mental faculties treated of as that which is eminently essential to man's practical happiness. In "Self-Culture" occurs the following passage:—

"Self-Culture is practical, or it proposes, as one of its chief ends, to fit us for action, to make us efficient in whatever we undertake, to train us to firmness of purpose, and to fruitfulness of resource in common life, and especially in emergencies, in times of difficulty, danger, and trial. But passing over this and other topics, for which I have no time, I shall confine myself to two branches of Self-Culture, which have been almost wholly overlooked in the education of the people, and which ought not to be so slighted.

"In looking at our nature, we discover among its admirable endowments, the sense or perception of beauty. We see the germ of this in every human being, and there is no power which admits greater cultivation, and why should it not be cherished in all? It deserves remark, that the provision for this principle is infinite in the universe. There is but a very minute portion of the creation which we can turn into food and clothes, or gratification for the body; but the whole creation may be used to minister

to the sense of beauty. Beauty is an all-pervading presence—it unfolds in the numberless flowers of spring—it waves in the branches of the trees and the green blades of grass—it haunts the depth of the earth and sea, and gleams out in the hues of the shell and the precious stone. And not only these minute objects but the ocean, the mountains, the clouds, the heavens, the stars, the rising and setting sun, all overflow with beauty. The universe is its temple; and those men who are alive to it cannot lift their eyes without feeling themselves encompassed by it on every side. Now this beauty is so precious, the enjoyments it gives are so refined and pure, so congenial with our tenderness and noblest feelings, and so akin to worship, that it is painful to think of the multitude of men as living in the midst of it, and living almost blind to it, as if, instead of this fair earth and glorious sky, they were tenants of a dungeon. An infinite joy is lost to the world by the want of culture of this spiritual endowment. Suppose that I were to visit a cottage, and see its walls lined with the choicest pictures of Raphael, and every spare nook filled with statues of the most exquisite workmanship, and that I were to learn that neither man, woman, nor child ever cast an eye at these miracles of art, how should I feel their privation? how should I want to open their eyes, and to help them to comprehend and feel the loveliness and grandeur which in vain courted their notice? But every husbandman is living in sight of the works of a Divine Artist; and how much would his existence be elevated, could he see the glory which shines forth in their forms, hues, proportions, and moral expression! I have spoken only of the beauty of nature, but how much of this mysterious charm is found in the elegant arts, and especially in literature? The best books have most beauty, and they win their way most surely and deeply into the soul, when arrayed in their natural and fit attire. Now no man receives the true culture of a man in whom the sensibility to the beautiful is not cherished; and I know of no condition in life from which it should be excluded. Of all luxuries, this is the cheapest and most at hand; and it seems to me to be most important to those conditions where coarse labour tends to give a grossness to the mind. From the diffusion of the sense of beauty in ancient Greece, and of the taste for music in modern Germany, we learn that the people at large may partake of refined gratifications which have hitherto been thought to be necessarily restricted to a few."

It is a good omen for the best interests of mankind that a man like Channing is heard pleading, not for better circumstances, not for fairer objects, not for legislative changes, as things which are most essential, but for awakened perceptions, and for cultivated faculties. Such philosophy is not, perhaps, entirely novel; for centuries there has been

a vague surmise flitting across the surface of society, that all that which is exterior to man would assume a different and far nobler aspect if diviner influences were introduced into his existence. Generally speaking, however, such doctrine has been considered rather as a pleasing speculation for poetical fancies, than as a lofty faith to be realized in practice. It is therefore an ennobling spectacle to behold a man of the highest talents and the profoundest thought insisting upon the adoption of that faith as a necessity of the most practical nature. It must now be declared most openly, that man has not the power to alter the current of events, but that he has the capacity to give to it a *character*. The operation of circumstance, governed by its own inevitable law, can neither pause nor vary in accordance with the conflicting desires of men. Ambition must still suffer disappointment, avarice must still endure the bereavement of its treasures: but whether ambition and avarice shall still persevere in their unquiet course depends upon the election of man himself.

Urged by the same philosophic spirit as that which actuates Channing, though with deeper experience and still higher aims, we find Mr. Alcott labouring in the American field. The labours of Mr. Alcott, as an educator, are chronicled in "The Record of a School," and developed in "The Doctrine and Discipline of Human Culture." For the practical results which have followed his exertions we must refer the reader to the first-mentioned work. We have to do with him as an Author and as a Philosopher.

We have stated that the views of Mr. Alcott are deeper and his aims higher than those of Dr. Channing. To this circumstance may be traced the persecution to which Mr. Alcott has been recently subjected; Channing is just within the range of popular will. Although he travels far in advance, he is never out of sight. He appeals to the intellect. He requires, as the condition of success, persevering cultivation rather than determined sacrifice. He insists upon the improvement of what *is*, rather than upon the advent of that which *is to come*. He urges the result as a labour which man may accomplish by his own resolute industry. He points to the true goal, but he neither shows us the nearest way nor the most facile mode of travel. He bids us cherish the sense and perception of beauty:—but what beauty is; what is the source of its being; what the essential to its development, he fails to divulge.

Mr. Alcott, on the contrary, declares that the utmost improvement of a *partial* nature can never produce a worthy result; that the

most skilful training which contemplates the perfection of a nature can only accomplish its end in accordance with the law in that nature; that if it be evil and self-willed, its capacities, when unfolded to the highest degree, will partake of its baneful character. Mr. Alcott requires the higher natures to be evolved in the lower, and rightly attributes the rectification of evil to the evolution of latent good. To *create* the good is beyond the sphere of education: its highest power is to aid in the development of it. Mr. Alcott estimates genius as a talent existing in all men, inseparable from goodness as from wisdom. Conscience is the voice of genius, and obedience to conscience is the only condition under which man can be moulded into the image of his Maker. To the operation of indwelling conscience, and not to that of outward science, Mr. Alcott looks for success. He values not virtue at second-hand, he will have it from the source. Hear him declare this himself, in the introduction to an exquisite volume, entitled "Nature," published in Boston in 1836.

"Our age is retrospective. It builds the sepulchres of the fathers. It unites biographies, histories, and criticism. The foregoing generations beheld God and nature face to face; we through our eyes. Why should not we also enjoy an original relation to the universe? Why should not we have a poetry and philosophy of insight and not of tradition, and a religion by revelation to us, and not a history of theirs? Embosomed for a season in nature, where floods of life stream around and through us, and invite us by the powers they supply to action, why should we grope among the dry bones of the past, or put the living generation into masquerade out of its faded wardrobe? The sun shines to-day also. There is more wool and flax in the fields. There are new lands, new men, new thoughts. Let us demand our own works and laws and worship.

"Undoubtedly we have no questions to ask which are unanswerable. We must trust the perfection of the creation so far, as to believe that whatever curiosity the order of things has awakened in our minds, the order of things can satisfy. Every man's condition is a solution in hieroglyphic to those inquiries he would put. He acts it as life, before he apprehends it as truth. In like manner, nature is already, in its forms and tendencies, describing its own design. Let us interrogate the great apparition that shines so peacefully around us. Let us inquire to what end is nature?

"All science has one aim, namely, to find a theory of nature. We have theories of races and functions, but scarcely yet a remote approximation to an idea of creation. We are now so far from the road to truth, that religious teachers dispute and hate each other, and speculative men are esteemed un-

sound and frivolous. But, to a sound judgment, the most abstract truth is the most practical. Whenever a true theory appears, it will be its own evidence. Its test is, that it will explain all phenomena. Now many are thought not only unexplained but inexplicable; as language, sleep, dreams, beasts, sex.

"Philosophically considered, the universe is composed of Nature and the Soul. Strictly speaking, therefore, all that is separate from us, all which Philosophy distinguishes as the NOT ME, that is, both nature and art, all other men, and my own body, must be ranked under this name, NATURE. In enumerating the values of nature, and casting up their sum, I shall use the word in both senses;—in its common and in its philosophical import. In inquiries so general as our present one, the inaccuracy is not material; no confusion of thought will occur; NATURE, in the common sense, refers to essences unchanged by man; space, the air, the river, the leaf. Art is applied to the mixture of his will with the same things, as in a house, a canal, a statue, a picture. But his operations, taken together, are so insignificant; a little chipping, baking, patching, and washing—that in an impression so general as that of the world on the human mind, they do not vary the result."

Would to Heaven that it were not necessary to *import* into England such truthful poetry as this.

We cannot do the reader better service than to quote from "Nature" those sentences which seem to us peculiarly illustrative of Mr. Alcott's mind.

THE INFLUENCE OF SPIRIT OVER NATURE.

"Nature always wears the colours of the spirit. To a man labouring under calamity the heat of his own fire hath sadness in it. Then there is a kind of contempt of the landscape felt by him who has just lost by death a dear friend. The sky is less grand, as it shoots down over less worth in the population.

MAN IN CONNECTION WITH FACTS.

"All the facts in natural history, taken by themselves, have no value, but are barren, like a single sex. But marry it to human history, and it is full of life. Whole Floras, all Linnæus's and Buffon's volumes, are but dry catalogues of facts; but the most trivial of these facts, the habit of a plant, the organs, or work, or noise of an insect, applied to the illustration of a fact in intellectual philosophy, or in any way associated to human nature, affects us in the most lively and agreeable manner."

RECOLLECTIONS OF THE COUNTRY IN CITIES.

"The poet, the orator, bred in the woods, whose senses have been nourished by their fair and appealing changes, year after year,

without design and without heed, shall not lose their lesson altogether in the roar of cities, or the broil of politics. Long hereafter, amidst agitation and terror in national councils, in the hour of revolution, these solemn images shall reappear in their morning lustre, as fit symbols and words of the thoughts which the passing events shall awaken. At the call of a noble sentiment, again the woods wave, the pines murmur, the river rolls and shines, and the cattle low upon the mountains, as he saw and heard them in his infancy. And with these forces, the spells of persuasion, the keys of power, are put into his hands."

LOW USE OF NATURAL ILLUSTRATION.

"We are thus assisted by natural objects in the expression of particular meanings. But how great a language to convey such peppercorn informations! Did it need such noble races of creatures, this profusion of forms, this host of orbs in heaven, to furnish man with the dictionary and grammar of his municipal speech? Whilst we use this grand epithet to expedite the affairs of our pot and kettle, we feel that we have not yet put it to its use, neither are able. We are like travellers using the cinders of a volcano to roast their eggs."

IMAGINATION.

"Imagination may be defined to be, the use which reason makes of the material world."

SPIRIT, THE TEACHER OF MYSTERIES.

"The best read naturalist, who lends an entire and devout attention to truth, will see that there remains much to learn of his relation to the world, and that it is not to be learned by any addition or subtraction or other comparison of known quantities, but is arrived at by untaught sallies of the spirit, by a continual self-recovery, and by entire humility. He will perceive that there are far more excellent qualities in the student, than preciseness and infallibility; that a guess is often more fruitful than an indisputable, and that a dream may let us deeper into the secret of nature than a hundred concerted experiments."

ADVICE AND ANTICIPATION.

"As fast as you conform your life to the pure idea in your mind, that will unfold its great proportions. As when the summer comes from the south, the snow-banks melt, and the face of the earth becomes green before it, so shall the advancing spirit create its ornaments, and carry with it the beauty it visits, and the song which enchants it; it shall draw beautiful faces, and warm hearts, and wise discourse, and heroic acts around its way until evil is no more seen."

From the foregoing extracts the reader will perceive that Mr. Alcott holds the high-

est manifestations of genius to be the result of great moral development. An opinion this which is more and more winning its way into the hearts of thinking men. We have long considered the intellect as a mere representative faculty. It portrays the moral nature. Intellect is, in fact, an artist who may choose the line of colouring and the style of execution, but not the character of object. When essential goodness or morality prevails in the human being, the objects to be expressed are the noblest which intellect can delineate. This last, standing in the presence of sublime originals, feels a sublime enthusiasm which never animated it in the representation of inferior archetypes. The truths to be illustrated are of so glorious a character that the painter feels compelled to exercise the highest capacities of his art. The more he gazes the more he loves. With no unholy worship he bends his gaze upon forms of light and love. He absorbs their beauty. He sits at their feet with serene devotion, and surrenders all self-activity; it appears as if he rather depicts what he is than what he sees. The true artist is ever one with the ideal which he portrays. Not a few candidates for public fame have succeeded by representing old opinions in a new form. Those who gild the common-place are generally better received than those who place on record new facts in the history of human progression. Nevertheless, it is only when original objects are illustrated by original representation that the true man of genius is revealed. Mr. Alcott agrees with the poet, who declares that

"Man's soul is mightier than the universe."

According to our author the human mind includes all exterior nature. The phenomena of creation are all representative of mental phenomena first promulgated in the human conscience. In proportion, therefore, to man's perfection is his capacity to appreciate the harmony which reigns through the universe. In excellence of character is found the solutions of those enigmas which the great Sphinx, Nature, constantly propounds. The infidel is baffled by the apparent contradictions which the world offers to his view, for the simple reason that he is himself a contradiction; the intuition of good which exists in his mind being perpetually denied by the rebellion of his intellect. Whenever religion, as a creed, is sincerely adopted, it is adopted because religion as a genuine experience is present to the mind of the believer. The infidel errs in seeking to reverse the law in creation, which requires intellectual perceptions to be dependent upon moral feelings.

One of Mr. Alcott's coadjutors is Mr.

Ralph Waldo Emerson. This gentleman, taking up the stigma which has been cast in the teeth of his countrymen, has called upon them to be no more reflections of European minds, but to seek in the recesses of their own for originating power. Such power, he affirms, is resident in every human being. He requires that books shall no longer be quoted as texts, but adopted as suggestions to the creative impulse. In this respect the tone of his mind differs widely from that of the British literary public at the present period. We worship science; he idolizes genius alone; he urges to originate; we love also to accumulate. He prizes the law; we the phenomena which represent it. With him man is noble as the oracle of spirit; with us as the lexicon of matter.

It is true that one act of creation is more glorious than a thousand acts of memory. Yet we think Mr. Emerson entertains almost too great a contempt for learning. He who is acquainted with the history and manners of all nations, would never have acquired his knowledge had he not been in a great degree actuated by genius in the prosecution of his studies. Had the facts which he had accumulated been mere barren matter of detail, never would he have had resolution to pursue so uninteresting a route. But he, out of his own stores, has imparted a loveliness to the classic region of research, and the rites of Egypt and the mythology of Greece have typified to him one aspect of the human mind, and illustrated the operation of spirit in past ages. Genius is no less essential to the reader than to the author. Perhaps, however, it is to a greater extent manifested in the latter.

We cannot conclude these remarks without lamenting that Mr. Alcott has met with some persecution in consequence of the sentiments which he has expressed. We are not surprised. To make moral excellence essential to the worthy revelations of genius—to tolerate, as a poet, no interesting *roué*, or romantic profligate, but to require purity of character as the only title to that august appellation—to exclude from mind's chivalry all who are not honourable or valiant—is a course which must necessarily be opposed by the masses whom such a prohibition affects. Dare we then express for Mr. Alcott, personally, either pity or regret? The more faithful he is, the less need has he of our sympathy or applause. Human praise is only worthy when it re-expresses divine approbation. Let the devout worshipper ascend the holy mountain, and there sacrifice to the gods. The propitious thunder shall greet his attentive ear. It matters little whether the vales below reverberate the sound.

RAILROADS and steam-engines are the order of the day : so much so that of late there has been quite a glut of publications, theoretical and practical, bearing upon those subjects. Accordingly, not only is Civil Engineering 'looking up' and reinforcing its corps daily, but those who make a profession of it, or out of it—as the case may be,—are looking up too, and at the same time begin some of them to look down upon architecture as something comparatively trivial, and requiring less mental powers. We are not going to question the importance of civil engineering as regards national industry, or the prosperity of a country : nay, without debating that point at all, we will allow that it is (so far) of greater and more obvious intrinsic value to the community ; and also that by creating and diffusing wealth it may indirectly tend to promote every branch of civilisation, and the fine arts themselves among the rest. All that we contend for is, that such studies are altogether distinct from art, and belong to an entirely different sphere.

Fully agreeing with the doctrine enunciated humorously, yet perhaps very seriously intended, by Anthus, the entertaining author of *Esskunst*, we hold that though it may in the first instance emanate from necessity, art invariably manifests itself in the superfluous, or, we might term it, the *super-necessary* ;—between which epithet and 'unnecessary' there is assuredly considerable difference. Practical science and art may therefore be said to stand in the same mutual relation as prose and poetry—the opposite poles of the positive and the imaginative. The analogy will appear strengthened when we observe that, contrary to what would seem the natural progress from the necessary to the super-necessary, poetry is generally the first form in which the intellectual development of a people displays itself ; and so also art is, if not the very first, one of the first phases of

civilisation ; in advancing beyond which, the imaginative is abandoned as something superfluous and extravagant, and art, instead of being cultivated for its own sake, is chiefly valued as administering ornamentally to what is directly useful.

Whether it be matter for regret or not, we cannot help fancying that society has advanced—or retrograded—to that stage of civilisation when, sobered down by experience, it resigns the workings of imagination as mere dreams and chimeras, and betakes itself to the positive and practical. The Middle Ages employed—perhaps wasted—their energies upon rearing cathedrals and other piles exhibiting all the prodigality of art ; the nineteenth century, infinitely more rational, is devoted to railroads, and canals, bridges and tunnels ; while art must be content with the crumbs that fall from the table of utility. Such at least is pretty nearly the state of things among ourselves : nor is it at all unnatural, because when all the elements of society in this country are decidedly prosaic, and calculation prevails in everything, it can hardly be otherwise. Not only has the bulk of the public no sympathy with art, but the small section of it which has, is too lukewarm or indolent to exert itself effectively ; added to which art numbers very few generous and devoted adherents among its own followers. The spirit of trade—which then becomes base, unworthy, and degrading—influences more or less, it is to be feared, every one of the fine arts in this country, and architecture full as much as, if not more than, the rest. As an art, this latter has been reduced almost to a system of copying ; and it has in consequence become a convenient refuge for numbers who enter upon it merely as a lucrative profession where practical cleverness and activity, and in fact any talent but for business-like plodding, may very well be dispensed with. No wonder therefore if we so frequently find all the feelings of the artist merged in those of the trader ; or so much mean personal rivalry indulged in, almost to the exclusion of all generous emulation. No wonder the public hear so many complaints of manœuvring, intriguing, and jobbing, through which works of importance have been confided to men of inferior talent, and the best opportunities comparatively thrown away. Unless, indeed, to such mismanagement, coupled with the supineness both of the profession and the public, to what must we ascribe the disadvantageous contrast exhibited by so many of our architectural undertakings in comparison with similar labours in several continental states, whose resources are so greatly inferior to our own ? It cannot be alleged that opportunities of the kind

are much more rare in this country than in any other;—or, if so, the greater care should be taken to turn them to the utmost account:—nevertheless it is indisputable that in general our public edifices are neither commensurate with the character of such a metropolis as London, nor will bear a comparison even with some which adorn several minor capitals abroad.

We should be open to reprehension were we to disguise the truth; and by over-estimating our own achievements in art, lead persons at home to suppose that we need not endeavour to surpass what we have already produced. If then we express an opinion the reverse of flattering to our national pride, it is certainly not with the view of discouraging, or of creating useless dissatisfaction, but of stimulating to greater energy for the future. Instead of attempting to console ourselves for failures, by depreciating what has been done in other countries, the wiser and more ingenuous course would be to profit by those failures and the example of others, and to exert ourselves more vigorously than ever. Architecture should be rescued from those trammels and fatal influences which have checked and stunted it at home. We do not say it is from inferiority of talent that we are unable to compete with other countries in the character of our public monuments; but if such be not the case—if with at least equal talent, and far superior means, most of our recent public works fall very short of contemporary labours abroad: there is all the more reason for suspecting that it is owing to a very defective or very pernicious system, to unpardonable want of energy in those who possess talent, or most culpable negligence, incompetency, or abuse of power on the part of those who have control over such works. In short it becomes but too evident that there must be 'a screw loose' somewhere.

It is useless attempting to disguise that such is the real state of things in this country as regards architecture. We might possibly delude ourselves into the idea that our buildings eclipse their foreign rivals; but we cannot impose upon foreigners, who, when they come over to this country, will indulge in comparisons not altogether to our advantage. Those who stay at home may remain ignorant of the insignificant general character of many of our recent churches and other public structures, but then they may also ask how it happens, if we have achieved of late any really magnificent architectural undertakings, that the merits of such are not made generally known by means of published designs. Even *Förster's Bauzeitung*, which professes to describe the chief architectural

monuments not of Germany alone, but all Europe, and which has given designs illustrating Canova's Church at Possagno, the Arco delle Pace at Milan, the Arc de l'Etoile at Paris, the Alexander column at Petersburg, and several other works of that class, has not since its commencement furnished a single example of the kind from this country, although it evidently pays great attention to what is going on here, and has from time to time described very minutely our principal railroads and similar works. The only public building of this country introduced therein is Hungerford Market; which although an edifice of considerable extent, and worth notice for some constructive details, is by no means a particularly favourable specimen of architectural design. Whether this neglect of English architectural productions is accidental or intentional, it is not calculated to extend our reputation abroad, or impress foreigners with the idea that any of our recent buildings can fairly compete with their own. Neither are we ourselves at all solicitous to vindicate the character of our own school, by affording to the architects of other countries the means of comparing and studying any of our most successful buildings. Scarcely one of our living architects has cared to publish his designs;*—that is to say, of buildings actually executed by him, though several have published collections of designs for villas, cottages, and things of that stamp,—saleable commodities, and, for the most part, manufactured like Peter Pindar's razors, merely to sell.

To say this is astonishing would be contrary to our real opinion, since it is so easily explained that scarcely anybody can be at a loss to account for it; but then what does the fact itself declare? why first, that the demand for architectural publications similar to those of Schinkel, Klenze, Moller, Ottmer, and others, is so exceedingly small as to amount to a prohibition of them where a fair remunerating profit must be looked to; and next, that none of those who have made money by their profession care to expend it in publishing examples of their best works, at

* Only two exceptions occur to us; the first is Mr. Laing, the original architect of the Custom-House, the other, Mr. Foulstone, of Plymouth; but unfortunately neither the publication of the one nor of the other is calculated to convey a favourable opinion of English taste, either as regards the subjects of their plates or the style in which they are engraved. Mr. Foulstone's Greek architecture is deplorably insipid; dull, mechanical copies of Doric or Ionic columns, without a single touch of originality or genial feeling in any one of the buildings. The best that can be said of them is, that they are a degree less miserably bald than those of Laing.

the hazard of pecuniary loss by so doing. As a matter of prudence this may pass without reproach, and it is therefore hoped that no one will take the mention as such. But it certainly does not indicate anything either of that liberal feeling, generous ambition, or ardent attachment to professional studies which ought to characterize the architect, supposing him to be an artist in the true meaning of the word. On the other hand, an architectural work that is not strictly practical, meets with very little encouragement from professional men, while one that is not in some degree a picture-book also, meets with as little from any other class of purchasers. The consequence is that scarcely any thing whatever of a purely architectural character is now brought out in this country, and the few who have any taste for works of that class are obliged to supply themselves from the continent. Perhaps we should not be exceedingly wide of the mark, were we to say that for some of the reputation they have obtained, the publications of Schinkel and others are indebted to their having no English rivals, no competitors from this country to participate with them the attention or admiration of the European public. This is the more mortifying as the time was when England had a high character upon the continent for many splendid architectural publications, and which earned for her a wide celebrity in that branch of art. At present the case is reversed. English libraries may enrich their architectural stores by the addition of foreign works; but foreigners are not likely to be overstocked with similar volumes now from us.

Not only has this branch of publication so fallen off among ourselves of late years as to be almost dwindled away altogether; but—what is not the least extraordinary part of the matter,—the decline seems to have been in no degree retarded by the establishment of the Royal Institute of British Architects; though it might have been imagined that the formation of such a society would have almost immediately given a fresh impetus to the study of architecture, and by this time at least have revived a taste for it, and diffused it more and more widely. Such, however, neither is, nor is likely to be the case. Whatever influence for good the Institute may possess, it seems to take care that it shall not extend beyond its own walls. We have been unable to learn that it has reformed a single professional abuse, or made an exertion towards doing so, except one very faint effort to correct some of the most crying sins of the present notoriously bad system of competition, on which subject a Report was drawn up; but deterred from

further proceedings by the difficulties and objections started, the advocates for reform showed their faint-heartedness, and suffered the whole matter to fall to the ground at once. One thing which we did expect rather confidently was, that the Institute would at all events establish an annual exhibition of architecture—both models and drawings—on a suitable scale; if from no other motive than to rescue their art from the step-dame clutches of the Royal Academy, and to prove to the public that it has claims of its own upon their notice; but we fear we gave them credit for more zeal and spirit than they possess. We have, indeed, been assured that the Institute have done and continue to do all that is in their power,—that means, not will, is wanting. It may be so: but as that *all* seems just tantamount to nothing, the natural conclusion is that the Institute is altogether powerless for good, and that there is not the remotest chance of its tending in any degree to promote or benefit the art for whose sake it was established.

Could we even discern an increased spirit of emulation, more application, more diligent study, and the endeavour to gain over public attention to architectural subjects and drawings, it would be something: instead of this, there has been a visible falling off in the architectural part of the Royal Academy's exhibitions for the last two or three seasons. Directly, indeed, this circumstance does not say much against the members of the Institute or those who stand highest in the profession, because very few of them ever exhibit at all; but then indirectly it says a great deal, since it affords a tolerably plain proof of their apathy, and how unwilling they are to incur any trouble or expense for the purpose either of vindicating the character of their art, or affording instruction to others. In short it looks as if there existed a far greater desire to confer a cheap kind of importance on the profession, than to advance the art itself, or make the least personal exertion or personal sacrifice to that end.

Very sorry should we be to involve all indiscriminately in such censure; yet taking the members of the profession generally, they certainly do not pursue it with any of that high and generous feeling which ought to animate the followers of art;—some of them show no motives but those of traders, and therefore a spirit more ignoble than these, whose dealings neither require nor admit of the *con-amore* principle that ought to actuate the others. To many it is an inexplicable mystery that modern art generally, with all aids and appliances, lacks

the energy and generous quality which stamped it in former ages. Artists endeavour to account for this by throwing the blame upon the public, and its want of a proper sympathy for art. This doubtless may be one among other concomitant causes; but the chief, we should say—and one as baleful as all the rest put together, lies with artists themselves; being nothing more nor less than want of that enthusiasm, that earnest devotedness to art for its own sake, without which nothing really great can be accomplished. Without enthusiasm talent will seldom amount to more than cleverness, which for a while may satisfy, and earn for its possessor a short-lived reputation more or less brilliant: but it is by no means of the vivifying influence of enthusiasm that talent becomes genius. Take away that ennobling principle, exclude the higher motives, the loftier impulses proceeding from it, and art, even when successfully pursued, becomes a splendid, honourable drudgery; perverted from an end to mere means. Undoubtedly there still remains behind a potent stimulus, and one in the opinion of the world quite sufficient to urge on to any achievement, however arduous, seeing that it is the main-spring of human actions and human energies. Nevertheless we hold it to be a fatal error—one pregnant with mischiefs, puzzling to account for, to imagine that such stimulus will suffice in art. The enthusiasm of money-getting stands in direct opposition to that other kind of enthusiasm, which is so greatly wanted, while of this there is far too much. Where ordinary self-interest becomes the motive inducing a man to attach himself to art, art becomes to him little more than a task-master, and will be beloved accordingly just in proportion to the wages obtained. In what degree these remarks apply to architects, quite as much as, if not more than to any other class of artists, we shall leave the reader to judge.

Although those who follow it professionally are by no means backward in hinting, whenever opportunity offers, that architecture is not properly encouraged—and so far they are right, because for patronage to be really beneficial to art, it must be accompanied by discernment and taste;—Do they themselves encourage, or in any way promote or advocate that acquaintance with the art,—that study of it on the part of others without which there can not exist any real taste or discernment, or any proper sympathy with it in the public? Do they endeavour to facilitate such study, either directly or indirectly? We may say at once that they certainly do not, but on the contrary too evidently set their faces against every

attempt that way tending. Persons like ourselves might naturally opine that architects would gladly promote every scheme aiming to popularize the study of their art, and to invest it with interest for the many; simply because it is for their own interest that the many should appreciate it and enjoy it, and, relishing it as intelligent, encourage it intelligently in turn. No such thing: if, indeed, sympathy could be kept within the bounds of stupid wonder, or criticism never extend beyond compliments and harmless twaddle, there would be no very great danger: but to teach people to think for themselves, and form opinions of their own; to enable them to discriminate between the plagiarist and the man of original ideas,—between the servile copyist, and the studious artist;—this would be highly imprudent and dangerous. Criticism, especially criticism based upon reasoning and argument, and which supports itself by something more than vague allegations, is, as much as possible, to be discountenanced, whether a positive check can be put to it or not. Of such criticism the majority of the profession appear to have an instinctive dread, and not without reason; as few of their works will abide its scrutiny. Some, if not the majority, consider it quite a presumption on the part of any writer not belonging to the profession, to form—or at least express any opinion. He is told that he ought to confine his opinions to his own private circle; which might just as well be said to every one who takes up his pen to communicate his ideas on any other subject. At the present day, however, most persons fancy that errors and prejudices are more likely to be exposed, and truth elicited, by promoting discussion than by stifling it. If error be propagated by one writer, let it be exposed by others. But architects, it would seem, adopt a most ungracious dog-in-the-manger principle, for they neither care to instruct the public themselves, nor that any one else should assume that office for them.

It is hardly to be supposed that such feelings and sentiments are openly expressed by the members of the profession, even among themselves: this would be too daring an avowal. Yet that such feelings are really entertained may without difficulty be gathered from a variety of circumstances, which, though when taken singly they appear inconsiderable, when put together furnish strong and conclusive evidence as to the real state of the case.

Should we, however, have been labouring under an hallucination of mind in respect to what we have just declared, we should feel happy to be undeceived, and to learn that,

let appearances be what they may, the profession are not only well disposed but even eager to promote whatever is calculated to bring architecture forward and remove the prejudices now existing against it, by showing its value merely as a liberal study and occupation of taste; and for which if it be not calculated, it unjustly usurps the title of a fine art.

Great is the honour claimed for architecture as an art,—and some have gone so far as to assert for it a right of precedency over the rest. As soon as we attempt to approach it as such, to inquire into its character and powers, to make ourselves acquainted with its peculiar language, its rules and idiom, we are either driven back as profane intruders rashly seeking to penetrate into mysteries reserved for the initiated, or are told that practical knowledge is everything: in other words, that architecture after all is not so much a fine as a mechanical art, and that much of the practice consists merely of routine and details, which have no more to do with art than has the engrossing of a deed. Such view of it is somewhat modest—not to call it an utter abandonment of the high pretensions claimed for architecture as a fine art. In this latter quality, setting aside all the rest, we presume it will not be denied that it still retains enough to entitle it to something more than a brevet rank, as one of the fine arts *by courtesy* only. Either it has the powers and attributes of a fine art, or it has not: in the former case it appeals to the sensibilities and sympathies of all, and is capable of being studied and understood accordingly, whether its mechanical and scientific operations be comprehended or otherwise. In the second case, the sooner the world is undeceived, by being told that it is exceedingly limited in its æsthetic capacity; that however important as a science and indispensable as a useful art, it has but little of either the powers or the qualities of a fine one,—the sooner this is said the better: a great deal of misconception and of consequent misunderstanding would be prevented; and by abandoning all pretensions to the name of artists, architects would at once escape the responsibility attached to such title, and the reproach of doing nothing to justify it.

When it aspires to be something more than mere building (which proposes to itself nothing beyond utility, security, and strength,)—science, knowledge, and skill become merely the auxiliary means of which architecture avails itself for some higher end,—means indispensable as such, but otherwise unimportant, and of no more account with regard to the æsthetic value of

the production accomplished through them, than the mould or the process of casting to the bronze statue so formed.

We have then a right to demand something infinitely more than the mere satisfactory. Science becomes as nothing if there be not also refined taste: it is of no avail to say that all the conditions of constructive skill, durability, convenience, economy, are fulfilled, if there be not also beauty; or that the architect has performed his task to perfection as a builder, if he has shown no power, no imagination as an artist, and his work be destitute of æsthetic charm. Architects are rather in the habit of throwing dust into the eyes; neither are they themselves particularly clear-sighted, but rather in the unfortunate condition of not being able to see the wood for the trees. The material—the matter and its forms, merely as such, are to them every thing; the æsthetic, the ideal,—the forms as expressions of beauty, as nothing. They regard the latter much as an anatomist may contemplate a beautiful human figure, as a system of bones and muscles. So far his professional knowledge seems rather to blunt the sensibility of the architect than to render it more acute, unless such unfortunate tendency be carefully guarded against by cherishing opposite feelings, and by cultivating the poetry of the art.

Perhaps we dwell upon this ungrateful topic rather too long; yet what we have said may be so far productive of good as to induce the question whether architecture as now generally practised be not greatly overvalued. This question, together with an apprehension of its consequences, might possibly rouse up the profession more effectually than anything else can do.

Turning our eyes to other countries, we must say that, as far as appearances go, architecture is pursued in a far better and more liberal spirit abroad than at home. One favourable symptom is, that infinitely greater encouragement is there given to architectural publications; which not only find a readier sale, but command greater attention. Instead of being for the most part passed over in silence or else impatiently dismissed in a few common-place paragraphs which chiefly show that the reviewer is at a loss what opinion to express, works of this class are often carefully reviewed. Nay, we have occasionally met with far more satisfactory notices of English publications of the kind in foreign journals, than in any of our own;—such for instance as Murphy's *Arabian Antiquities of Spain*, a work that for any signs of its existence occurring in reviews may be said to have

dropped dead from the press, while so many ephemeral works — long ago completely forgotten, have been ushered into the world with the most magnificent trumpetings. To take a more recent example, Jones's *Alhambra* has fared no better than Murphy's *Antiquities*. It must be confessed, indeed, that both are works rather of curiosity and luxury, than practical utility; still they deserve attention from criticism, and are such as every architect ought to possess. If therefore, with the ability to purchase, a professional man abstains from so doing, he must not feel surprised at being considered—not actually sordid perhaps, but guiltless of any excess of enthusiasm. Again, while Hope's *History of Architecture*, and other works of that kind have been translated into either French or German, if not both, very rarely indeed is such compliment returned by our translating anything similar from other languages. We do not speak of works whose chief interest lies in their engravings, and are not to be reproduced without very great expense, but of those which consist nearly, if not altogether, of letter-press, and would therefore be additions to the stock of our architectural literature. We need only mention the names of Stieglitz, Busching, Hundeshagen, Hirt, Rumohr, and Racknitz; and if it be said that their writings are very well known here in the original to all whose studies lie in that direction, we must beg leave to doubt the fact strongly. Coupling therefore all this with what has been previously said in the earlier part of our article, no very flattering conclusion can be drawn from it as to the feeling with which architecture is pursued in this country, in comparison with others.

The results are accordingly: therefore, however much it is matter of regret, it ceases to be one of wonder that architecture itself is not in that flourishing condition among us which it otherwise might be; nor can the inferiority be attributed to want of encouragement, if by encouragement no more is to be understood than employment and emolument. But, has not opportunity after opportunity been frittered away? and do we not still adhere to the same mischievous system, in spite of so many lessons of dearly-purchased experience? Could the blame of these failures we are doomed repeatedly to witness, be thrown either upon the inadequacy of our means, or a rigorous spirit of economy, even this would be less humiliating to our national taste, though more mortifying to our national pride. Yet this poor consolation is denied us; for if there is a good deal of parsimony, there is also no lit-

tle prodigality:—in short, a kind of paltry peddling economy, owing to which we manage to pay quite as much for what is deficient as a work of art, as with judgment and taste would have done honour to the country. A paltry stinginess is often suffered to interfere and maim a design by clipping and paring it down in parts, as though it were unimportant whether completed according to the original intention or not, and anything might be omitted at random. If the design has been properly studied at first,—and if not, it ought not to be adopted,—such a process is manifestly absurd. If desirable to render it less expensive, the proper way is to modify the whole, so that every part shall still be in due keeping, and no inconsistency of character, no deficiency of any kind be perceptible.

That a better average taste is now established among us, than that at the close of the last and commencement of the present century, we do not deny; still it falls greatly short of what it might and would be had it been allowed to go on progressively increasing in stature and in strength. Owing to the great impulse which has been given to building, since the peace, we have now, throughout the country, a show of very respectable bits of architecture—things of rather ambiguous or negative merit;—Gothic made neat, Grecian made homely, Italian softened down to insipidity. In art our ambition is of a staid, modest, and reasonable kind. Among all our recent works we have few of monumental character, that is, such as testify honourably to the power and taste of the age in which they were produced:—scarcely anything that is really imposing in point of scale, and not less imposing and dignified in style. Our classical school is mechanically correct, frigid, and mannered; we must not look to it for geniality of conception, masterly originality, or happiness of invention. What beauties it gives us are almost altogether borrowed;—transcripts of good originals as regards individual features, which are, however, seldom more than merely put together, instead of being so combined as to produce an ensemble with one and the same spirit pervading every part, a kindred feeling diffusing itself throughout. Owing to an unfortunate littleness and feebleness of manner, buildings large in themselves do not make an impression at all proportionate to their size, but are reduced to the minimum of effect. For grandeur and majesty of aspect Buckingham Palace will hardly bear comparison with that lately erected at Brunswick; and which though by no means unexceptionable, proves Ottmer to be as superior to Nash,

as Brunswick is inferior to Great Britain. What the former looks like, or rather does not look like, we all know too well; but the other has a princely air that bespeaks the residence of a sovereign.

Contrasts of this kind are likely to pass for invidious, more especially when they happen to be unfavourable to ourselves; yet the best way of preventing such is by taking a salutary lesson from them for the future, and endeavouring to be first where we now stand almost last. If, however, only to show that we wish to be impartial, and do not blindly defer to the authority of names and reputations, we shall here bestow some notice on the Königsbau, or new palace at Munich, numerous plans and other engravings of which may be seen in the *Bauzeitung* for 1837. We need scarcely disavow any prejudice against Klenze, for we have been charged with being much too favourably disposed towards him; our comments, therefore, stand a chance of being received as free from bias either way.

The principal, or indeed, only façade, namely, that forming the north side of the Max-Josephs-Platz,* extends in a perfectly unbroken line for the length of 406 feet (English). It is 65 feet high, except in the centre, where the height is increased to 95 by the addition of another order, for the extent of eleven windows, or somewhat more than half the length of the front; there being twenty-one windows or apertures in each of the other stories. So far there are the elements of grandeur—length, continuity, loftiness; and when we add to these, massiveness, both with regard to the relative proportion of solid and void, and that arising from the character of the style employed, namely, the older Florentine, it will be taken for granted that it is not at all deficient in greatness of character and the qualities allied to it. Nevertheless we are dissatisfied, less for what it is than for what it is not. Scarcely any pretension whatever is made to originality; the whole is too direct and close an imitation of the Palazzo Pitti; the character also is palpably bor-

rowed and assumed, with this additional drawback of being altogether exotic, and not at all in unison with anything else. As a monument, the original is a highly interesting and impressive work of architecture; as a study, most valuable; as a model, most unfit,—that is, for a palace in the nineteenth century. Recourse might have been had to the same style, but it ought, we conceive, to have been differently treated,—in many respects considerably modified; and required a livelier and more captivating expression imparted to it. Instead of this, the physiognomy given to the edifice is by far too repulsive and stern: simplicity has been carried to severity, uniformity pushed to monotony, and to the exclusion of play or contrast of any kind. Moreover, its close general resemblance to the Palazzo Pitti is apt to provoke a disadvantageous comparison, because after all it falls considerably short of that edifice in its mass; at the same time that it is deficient in the powerful contrast produced in the other by the greater solidity there of the lower part. We do not approve of architectural duplicates, more especially when an opportunity offers for a masterly and original production. Such opportunities are far too precious to be negligently thrown away, and ought to be turned to account by creating something that shall carry art onward, and, if possible, give it a new and invigorating impulse.

These objections are no way diminished when we discover that instead of the façade preparing us for the interior, it is quite in opposition to it; the decorations throughout the latter, both architectural and pictorial, being scrupulously, not to say affectedly, Grecian, both in style and character. By Wiegmann, Klenze has been reproached with inconsistency for having in the Glyptotheca employed vaulted ceilings and other forms of Roman architecture within a building externally professing to be purely Grecian:—this, we must say, savours rather of hypercriticism. But in the case before us there is a positive clashing of opposites, because though the apartments are in every other respect perfectly Greek in style and taste, their circular-headed windows contradict it, and disagreeably remind the spectator of the still more decided difference between the taste of the exterior and that of the interior. This, however, is a trivial blemish compared with one very serious and pervading defect; namely, that of the plan altogether, which so far from presenting any kind of beauty, any originality, contrivance, variety, contrast, or play, is exceedingly commonplace and monotonous, and as inconvenient withal as can well be

* A *situations-plan* of the whole palace and the surrounding buildings, as also a table of the public edifices at Munich, with their respective dates and architects, may be found in the article MUNICH, in the Penny Cyclopaedia. The façade of the Bibliothek, and some of Gärtner's Buildings at Munich, are given in Count E. Raczyński's "Art Moderne;" as also a coloured plate of one of the splendid painted windows in Ohlmüller's Church of St. Maria Hilf. In regard to this building Raczyński says, "Cette église est, peut-être, la construction la plus importante qui a été faite de nos jours dans le genre gothique, et une de celles qui a le mieux réussi."

imagined. It is divided on each floor into two enfilades of rooms, all rectangular, either square or oblong, without any intermediate communication, except one part where there is a narrow passage for domestics. As far as arrangement goes, not the slightest attempt has been made at effect. Not only are the principal rooms nearly of the same form, but nearly all of the same size, and so disposed as to occasion inconvenience, and exclude effect also. This will hardly be disputed when we say that the centre of the enfilade in the front of the building divides into a series of small rooms, having only a single window each; and being appropriated as the king's and queen's bed-rooms, dressing-rooms, &c., entirely cut off all communication between those on either side of them. Thus, so far from any climax being produced, all sort of focus and centralization is destroyed, and the parts are disunited and scattered. In fact the whole of this floor can be considered as consisting only of private apartments, notwithstanding that both on the king's and queen's side there is a throne-room preceded by two or three ante-chambers. With the exception of the rooms at either extremity of the front, all the others must be inaccessible to those whose immediate personal attendance on their majesties does not give them the privilege of passing and repassing as there may be occasion of doing.

As long as the apartments are or were merely in progress, and might be freely passed through by visitors, from one end of the building to the other, no inconvenience of the kind alluded to would be felt; and it was therefore most likely entirely overlooked by strangers, whose attention would be directed only to each room successively, without considering whether the whole was properly combined as a habitation. Either this pervading defect did not strike Mrs. Jameson, or she did not care even to hint at it; for in her long and somewhat particular account of the palace, there is not a syllable to lead any one to suspect that the plan is so egregiously faulty. If the dining-room is intended to be used only strictly *en famille*, no very great inconvenience may arise, though it cannot be reached from the queen's apartments otherwise than by passing through two open staircases and several very small rooms, some of them mere lobbies; neither can it be entered on the other side except through the king's throne-room, which is so far made to become a mere ante-room, or chamber of communication. The only rooms therefore which are at all fitted for the reception of general visitors at entertainments, are those above,

where the centre of the front is carried up a story higher than the rest. So far Klenze seems to have taken especial care that the classical compliment "*Quam bene non habitas*" shall be strictly applicable to his royal patron, Louis the First. In matters of this kind our superiority is so manifest, that foreign buildings of otherwise great pretension will not endure comparison with our own. For its plan, if for nothing else, Buckingham Palace may very safely challenge the *Königsbau* at Munich; not only as being free from the positive inconveniences of every kind found in the latter, but also as far better laid out for effect, as regards both facility of communication and spaciousness.*

We will not be quite sure that fresco-painting, when employed to the extent which it is throughout the Munich palace, is altogether the very best mode of decoration, or calculated to give the greatest importance to the architecture. For particular rooms and in certain situations, it may be suitable enough; but it is hardly so for sitting-rooms, where paintings upon such a scale are apt to become too obtrusive, and by their subjects forming too harsh a contrast—sometimes perhaps almost a ludicrous antithesis—to the familiar details of social life: the opposition becomes that of poetry to prose. A mere picture does not force itself so conspicuously upon the attention; it may be gazed at or not, studied or overlooked; but paintings which constitute, so to say, the local scenery of the whole space, put forth a too direct claim to notice; and though they may be interesting to the casual visitor, cease to make so much impression after constant familiarity. A great deal may certainly be said on both sides; we shall therefore only observe that as decorations for the walls of sitting-rooms, subjects in fresco ought, we conceive, to be employed with some reserve, and not suffered to occupy too great a space of surface. In this opinion we are borne out by one who must be admitted a competent authority on the subject, and who has not scrupled to

* Of Buckingham Palace plans, &c. are given in the new edition of the "Public Buildings of London." The height of the principal rooms is 25 feet, that of the picture gallery more; while in the palace at Munich the rooms are 27 feet high—which is certainly no very extraordinary difference. Nevertheless Mrs. Jameson would lead us to suppose either that the latter are much loftier, or the others much lower than they really are; for she says "George the Fourth had a predilection for low ceilings, so all the future inhabitants of the Pimlico Palace must endure suffocation." *Suffocation* indeed! if rooms twenty-five feet high are still so low as to endanger people's lives by suffocation, there would be scarcely half a dozen families in England that would escape it.

question the propriety of some of the most noted works of the kind. "The far-famed Loggie of the Vatican," says Hessemer, "which, ever since they first existed, have been extolled as the greatest models of decoration are in fact not decoration at all, but a series of paintings covering the surface of both walls and ceilings. As a whole they possess no architectural character; and if the separate pictures, allegories, &c., have very little intimate connection with each other, they have, as such, still less with their situation and with the building itself. As offering an instance of the greatest contradiction between locality and decoration, may be mentioned the works of Giulio Romano in the *Palazzo del Te* at Mantua, with regard to the pictorial but *non-decorative* merits of which I forbear to make any further comments."

After our animadversions upon the Königsbau, we can hardly be charged with being indiscriminate partisans of the "Bavarian Ictinus;" nor is it without concern we are compelled to admit that the talents of Klenze have not always been exerted in proportion to the opportunities afforded, or in correspondence with the generous ardour of his royal patron.* For the faults we have pointed out

* It has been said that we have overrated foreign talent in architecture, and shown a disposition if not actually to decry—to throw that of our own countrymen as much as possible into the shade. We have invariably spoken our sentiments honestly to the best of our judgment, without other bias or partiality than that arising from our love of the art itself, nor is it our fault if we have met with more talent in the works of some German architects than in those of the English. At all events we are but petty sinners in comparison with such a flagitious offender as Mr. Bartholomew, who in his work entitled "Specifications," not content with representing architecture to be now almost in the very lowest state of degradation in this country, both as to science and design, has favoured us with a chapter On the Present School of German, which we shall take the liberty of here transcribing entire.

"The present German school of architecture is, taken altogether, entitled to very considerable praise; its works possess much grandeur of conception, much beauty of sculptural decoration in the *very finest style of art*, blended with considerable constructive science. We have in none of our modern architecture *such exquisitely imaginative beauties*. Most of our modern buildings are *mean and bald*; some few of them possess correctness, but even of these some appear colder still than the stone of which they are built. In some points, however, our buildings are very superior to those of the Germans, for amidst the excellences of our foreign competitors' works, there is a rudeness which is totally surprising; a certain blending of the very worst principles of the very worst Gothic, at total variance with the soaring beauties of their school, which rises, in some respects, *beyond the works of the very Greeks themselves*. Without this dash of Tedesco corruption, their works would be too soaring, too *etherial to be human*. Their designs

we are not indebted to his opponent, Wiegmann: since he bestows no notice on any of Klenze's buildings, except merely *en passant*, with brief and general censure, and without entering at all into particular criticism. So far his pamphlet has disappointed us, for though the title makes no specific promise, we did expect that, whether for eulogy or the reverse, it would furnish—if not a biography, yet something like an account of the architect's professional career. Instead of this, the writer confines himself almost entirely to the consideration of Klenze's principles and theory, as illustrated in his collection of designs for churches, entitled "Christliche Bauart." Of that production we cannot trust ourselves to speak, not having the volume by us to refer to, nor now recollecting more of it—after a single inspection—than that we considered the designs of rather mediocre quality, and betraying a want of study. The specimens there given of Greek architecture as applied to that class of buildings appeared to us by no means happy models, nor calculated to instruct, as they might have done, had the motives of each subject been explained. As little are we able to say whether the severity of Wiegmann's remarks—his fastidiousness and captiousness are justified by anything he himself has done, or by greater success attending his own principles; to confess the truth, it is not very clear to us what the latter really are, or what at times he means to say. We may, however, venture to assert that several of his remarks come home to others besides Klenze, and who, equally bigotted in favour of Greek architecture, are still more cold and pedantic in their application of it; formal copyists, who do not even attempt more than a mere reflection of the antique, and that only in particular features; and while certain forms are scrupulously imitated, fidelity as to the genius and real spirit of the style affected is usually lost—perhaps held matter of no account. The consequence is that the things so produced are more or less failures—neither antique nor modern—not a skilful adaptation of both, but a harsh and disagreeable conflict of opposing elements and contradictory ideas. Little does it avail for an architect to exhibit

seem to be the result of the two opposite principles resident in men. Could we transfuse into our architecture the unpolluted, classical, and inventive beauties of the Germans, we should both warm and raise it. But we need only to copy the vices of the German school to complete the ruin of our own *diseased architecture*."

This extract shows that there is at least one English writer—and he himself an architect—who far out-Herods us in his estimate of the German school.

the most perfect Grecian portico or colonnade, if he at the same time lets us see that he has trusted to that alone;—that so far from being a necessary portion of his structure, it is a mere adjunct which, though certainly not so intended, chiefly forces us to feel its own vast superiority over all the rest; and the difficulty, if not impossibility, of making that which ought to be principal, harmonize with, or even seem worthy of what is engrafted upon it. Almost invariably do architects forget that by such adoptions they tacitly bind themselves to raise every other part in the same spirit, and to display such powers as shall excuse their appropriating the merit of others to themselves, by making it truly part and parcel of their own work.

Unless this last can be effected with ability, the antique forms will seldom be more than something hung about a modern building—extraneous parts;—not a consistent dress in which the whole is attired, but mere trimmings and appendages; intended to pass for architectural style, but oftener making it all the more manifest how deficient the building itself is in character, and destitute of all that conduces to style. Nay, if, on the one hand, columns and other Greek decorations display the great superiority of classical taste, on the other, they lose much of their original value and charm, by being associated with what but ill accords with them. Many a modern *soi-disant* Greek building reminds us of Cicero's witty question to Lentulus: "Who has tied you to that great sword?"—for with us the question might frequently be: Who has tied that plain and insignificant building to that classical portico?—It also generally happens that such feature is itself impoverished, in order that the contrast between it and the rest may not be too ridiculously glaring.

"Exquisite as is the taste," says a recent writer,* "which characterizes Grecian design, the forms to which it was applied are by far too few to meet the numerous and complex exigencies of the art at the present day; besides which, simple as the application of the style appears to be, and certainly is, if nothing more be required than to apply its mouldings and transfer its ornaments to buildings quite differently constituted, it is by no means an easy task, as experience must have convinced many ere now, to employ it successfully, and so as not merely to avoid glaring inconsistencies, but so as to produce a work that shall be of high and uniform

quality throughout. To accomplish this is a very different matter from producing a decent plagiarious compilation; for in addition to a well cultivated taste, it demands no small portion of inventive power: to say the truth, it requires nothing less than that the architect should be able to conceive his subject in the spirit of an artist of antiquity, and afterwards mature and finish it up, furnishing to it from his own mind all that is necessary for its completeness, but of which ancient examples stop short. Those, therefore, who are desirous that Greek architecture should retain its vogue among us, should aim at accomplishing this; if they cannot—if, after so long a trial of it, it be found utterly incapable of giving us any thing much better or more consistent than has hitherto been produced, and that we have already exhausted its powers of design and the combinations it admits of, they have no very great reason to be surprised should it now be laid aside for a style (*viz.* the Italian) which not only readily adapts itself to our mode of building, but derives much of its character and effect from features for which ancient architecture makes no provision, or rather obstinately rejects."

These remarks certainly deserve attention, because they are particularly directed against the besetting sin of almost all our modern Greek—not to call it pseudo-Greek architecture. It is quite objectionable enough that even at the best, the façade of a building, instead of resulting naturally from its internal distribution and circumstances of construction, is little better than a mask artfully adapted; but it becomes actually offensive and unpardonable when that mask itself is allowed to exhibit contradictions and dissonances which betray how ill the style professed to be adopted is even understood. If the simulation cannot be consistently kept up—if what is Greek and what is not Greek is so obstinate that neither can be accommodated to the other, it is better to avoid altogether the appearance of a direct imitation of the former style, and only to borrow so much from it as can be properly incorporated with the rest.*

* Were architectural composition at all taught as it ought to be in academies of art, the errors we daily witness would never be committed: yet though that branch of the study is almost the only one which properly belongs to such institutions, it is precisely that which is most neglected. Indeed, it is hardly affected or attempted to be taught at all, but left entirely to accident. When prize subjects are undertaken by the students, it is not sufficient to award premiums to the best; the merits and defects of all these ought to be made the subject of a lecture or lectures by the architectural professor, and with the drawings before him, in order to be

* See "*Studies and Examples of the Modern School of English Architecture*," p. 17.

Diametrically opposed to Klenze, who considers Grecian or Greco-Roman architecture—for he does not reject the Roman arch—to be the only style adapted for universal application, Wiegmann contends that the adherence, or the attempt to adhere, to pure Greek forms in our present and totally different system of construction, is no better than pedantic affectation; and that they ought no longer to be retained by us as models. He further asserts that there can be no such thing as a permanent and unchangeable style in architecture, and that the endeavour to revive at the present day any by-gone style whatever is an absurdity, and very much like trying to force a stream to flow back to its source. According to him, only that which is perfect matter of indifference in itself, and has nothing to do with style, can be indiscriminately adopted as suitable to all times and all occasions. In this there is a certain degree of truth, but somewhat of perverseness also; for a style based upon Greek architecture must upon the whole be allowed to run more in unison with modern taste generally, and prove more capable of application to every diversity of purpose, than any other we are acquainted with. At all events Wiegmann himself has not even attempted to point out how we are to extricate ourselves from the perplexities of his doctrine. He is not one of those who would discard Grecian in order to make way for Gothic, because he rejects the one just as much as the other. Neither do we exactly know how far he really objects to the Greek style, or under what limitations he considers its adoption allowable or even beneficial. That he admits the latter to be possible, is, however, apparent from the commendations he bestows upon Schinkel, observing:

"He is an inspired venerator of Grecian art: but instead of adhering to its externals alone—to what was more or less conventional in it, and arose out of the circumstances of the times in which it flourished—he has actually penetrated into its very spirit, and in more than one of his works has shown that the rationality and beauty arising out of construction—which stamps the works of the Greeks as superior to all others, may be made to display themselves even at the present day; and that notwithstanding the great

difference between them and the structures of antiquity in regard to many particulars of design, such works partake infinitely more of the same spirit than do the ill-understood and lifeless imitations of which Klenze has furnished us so many," viz. in his *Christliche Baukunst*.

How the above passage can be very well reconciled with the apparently unqualified rejection of Greek architecture even as a type for us moderns, is a point we must leave to Herr Wiegmann himself to explain. In admitting that it is possible to catch the true spirit and genius of Grecian architecture, and to infuse them into buildings adapted to widely different purposes from those of antiquity, he admits all that we ourselves contend for; and, in fact, so far advocates the very course we ourselves would uphold;—since few can be more strongly opposed than ourselves to that cold, formal, lifeless imitation of Greek models, which amounts to nothing more than the most servile and tasteless species of copying—slavishly correct as to certain particulars, but egregiously incorrect—absolutely licentious, in all that regards taste and feeling. We certainly should have been far better satisfied had Wiegmann explained himself so fully as to remove all apparent contradictions, and to leave no room whatever for doubt; still more, had he confined himself more strictly to architecture, instead of entering into vague metaphysical inquiries with regard to the nature and power of art generally, while he is so brief and obscure in regard to many points connected with the former, and which it is highly desirable that either he or some one else should render perfectly clear. What he chiefly proves is, not that Grecian architecture is altogether inapplicable at the present day—such doctrine being wholly at variance with the very high commendation bestowed upon Schinkel for the happiness with which he has in many instances made use of it;—but that the designs in the *Christliche Baukunst* are nearly all more or less defective, notwithstanding that they were put forth as models for the instruction of others, nor was their author at all fettered in his ideas by any of those circumstances which generally interfere in the case of actual buildings. After all, therefore, the more important question is left poised in equilibrium, as much being conceded on one hand as is denied on the other. Very little notice, again, is bestowed on the buildings actually erected by Klenze, notwithstanding that many of them—not only the *Pinacotheca* and *Neue Residenz*, but *Prince Maximilian's Palace*,* *Kriegsministe-*

distinctly pointed out and dwelt upon;—their faults or beauties as to general conception, their merits or their failings as to the treatment of particular parts, should be explained and commented on. Such direct lessons would, we conceive, be infinitely more instructive and impressive, than those which merely lay down general principles; because they would come at once to the application of principles, and furnish an opportunity of showing how far they were understood.

* In its plan this palace is many degrees superior to the *Königsbau*, yet still falls as many degrees

rium, Post Office, &c., are almost entirely in the Italian, and particularly in the Florentine style; yet whether the Munich architect's practice is on that account to be considered much more sound than his theory, we are not explicitly told, but left to guess it as well as we can. Now this indistinctness and indecision are to us highly disagreeable: if Wiegmann thought he could even demolish Klenze altogether, and give the death-blow to his theory in recommendation of Greek architecture, he should have shown himself more in earnest; and instead of saying a very great deal that amounts to nothing, should have stuck to the main point, and there battered away. If he wishes to have it understood that Klenze is little better than a charlatan in art, he should have put, or tried to put the fact beyond doubt—should have left us no middle course, but have either compelled us to adopt, or called upon us to refute his arguments.

We are, indeed, favoured with opinions as to one or two of the structures erected by Klenze at Munich; yet mere opinions are very different from argument and criticism: they may be correct or erroneous, just or unjust, but, if received at all, must be taken entirely upon trust, at least by those who have either not the means, or else not the ability, of judging for themselves. Thus, Wiegmann dispatches the Königsbau very summarily, calling it a "verballhornten Pallast Pitti;" and again, condemns the Glyptotheca as an unhappy combination of a pure Greek temple with a prison-like mass of building. If it is the absence of windows that constitutes the prison-like character complained of, the same comparison may be extended not only to the temples, but almost all the other public edifices of the ancients that are remaining; while if some other circumstance produces this effect, it might not have been amiss to explain it to us. Is Wiegmann of opinion that the wings of the façade are too low for the portico?—that, instead of rising above the rest, the portico would have appeared more of a piece with it, if merely stuck on to the building, and made to jut out from it, the whole front being kept of the same height throughout? Or, does he think that some windows both within the portico and on each side of it would have improved the whole—have mitigated the too temple-like character of the one, and the too prison-like aspect of the other? This is what he does not care to inform us; neither does he afford the least clue as to what he

considers a more harmonious combination, by referring to something else as an example of it. The most, therefore, that we can say in his excuse is, that he is kept in countenance by a great many others who seem to think that the mere expression of praise or blame is sufficient for architectural criticism.

This last remark applies far more strongly than we could wish to the *Allgemeine Bauzeitung*,* where of the various buildings that have been represented and described, scarcely one has had any comments made upon it. Yet this suppression of criticism can hardly have been occasioned by overstrained delicacy, because several would have afforded opportunity for descanting upon the merits of their design. Among these are the Buchhändler Börse, at Leipsic, erected by Geutebrüch, the architect of the Augusteum, 1834-6; and Dr. Härtel's house in the same city, by Waldemar Herrmann, of Dresden. Both are in a rich Italian style; and of the two the latter has somewhat the superiority as to extent of façade, its front being 112 feet (English) in length, while that of the other is 108. Besides which it has very much the air of a public building, as there is only a principal floor with an open Corinthian loggia of five intercolumns, above the ground-floor or basement, while the loggia itself is decorated with compartments in fresco. As far as style and beauty of external architecture go, there is scarcely a private mansion in all London that can compete with it, certainly not one of recent date; for even Sutherland House is but a very plain and frigid piece of design in com-

* In some of the Numbers of this work, for the present year, there is an interesting series of papers on Gardens and Villas, by Freiherr von Welden, which is moreover remarkable on account of two very flagrant plagiarisms from English publications:—one a design copied from the second series of Goodwin's *Domestic Architecture*, which, though never executed, is pretended to be that of a house in the Isle of Anglesea; the other from a design for a villa by E. B. Lamb, in the third volume of the *Architectural Magazine*. In the plans of both are made some trifling alterations—they cannot be called improvements—but in every other respect the designs are the same, and so peculiar and striking, that once seen, they can hardly fail to be immediately recognized. As to Goodwin, he was not an overscrupulous person himself, as is evident from the exposure of his conduct with regard to that portion of his work of which the Freiherr has availed himself so very freely. As respects the other design, he does not pretend to say where it has been erected, but observes that it is considered here, in England, quite a pattern of its kind; and he therefore ought to have given its author's name;—for it is the suppression of the mention of the works whence the two designs are derived, that constitutes the worst part of the deception practised by the Freiherr.

short of excellence in point of its arrangement, in which there is neither contrivance nor effect, neither play nor variety.

parison; and both Norfolk House, in St. James's Square, and Buckingham House, Pall Mall, are absolutely homely. To say the truth, it may fairly challenge almost any one of our Clubhouses—at least of those already erected—for we must not, as yet, include the Reform Club, whose façade promises to eclipse all its neighbours. We call attention to this example all the more, because we have nothing similar at home: on the contrary, so far from any stimulus having been given of late years to architectural display in the town residences of our nobility and persons of fortune, it would rather seem that the trumpery show and flaring tawdriness of the Terraces in the Regent's Park, and other barrack-like ranges of buildings of that class, have brought the system into disrepute; and it certainly must be acknowledged that the plain and perfectly unassuming brick fronts of houses far more costly and spacious than those just alluded to, have a far more aristocratic look than the others, whose grandeur is nothing more than overgrown littleness, and meanness tricked out in the coarsest finery: truly may they be described as the very Brummagem of architecture.*

That other private town houses of a very superior character besides that of Dr. Härtel have been erected in Germany within the few last years, is shown by that belonging to Dr. Abendroth, of Hamburg, and forming one of the designs in Chateaufort's *Architectura Domestica*, where it is illustrated not only by plans and elevations, but by sections and plates of detail. Recent circumstances have rendered M. Chateaufort's name rather familiar to the English public, he having obtained the second premium in the competition for the Royal Exchange; and the taste he has displayed in the house just referred to, particularly in the staircase and some other parts of the interior, as well as in the arrangement of the rooms, and the variety of their forms, produces an agreeable though also a rather mortifying contrast to what we observe here at home. How he came to bring out his book in this country, we know not; but hope it will spirit up some of our own architects to revive the now obsolete fashion of publishing designs of buildings executed by themselves.

The last of the works placed at the head of our article deserves more notice than we can now bestow on it, although it claims notice here merely on account of a single pa-

per in it, namely that entitled *Ob' Arkhitectura*, and which certainly contains some very sensible and clever remarks well deserving the consideration of professional men. It must be confessed that the writer speaks more from feeling and from his own impressions than from his study of the art, and that he contemplates this exclusively from a poetical point of view; yet it is not on that account less deserving the attention of architects. On the contrary, it will be of service, we may hope, by dwelling in the forcible manner it does upon those qualities of design which architects themselves are apt to overlook—at least to consider comparatively unimportant and hardly worth the study necessary to secure them—namely, character and expression. "Has the spirit of architecture" (he asks) "entirely passed away in this our time, that notwithstanding the enormous sums expended upon many of them, so very few of our buildings have any pretension to rank as works of art, or exhibit proof of having been conceived in the genius, or even the taste of the styles professed to be followed?" Whether architects will be disposed to pardon the reproaches he brings against them on account of the warm enthusiasm for art which dictates these, we do not pretend to say: but he certainly does reproach them with showing themselves utterly insensible to the beauties of their own models. The art, he complains, has been reduced to little more than a trifling copying of little conventional niceties, while all fidelity as to character is, for the most part, wholly disregarded, and apparently held unworthy a moment's consideration. Scarcely ever can such a system produce any thing better than either feeble or else forced imitations of styles which are in themselves exploded, and have become to us as dead languages of the art. We do not, however, quite agree with Gogol in all his remarks: the following passage for instance is amusing at least if not instructive.

"Walter Scott was the *first* who swept away the dust from Gothic architecture and showed it to the world in all its beauty. From that time a taste for it has spread rapidly, and in England almost all the new churches are erected in that style. They are very charming (*miles*), very pleasing to the eye; but, alas! they have nothing of that true grandeur which breathes in the vast" (and he might have added, in the smallest) "edifices of former ages. Notwithstanding their pointed windows, their pinnacles and spires, they have upon the whole but very little of the genuine Gothic character, but evidently depart considerably from their models."

To the last of these observations we freely

* Were Mr. Hope to convert the range of dead wall in Duchess and Mansfield Streets, into an ornamental exterior of his galleries, not only the situation, but the nature of the building itself would be highly favourable to architectural display.

assent, but we think that the commendation bestowed upon our modern Gothic churches generally is by far too liberal; there being only a few exceptions among them of which it can be said that they are "very charming and very pleasing to the eye." Further on Gogol recommends Oriental architecture as a mine wherein many useful materials might be found, and from which many valuable hints and ideas might be derived,—much certainly, that might be ingrafted upon Gothic for domestic architecture, and particularly for interior embellishment,—that is, in the hands of an architect "gifted with the invention and the feeling of a poet." One remark of this writer which deserves especial consideration is, that while so much taste is displayed in the other ornamental arts, which, instead of being tethered to precedents, are freely allowed to exert novel combinations, all originality of detail is strictly interdicted in architecture, as nothing less than most mischievous innovation: yet surely full as much latitude might be allowed in the ornaments if not the proportions of a capital as we find in those of antique vases, which although all fashioned after one or two general types, exhibit an endless diversity in their details. It is true that not every one who calls himself an architect can be safely trusted to depart at all from established rules and models; but this perhaps is in a great measure owing to their having been trained from the very first to look upon it as their duty not to cultivate their invention and form their taste upon the best examples of Grecian or Gothic art, but to repress it altogether. At all events, however, this is no reason why the more talented should be interdicted from doing what others cannot. The Germans have less of this Neophobia in architecture than almost any other people;—Schinkel we need not name, but as another strong instance of the free scope allowed in invention we may refer to the *Architectonisches Album*, which contains designs by Stüler and Strask for the buildings proposed to be attached to the railway between St. Petersburg and Pavlovsk. The length to which our article has reached prevents our entering into any observations upon them; all therefore we add is, that in this age of railroads it is to be hoped that their "stations" and "termini" will be allowed to afford some employment for architects, and originate a class and style of buildings totally distinct from those we have at present.

ART. V.—*Akhlak-i-Jalady, from the Persian of Jany Mohammed Asaad. Practical Philosophy of the Mohammedans.* Printed for the Oriental Translation Fund. Translated by W. F. Thompson, Esq. of the Bengal Civil Service. London: 1839.

ALTHOUGH the labours of the Oriental Translation Fund have been so long before the British and Foreign public, and though the Society itself, in the years that have elapsed since its formation, has fully sustained the promise of its commencement, and brought to the European eye so many of the treasures that lay till then hidden in the obscurity of oriental languages; although the relations of Europe with the East are hourly and daily increasing both in number and importance; although the connection of these two portions of the globe has long been cemented, and on the part of Great Britain in particular most closely by ties of family or personal interest—as well as affection;—though the growing importance of eastern countries commercially and politically, stimulates alike both selfishness and philanthropy, public and private, to foster the cultivation and improvement both of the soil and inhabitants of the various realms of Asia;—though the neglect of these obvious considerations has repeatedly entailed disaster and distress upon whole bodies of individuals in Europe, if not upon its nations; and though these evils have been undeniably brought about by ignorance, not less on the one side than the other:—of the Asiatic, as to sound, enlightened principles of domestic government and foreign intercourse; of the European, as to the real character, prejudices, and peculiarities of the nations with whom he has to deal: still, despite of political existence, of personal interest, of private ties, of philanthropic objects, philosophic views, antiquarian research, religious feelings, and even, far dearest, of pecuniary gain; the British public, the most deeply interested of any in most, if not all of these questions, has shown the greatest apathy of any in proportion to its situation and facilities with all.

It can scarcely be questioned that this neglect has arisen from want of due consideration in the generality, and in sheer ignorance rather than wilful disregard of more expansive views. So long in that quarter as trade could be pushed and fortunes made by the mercantile community: so long as political alliances were anticipated and forestalled by physical force and absolute subjugation, with the statesman; so long as the scholar could confine his intellect within the narrow and insufficient bounds of classical information, the natural indolence or cupidity of each

class, for its own immediate objects, prevented the attempt and the wish to look beyond: nor is it till the usual consequences of all short-sighted policy are visited upon us with the worst severity, till China has repelled our opium and refused her teas—till from Turkey to Burmah all is trouble, violence, and injustice—till history turns, hopeless, from the pages of Greece, and the key of Egyptian hieroglyphics is broken in that rude and rusted lock—that we begin to suspect there has been something amiss. The rupee-tree of Hindostan has been shaken of its fruit, and the balances of silver syce mock the opium's wakened dream:—if we soothe the ruined Turk, we are hated by Burmah, Cabul and Persia; and the boast of classic elucidation proves but its delusive vanity. Had those three great classes of our countrymen studied with a larger and more comprehensive intellect the spirit of Eastern nations, as developed in their institutions, they would have seen that neither the commerce, the policy, nor the genius of these nations could be actuated by the same rules that form the standard of Europe.

It is the learned who are chiefly to blame: for the knowledge derivable from books is their avowed care; through them must it flow in gradual and practical wisdom to the other classes of society; and it is for this that their seminaries are endowed by the liberal, and supported and guarded by the State. The scholar, placed from certain evidences of his ability in situations of honourable competence by the institutions of his country, owes that country a positive duty in return: his ease is not consulted that it may degenerate into sloth, his library is not stored that he may close his eyes in repletion, his pockets are not filled to be merely emptied into his chest, nor is the earlier leisure of his college intended as a dormitory. The man of learning, so placed, is bound to look abroad as well as at home; the living world of literature is his proper sphere; mental activity is his duty, to himself and his countrymen; and if he fails in this, and, wrapping himself up in the fat slumbers of contented prejudice, neglects to acquire or circulate the information to which he should be devoted, he injures the charges intrusted to his care, and abuses the hospitality that feeds him; he is a false steward, an ungrateful guest.

A vulgar error has gone forth lately into the world that only a little learning is a useful thing, and shallowness is the order of the day: even the greater number of the really learned who openly oppose this dictum, act, though with some modification, upon its principle. But is it necessary, we would ask, that if a long portion of life should be

devoted to studying the wisdom of antiquity, that a still larger portion should be wasted in shutting out, or rejecting, wisdom from any other entrance? Surely he who has learned to weigh and feel the pure spirit of ancient genius, is the very fittest to weigh and appreciate the sense of other nations. Why, having studied in one point, should he exclude all the rest? Why confine himself to one or two languages when there are twenty open to him? Is there no possibility of a stimulus after manhood? no exercises, no degrees, but those for boys?

Did the statesman assist the formation of new progressions of real knowledge at home, he would not be so often mistaken as to the genius of distant nations. Fellowships might be created, endowments directed to cherish, and honours to reward the cultivators of such wide fields. But his should be, not a direct but a moral influence; his duty is to lead the public energies, not to bribe them: he might act on public opinion, and this would act on the universities.

And here would be the gain of the merchant. He would not by force or fraud violate the laws of man and God so widely and so generally, did he know that the races he scorns as barbarians have rules of conduct and justice, and would yield more profit by cultivation, care, and management, than by treachery and wrong. If sufficiently enlightened himself he would seek to enlighten others, as the surest way to attain his ends at last.

If the statesman is less obviously interested in the question, it can be only because the interests of the community are vested in him, to be maintained in preference to his own. But if his own glory and the good of his country are at heart he will duly feel the advantages to be derived from the progress of civilisation and enlightenment, not only in those lands but at home, and with himself: since by becoming, so to say, practically conversant with the habits and feelings of distant and barbarous nations, he learns to know and appreciate their position, capabilities, and wants, and is prepared to avail himself of these for the welfare of his native land, the consolidation of her strength, enlargement of her relations, the increase of her influence, and diffusion of her commerce. It is only by a thorough acquaintance with all that is around him that he learns to enter into and familiarize himself with the spirit and national feeling of every part;—a point too long neglected:—and it is only by the distribution of this information, thoroughly infused into the daily nutriment of his nation at home, that he can expect to be supported by them, as the vigilant guard and watch-post of their communal rights. Had such measures been

taken and such vigilance exerted in proportion to the growing interests of our political and commercial relations with the East, would Dost Mahommed have been rejected as an ally till he was forced or won over into enmity? would Turkey have been neglected till she sank,—or Persia affronted till roused into querulous wrath? would Central Asia have to be only now explored, to ascertain her political and commercial tendencies? would the Indus trade be but now attempting? would indigo be growing wild, and opium till lately unknown, in Ceylon? and would not Assam, if explored and cultivated some very few years sooner, have by this time afforded an ample supply of that tea, which is the sole link of China to Europe, beyond the infamy of national smuggling? These are not considerations for the minister alone; they are the vital points of that commerce on which the greatness of England depends; and private fortunes and public welfare alike demand exertions, new and ceaseless, and forbid the statesman's slumbering at his arduous post, or confining his views and energies to the narrow scale of Europe alone, unless he would cramp, embarrass, depress, and finally ruin, the merchant.

In all questions of national and other importance the Future, to be successful, should be the child of the Past; and the speculations that are to bias and control the former must be based on the experience acquired through ages of existence. The moments of the Present are but the passing steps by which life mounts from that Past, to the Future of unhorizoned and indefinite Time. If we would that this shall bring something more than barren repentance for ourselves, and a legacy of errors for our descendants to correct while they execrate, we must strive to extract the spirit of ancient and modern information, and shape it into the Ethics of political and national conduct. Yet to examine but a portion of the world is to dismember reason, and destroy half the reign and more than half the efficiency of wisdom. Where has information been narrowed that it has not become a mockery? and when has inquiry rejected a whole series of facts without turning the rest into a destructive fallacy?

If such are the data of the active world, they do not change their form in the speculative. We would ask the renowned scholars of England and Europe, and centuries upon centuries stand included in the question, How much of antiquity is really known to them—how many ascertained facts they have disinterred by their labours? The statements of Sanchoniatho are given up as a hopeless jumble; the traditions of Berossus as unsupported and unsupportable? the early

texts of Holy Writ are but the Pelion and Ossa of successive strife: the realm of Creation but a listed battle-field for the church militant of Geology! Where are the first fourteen dynasties of Egypt—and where the mocking promise of hieroglyphic revelations? Whence came the Greeks, whom we know to have sprung from the ground; though we know also that they descended from ancestors, of whom also we know—that they and we know nothing? Who were the Etruscans, and whence arose their rites? What was the early history of Rome? and how comes it better known to two modern Germans than to its actual inhabitants? Cannot 3000 years of Classics assist us to a few facts?

If then their scope is inefficient, should not learning extend its range, instead of sitting down in the Professor's chair of ignorance? Surely the eagle wings of European science had long enough been spread over the barren East, before the Chinese loadstone and printing were known to Europe: Eastern niceties of mathematical measurement, even late in our days, have been brought in to rectify, and enlarge, the calculations of the West: and an earlier effort than the recent and rational inquiry might long ago have taught Britain the ready manufacture of steel by the principles of chemistry, known in India ages before the days of Alexander! The oversight is surely a stigma upon our unquestionable intelligence, and no less unquestionable indolence and self-sufficiency.

If Science, thus improved, will still ignore all Eastern advances, is Learning to follow her example and be content to stop her career altogether? How can the heart of the scholar rest satisfied to rely, in his ignorance of antiquity, upon those classical authorities, whereof the Greek is fable, and the Roman, falsification! Both fall confessedly short of the truth he seeks, or at least affects to seek; and yet he is content to be told by one or two earliest labourers in Oriental fields that nothing there will assist him. Surely the scansion of Greek writers in Greek tragedies is not a more important inquiry than to discover how the Greeks (the Romans after them only), the Indians, and the Chinese came to have a theatre, so totally

* The tree-dwelling Kookies of Dr. Spry would not have astonished the reading world had the account of that race, published forty years ago, been better known to Europe; or the Vedahs of Ceylon, who live in the same manner, shunning all intercourse; and who, when in want of an arrow-head, &c., leave the weapon, with a leaf shaped like the intended head, by night, near the dwelling of some more civilized smith, and pay his labour by the present of a deer, left in the same manner afterwards.—See the forthcoming work on Ceylon by J. W. Bennett, F. L. S.

unknown to the Babylonian, Persian, Celt, Arab, and Turk. Yet judge for himself he will not : and so long as he can shroud his senses in the thick cloud of a dreaming mythology, the Modern will know nothing with which his favoured Ancients were unacquainted, and rests ignorant of learning lest he lose the name of learning with the ignorant.

Yet can Universities, British or Foreign, answer the difficulties, purely CLASSICAL, or connected with the Classics? And if they cannot, ought they to withhold assistance from those societies that are striving directly and indirectly for the solution of such? Is it not a conjoint object; ought it not, therefore, to be also a conjoint effort with them? Let CLASSICISM tell us,—

Who was Deucalion? Who was Ogyges?

Who were the Thracians—and their Mars?

Whence came the Gods of Greece?

How came the tale of Tereus and Philomela into Greece?

How is it that the traditions of the East constantly assimilate to the allusions in Homer?

How comes the conformity of the story of Circe with a tale of the Ceylonese?

Whence is the story of Polyphemus known in India?

Who was the musician Thamyras?

Whence came the name of the Syrens?

How came the Doric forms in the Tamul?

What is the etymology of the word PENATES?

What was, and whence originated, the primary difference of the Greek and Roman worship?

Whence comes the identity of the stories of Osiris and Hothir?

Who were the Phœnicians?

Why do Greek and Latin resemble the Sanscrit?

Did India borrow cards* from Europe?

How is it that the Egyptian crown, and Egyptian name, of Priest, are found in Ceylon—and of the Chief Priest only?

How comes the English letter, I, to be the Eastern a-ee, the Greek and German e-i? and whence the identity of these?

How are so many peculiarities and provincialisms of the English tongue purely Eastern?—the same of the French and German?

What is the origin of the name of Rome?

Why was February the ancient Persian and Roman month of purification; and Valentine's day sacred to the Indian god of matrimony?

We are well aware that the answer to various of these queries will be referred to the intercourse of the Greeks &c. with Asia: but it will require a very respectable degree of ignorance as to Eastern customs to affirm, that the more important and fundamental of these coincidences were received by the natives of the East from strangers and conquerors, and incorporated by them into their historical, grammatical, and religious systems, careful as these are to exclude everything extraneous. Did the Chinese theatre spring from that of Thespis? Or did the Tamul, confessedly as old as the Sanscrit, if not older, form its compounds to suit the phantasies of Greek fable? Did the Macedonian, or the Roman, minutely locate Scandinavian traditions, with more than their Northern detail, into particular Asiatic districts?

To hear the lame answers or more lame evasions of these questions is far from a jest, even to the most laughter-loving who thinks of the ignorance thus implied in the minds of the learned. Had Selden himself been at all an Eastern philologist, would he have hesitated to prove his supposition as to the identity of Moloch with Adramelech by the ancient Persian Adar, fire, through which the children of Moloch's worshippers had to pass? Would one great maxim of Christianity have been insisted on by some divines as singly a proof of the heavenly origin of our creed, had they known that it was included in the sayings of Confucius, 500 years before? Such deficiencies in such men!—

Who would not laugh if any such there be?

Who would not weep, if Atticus were he?

But, to go one step lower with our argument, we would notice a ludicrous error at present getting into vogue in our Schools. In former times the difference of quantity in long and short syllables was perfectly understood but never attempted, unless in scansion. It is now the common form of prose reading also. The recognition of the principle is undoubtedly correct, but the practical application altogether as erroneous. Take, for instance, the word Λῆγος formerly pronounced Lōgos, now Loggos;—is not the latter quite as bad as the first? The difference of short and long syllables is clearly the Oriental system of vowels written and unwritten. Whether we take alphabets or syllabaries this applies equally. In the Eastern form the faint vocalic sound following the first consonant, and represented in Greek by the ο short, (a substitute too for the υ or ε of Asia,) would preserve to that consonant its

* See note to page 191.

pure syllabic quantity, but not run this into the next syllable as though the word were *Log-gos*, and not *Logos*. This strange and growing error originates obviously in ignorance of the Oriental form of speech, and forgetfulness that the Greek is derived from thence. But to return:—

It is not our wish, it is not in our province, it is neither in our design nor our power, to meddle with the institutions of our Universities. For us it suffices that the fruit they have borne has been the principal means of making England what she is. When we see another country excelling her in free institutions of government, high-toned policy, and generous patriotism, and this too persevered in for centuries amidst comparative barbarism, it will then be time enough to inquire after the novel source of these moral blessings. In the mean time we shall leave state-quacks to theorize on perfectibilities that are to be as lasting as eternity, perhaps because they are as utterly incomprehensible.

But when we calmly consider existing circumstances, we must admit that politically and commercially, as well as in a literary and historical view, the knowledge of the East is hourly growing in importance to England. If then all classes are directly and indirectly concerned, it is no longer a matter of indifference that the two great Societies formed for prosecuting inquiries on this head, should be neglected by the people and the government. Hitherto they have been discouraged to the utmost; and where is the source of re-action to begin? Is it with the Universities and Learned Institutions? or with the Government? Oxford has honoured itself by the choice of professorships and professors, but how many are they that attend to them? We have heard lately of the present Bishop of Calcutta preaching everywhere in the native tongue to the natives. If this were looked on as an exemplar: if the aspirants to clerical, military, and diplomatic preferment all over the East, were to be certified that none but those who had acquired tolerably, if not distinguished themselves in, the several languages necessary for their respective stations, could be eligible for advancement,—what an impetus would it not give to the acquisition and diffusion of Oriental knowledge? Would the professorships be merely sad sinecures? Would the seniors of the University, fellows, and residents, be, as now, ignorant of and indifferent to the study?

The necessary connection of European and Asiatic studies thus brought prominently forward, the establishment of the Asiatic Society in a set of chambers in one of the

government buildings would scarcely be a matter of less national importance than the similar grant to the Royal Academy. Will the Whigs who boast to usurp the patronage of merit at the present day, fall short of that liberal act of George the Third? And were the Asiatic Society,—(which, unlike other Institutions in England, requires so large a capital, and is so confessedly unpatronized by the public; its proper supporters too living for the most part abroad in distant lands;—) were the Asiatic Society thus enabled to display its treasures and give greater publicity to its proceedings, would even the British Museum itself offer a much greater source of improvement, instruction, and interest, to the British public? The meetings of that body comprise the most entertaining matter in the shape of foreign information to be met with anywhere, and much of which never finds its way into print. The upper classes of English society, who feel the worst tedium of life, and are, like their Athenian prototypes, anxious only for some new thing, would come forward to support the desideratum with their purses, were they but sensible of its existence.

And what to the Nation would be the cost of this grant, if mooted, as we hope to see it, in Parliament! A very few thousands at the most,—hardly so much—to enable England to figure in her proper station to Europe as the great leader of Oriental investigation, as she is the great proprietor of Oriental possessions. A National grant would be a National DUTY; and not less a National GAIN, in the shape of instruction and amusement to the people. And it is a mere trifle that would do all this; the small fraction of a single item in the national expenditure. Nor could other societies complain of this; unless they could show the same paucity of exchequer with the same importance of range, as the Asiatic Society, and its Siamese twin, the Oriental Translation Fund.

While on this subject we would also recommend Parliamentary assistance, to procure admission to, and examine, the Jaina records discovered by Tod, of which we gave some notice in our last Number, (p. 80,) and now refer for particulars there, and to the end of this Article, (p. 186.) British gold and influence would conquer native reluctance; but some management will be requisite.

It is, then, the duty or advantage of the three great classes we have referred to, to cherish and foster any system of improvement, any course that tends to throw a light upon the world. Yet the objects of the Oriental Translation Fund, which are simply

these, have met with little support and assistance comparatively from either. How long is this to last? Mr. Bryce affirms that Eastern works, printed at Calcutta, are sought for more in Germany than in England. In the former, we ourselves can state, Oriental literature is far more general than in Britain. How is this? Are the Germans more rich, more wise, or only less selfish than we?

The Translation Fund is taxed to the utmost, the Asiatic Society confessedly impoverished; yet ours is certainly the richest, presumed the wisest, and, on these points, the meanest nation in the world. The cares and honours of ministerial patronage would be injurious, the wealth of collegiate communities perhaps destructive, if applied to support the cause of learning and literature beyond the precincts of Court and University!

What can result from this but depression and disarrangement, and consequent ignorance sufficiently gross to clog the very march of common reason? We have been told, for centuries, that Mahommedanism opposes literature and learning; that the Turks were the most stupid of Mahommedans; that their sacred tenets were adverse to improvement and to good government, and that, therefore, the Turks should be driven out of Europe, and the Greeks substituted in their place. So insisted THE PUBLIC! Hence sprang Navarino and the present political state of armed neutralities and confederacy.

Could the public have been persuaded that the unhappy Mahommedans do sometimes write and think, they would not have urged a crusade against Turkey for desiring not to be robbed. In this spirit the first work at the head of our article may save us yet from a league to expel the Turks from their country, because they do not read Watts' Logic and go to prayer upon Fridays. What serious argument should meet the random assertion that Mahommedanism is inimical to good government?

Mr. Thompson, of whose labours as a scholar and writer, poorly as they have been recompensed, we cannot speak too highly, well observes,

"The mere rivalry, so long and closely maintained by the Muslims, not so much with ourselves as with all the western nations, ought to be sufficient to bespeak our interest and attention, even if there were nothing else in their previous history or internal condition calculated to attract our notice. From the eighth to the sixteenth century the contest seemed to threaten the liberties of Europe. The Turkish and Egyptian dy-

nasties—mere outposts of the great body of Islām—were able, at different periods, to encounter and baffle the united forces of Christendom: and while Europeans consoled themselves with imputing to their adversaries a social barbarism and vitiation inconsistent with their political power, they tacitly belied the flattering apology by borrowing that scholastic literature, which, however worthless as an end, was valuable enough as a means, to raise the borrowers to their present state of mental and physical superiority. Of a people once so distinguished in the opposite achievements of arts and arms, are the laws and habits of action to be counted among the contemptible phenomena of history? Look at their results as compared with those of other institutions; even (at one time) of our own. Are they worthy of authentic elucidation and remark? The following is their own exposition of them; formed in the age of their greatest prosperity, and received by their then most polished people as the completest ever produced."—pp. xvi. xvii.

The following view of the circumstances that preceded the composition of the work is as new as it is instructive.

"During the infancy of the Osmanly empire, while its shocks were already felt to the remotest limits of Europe, but before it had completed the occupation of the fairest of European provinces, its energies were curbed and controlled on the east by the imposing aspect and vast resources of that great central monarchy, which, differing only in its limits and the blood of its ruling tribe, has always been paramount in the heart of Asia. In the days of which we speak it had lately been restored, with unusual splendour, by the arms of the great Timúr, and was still governed by the greatest of his descendants. The æra of Ulug Bég and Husain Abulghazy (or latter half of the fifteenth century) may indeed be considered as the Augustan age of Persian letters. Few potentates of that time but were themselves adepts in the learning they patronized. Ulug Bég was a distinguished astronomer; Abulghazy a poet and essayist of no mean rank. At the court of the latter, in particular, his excessive encouragement of the lighter literature to which he was devoted, had raised up a host of polished and enlightened writers, who seemed to make up, in elegance of expression and refinement of idea, for the want of that solidity and power, which is seldom to be found except in the train of re-action from the hardships of unmerited neglect. Over estimation proves in the end the most fatal form of discouragement.

"While the Timúrian princes of this period were struggling with each other for paramount supremacy, or devoting themselves in supineness to an ostentatious rather than a wise cultivation of their subjects' interests, a character of a far different school rose silently into power on their south-west-

ern frontier. This was Hasán Bēg, the representative of a house placed by Timūr in precarious authority over the province of Mesopotamia, and forced to depend for the maintenance of their position, not on the influence of a name, but on a perpetual and practical display of nature's best title, the ability to maintain it. * * Thus two hostile princes, one of them the reigning Mogul, were captured and put to death; and such was the resolute demeanour he maintained, and the capacity on which it was known to rest, that Abulghāzy, the succeeding emperor, dreaded to attack though unable to conciliate him. His next attempt entitles him, in some sort, to be considered as an auxiliary of the Christian cause, being directed against the Turks, then hardened by yearly contests with the Hungarian chivalry, and led by the enterprising conqueror of Constantinople, Muhammad II. In an invasion of their empire he was repulsed; but the light in which he was held as an antagonist may be inferred from the fact, that his dominions were safe from reprisals as long as he was alive to defend them: and had his reign been one of longer duration, the words of the panegyrist, who asserts his ability to become the paramount sovereign of Asia, might have been justified by the event.

"Under the auspices of this prince, and in analogy, it may be said, as regards the prevailing literature of that period, with his political position, the '*Akhlāk-i-Jalāly*' was produced: a work which, in the importance of its subject matter, and the forcible character of its treatment and language, contrasts strongly with the empty elegance of the compositions most in vogue at the court of Abulghāzy. On this too, as on other occasions, the victory of letters proved more durable than that of arms. Long after the names and fortunes of their respective patrons had been consigned to the sepulchre of history, the '*Akhlāk-i-Jalāly*' continued to afford delight and instruction to statesmen, while the polished essays of Kāshifī and Suhailī were abandoned to the imitation of boys."—p. xvii-xx.

The following passage, comparing the state of philosophy in Europe with that of Asia in past times, unites great ability and originality with great eloquence.

"The translation of this abstruse and elaborate work was undertaken principally in order to illustrate and exemplify the resources of Persian literature, with a view to their bearing upon a question of great practical importance in our Eastern possessions. Of late years it has become a favourite position with those who know not how to explain by any more modest or humane theory the social degradation of the Asiatic people, to attribute it to some radical error in their scientific systems; in other words, to a want of average capacity in the inhabitants of that half of the globe to which the supposers do not happen to belong. The consequences

they deduce are worthy of the liberality of their premises—that Asiatic learning must be extirpated root and branch, and replaced by that of Europe. Now, with such a treatise as the present in our hands, we might be excused, perhaps, if we overlooked the fallacy on which the conclusion proceeds, and chose to retort the charge of incapacity on the opposite side. Here, we might say, is a work of the fifteenth century, displaying a knowledge of the nature, and an enthusiasm in the cause of virtue, which will render it a delightful and improving study, as long as duty and inclination continue to contest the world. What European work of the same æra, as richly laden, as widely known, and as long surviving, will you venture to weigh against it? Political convulsions cut short the flattering promise of further improvement; but as long as the opportunity was given, where will you find a richer harvest?

"Such, however, is not the warfare of a minority. Until the general mind is better qualified to enter on such a discussion with the impartiality it requires, we must leave the diversities of Muhammedan literature to work their own way in public estimation, and take our stand on the surer ground of its resemblances.

"From a comparison of the present work with the authorities it professes to consult, it appears that Muhammedan philosophy is neither more nor less than Grecian philosophy in an Eastern garb; a twin offspring of that common parent from which the sciences of Europe are proud to acknowledge their derivation. Admitting that, for the last two hundred years, the period during which these latter have made their greatest advance, the former have been comparatively stationary, the two systems must still have so much in common, as to make it mere contradiction to speak of establishing either on the ruins of the other—of destroying that which, properly used, will be found to afford the best and safest means of effecting the purpose for which it is destroyed.

"But with sciences (which are near akin to institutions) the question is not merely what had better be done, but what can be done. The processes of development, to be genuine, must be voluntarily or rather spontaneously conducted. Where mental relations are formed and mental systems transferred, previous analogies must subsist in order to make them applicable; and in the instance of Greeks and Arabs we trace them in the resemblance of their early national traits. The predatory habits and generous cast of feeling—the government fluctuating between the paternal and fraternal forms—the national independence maintained for ages, in defiance of the great powers by whom they were successively assailed—the prevalence of the imaginative, the traditional, and the mysterious—the airy kingdoms of antediluvian beings—the swarms of genii retreating from the visible creation and the face of lordly man, only to lead a more congenial existence in the hidden

powers and principles of nature—the hosts of heavenly messengers ever on the wing to comfort or admonish an erring but still favoured race—the tribes of birds and animals softening and hallowing the course of life by the moral lessons fabulously associated with their habits and appearances—these, the primitive characteristics of either people, require only a little adjustment of names and instances, in order to be at once identified with a counterpart in the other. From these princely savages it is, and from that purified abstract of their principles and feelings which the laws of Muhammad present, that all the races and ages of Islām have taken their form and character. As if to maintain the analogy after as well as before the point of social organization, corresponding to the Eleusinian mysteries of the Greeks we have the Sūfyism of the Muhammedans; a transcript probably of the same doctrine, concealed by a phraseology which rendered the secret little less impenetrable than the imposing mechanism of the mystagogues. The transfusion of science from one to the other of these two people was the introduction of nothing but formulæ and processes. The rudiment—the element—the embryo—was there ungiven; ready in the one case as in the other, on the application of the requisite means, to unfold itself into progressive maturity.

“What resemblance, what analogy, has the cold and gloomy spirit of the North to offer in furtherance of a similar union—now too, when its nations have outlived the first tendencies of their rudiments—when the influence of the elements themselves seems lost and overwhelmed in the uniform pressure of intense civilisation? One, and one only—the pre-constituted affinity of their speculative systems in virtue of a common and intermediate origin. Singularly enough, then, this futile endeavour to unite the people of the East and West, by depriving the former of their intellectual treasures, turns out to be an attack against a bond of union most providentially provided already, and the only one of which the parties are readily susceptible. As Greece was the border or neutral ground upon which the opposite elements of Asiatic and European character resolved themselves into harmony, so Grecian science, the offspring of this intellectual concert, is still the moral mean or menstruum of its maintenance at other times and places. The Asiatic treatises and tongues in which this science is modelled after eastern prepossessions, instead of being extirpated as superfluous, should be cherished as the best and only vehicles of an invaluable sympathy not otherwise to be obtained.”—p. xxiv-xxvii.

The following is of some interest on the speculative philosophy of Europe.

“Another value the work may possess in the eyes of the curious, at least, inasmuch as it is a specimen—certainly a favourable

but still a specific specimen—of those scholastic treatises by which the intellect of Europe was exercised and prepared for the paramount achievements of the present age. It happens, singularly enough, that the capture of Constantinople, and the dispersion of learning among the western states, synchronize within a few years with the publication of the ‘*Akhlak-i-Jalāly*.’ So that at the very period when the earlier systems of moral philosophy were in course of communication to the confines of Europe, they were being promulgated afresh in Central Asia in the improved form given to them in the present compilation. Smile as we may at the crudity of their notions upon some points, and the extravagance of them upon others, there is an interest that must always attach to the ideal systems which have strongly influenced large portions of mankind, and our own progenitors among the number.”—pp. xxxiii. xxxiv.

The care and judgment displayed by the translator in every page of this work are the more valuable, as till now we possessed no means of fairly comparing the system of the Greeks with that of the East. We trust that Mr. Thompson is or will be enabled to prosecute such inquiries as these to the utmost, for they throw a totally novel light over the ignorance in these matters existing in Europe.

As the work must certainly take its place in every collection of philosophy and metaphysics, we need do little more than extract from it a singular anecdote, evincing the power of philosophy over a victorious prince. It is from the chapter “On the Government of Kingdoms and Observances of Kings.”—

“We are told that Hasān the Bowide, who in his day possessed the sovereignty of Herat, and was conspicuous above all the princes of his age for attachment to men of learning and wisdom, undertook a holy war with the Roman empire. In the outset of the contest victory sided with the army of the faith, and the infidels were completely defeated. On this the Romans raised a *levée en masse*, and, concentrating their forces from all the outposts, again offered battle to the army of the faith. These were then obliged to give way, and some of them were so unfortunate as to be made prisoners. When the king took his seat to examine the captives, there proved to be one among them from Herat, named Abū Nasar. On ascertaining this, the king said he would entrust him with a message which he was to carry to his emperor. Abū Nasar answered that he would do his bidding. ‘Then tell Hasān the Bowide,’ said the king, ‘that I left Constantinople with the purpose of devastating Irāk. Now, however, that I have inquired concerning his character and situation, it is clear to me that the star of his prosperity has yet to reach the zenith of its

completeness, and is still in the ascendant of its fortunes. For one whose star was sinking in the void of extinction, and the twilight of supineness and evanition, would never have about his person men of such high attainments and noted excellence as Ibn Abîd, Abû Jaafar, the treasurer Aly bin Kasim, and Abû Aly Yashâghy. The assemblage of such a galaxy in attendance on his court is sufficient proof of the firmness of his fortunes and the farther improvement of his position and renown. For this reason I leave his dominions unmolested.'—pp. 391, 393.

The importance of forming the female character is strongly dwelt upon in the chapter "Of Wives." The oriental Chapone, or Meiners, relates the following anecdote :—

"We are told in history, that Hajaj had a chamberlain, with whom, having been long acquainted, he was on very familiar terms. In the course of conversation, he happened one day to remark, that no secrets should be communicated and no confidence given to a woman. The chamberlain observed, that he had a very prudent and affectionate wife, on whom he placed the utmost confidence; because, by repeated experiment, he had assured himself of her conduct, and now considered her the treasurer of all his fortunes. 'The thing is repugnant to reason,' said Hajaj, 'and I will show you that it is.' On this he bade them bring him a thousand dinars in a bag, which he sealed up with his own signet, and delivered to the chamberlain; telling him the money was his, but he was to keep it under seal, take it home, and tell his wife he had stolen it for her from the royal treasury. Soon afterwards Hajaj made him a further present of a hand-maiden, whom he likewise brought home with him. 'Pray, oblige me,' said his wife, 'by selling this handmaiden.' The chamberlain asked how it was possible for him to sell what the king had given. At this the wife grew angry, and, coming in the middle of the night to the door of the palace where Hajaj resided, desired it might be told him that the wife of chamberlain such-an-one requested an audience. On obtaining access to the king, and after going through the preliminary compliments and protestations, she represented, that long as her husband had been attached to the royal household—bondsmen as he was to his majesty's favour, he had yet been perfidious enough to peculate upon the privy purse; an offence which her own sense of gratitude would not allow her to conceal. With this she produced the money-bag, saying it was the same her husband had stolen, and there was the prince's seal to prove it. The chamberlain was summoned, and soon made his appearance. 'This prudent, affectionate wife of yours,' said Hajaj, 'has brought me your hidden deposit; and were I not privy

to the fact, your head would fly from your shoulders, for the boys to play with, and the horses to trample under foot.'—pp. 269-271.

Before we quit the subject of Mohammedan metaphysics we must notice two passages from the work of* Sir Graves Haughton, whose general high talents, and intimate acquaintance with the Sanscrit doctrines on this subject, as shown in his elucidation of the word MAYA against Col. Vans Kennedy, we noticed long since; they give additional value to his opinions in the volume before us. It is clear, and satisfactory. Sir Graves points out a singular coincidence of terms between the schoolmen of a past age and the East :—

"Entity, implying *being-state*, or *beingness*, stands for anything that is real; and is certainly a harmless word, as long as it is not made to pass for something real by its own nature. *Quiddity*, derived from the *QUIDDITAS* of the *Schoolmen*, is deduced from *QUID*, *what?* and therefore implies *what-state*, or *what-ness*; though they used it for *Essence*; it being held, by the 'Realists' among them, that every abstract relation had a real *Essence*, through which it had its being: but Locke's reasonings having shown the absurdity of the notion, which indeed had been long questioned, the word sank into complete disuse, except occasionally to whet the wit of modern metaphysicians."—p. 56.

"The Arabs would appear to have represented this word by *MAHIYAT*; which is of very singular formation, being contrary to the general structure of their language: it implies *what-is-it-ness*. In the Sanscrit language, the word *TATTWAM*, meaning *that-state*, or *that-ness*, seems its exact representative. These analogies are curious, as showing the limited resources of the human mind, and the similarity of its mode of proceeding under any difficulties it has to surmount. *Quiddity* and *Entity*, though they have now parted company, seem to have represented the *Essence* and *Form* which we occasionally hear contrasted with one another."—p. 57.

Another instance is as follows :—

"The delusive influence of language over the mind is equally shown in Algazel, the Arabian: of him it is said, that 'he denied a necessary connection between Cause and Effect; for of two things, the affirmation of the existence of the one does not necessarily contain the affirmation of the other; and the same may be said of denial.' When Algazel

* *Prodromus*; or an Inquiry into the First Principles of Reasoning, including an Analysis of the Human Mind. By Sir Graves Chamney Haughton, K.H., M.A., F.R.S. &c. &c. London: Allen and Co. 1839.

denied a necessary connection between Cause and Effect, he quite overlooked the fact, that these two words were not merely Relations, but that they were, moreover, of that kind in which, as I have before said, Effect is the Correlation of Cause: and that, by this very circumstance, they imply one another, and consequently must be necessarily connected. Cause must, therefore, as uniformly suggest the notion of Effect, as Father does that of Child, and Husband that of Wife. But when we have convinced ourselves of this fact, it still cannot be applied to prove, as Algazel remarked, that, of 'two separate things, the affirmation of the existence of the one necessarily contains the affirmation of the other.' Algazel, therefore, was both right and wrong. He was wrong in his inference, which is the leading member of his sentence; and he was quite right in the last clause, which is that from which he drew it, though his assertion was a mere truism. His mistake arose from his not being aware, that, in the first case, he was dealing with Abstract Relations; and in the other with Realities, as is proved by his employing the words 'two separate things:' he, consequently, made the mistake that is inevitable from confounding together these opposite classes of words. Algazel's error is that of all metaphysicians. They forget that the Perception is a Thing; but that the relation in which it stands is a mere Conception."—pp. 105, 106.

We are, however, particularly struck with the arrangement "of various metaphysical categories" towards the close of the volume, to which we shall one day hope to return. The curious will in these few pages of Sir G. Haughton's work be able to compare at a glance Plato, Aristotle, Gautama, Jaina, Zoroaster, Locke, Kant, and Schelling. A tabular view of each, and concise explanatory remarks, simplify the labours of those eminent men to the commonest memory and intellect. We give but a bare outline.

PLATO.

"His five forms are as follows—

- Substance.
- Similitude.
- Diversity.
- Permanence.
- Movement.

"As commentators give a different interpretation to the five forms, the original terminology is subjoined:—

οὐσία, the principle, essence: *ταὐτόν*, the same; regarding the relation it bears to itself and other things: *ἕτερον*, the other; when one varies from another: *στasis*, while it keeps its station, or preserves a unity; *κίνησις*, motion, or that by which it exerts a power to act.—
Franklin, De Nat. Deor.

ARISTOTLE.

"His ten categories are commonly translated as follows:—

- Substance.
- Quantity.
- Quality.
- Relation.
- Place.

- Time.
- Situation.
- Possession.
- Action.
- Suffering.

(*οὐσία, πῶσον, ποῖον, πρῶτον, ποῦ, πότε, κείμεναι, ἔχειν, ποιεῖν, πάσχειν.*)

"It will not be uninteresting to compare the foregoing divisions of the academic and peripatetic schools with those of India. There is such a general affinity between them, that they could not have had an independent production, but must have stood more or less in relation of parent and offspring, whether the originality be conceded to Greece or to India. It may, however, be remarked that the Hindu systems are all complete and peculiar in themselves; and every part is in harmony with the whole, of any one system, which likewise contains principles totally unnoticed by the Greeks. * * * It bears, in short, pretty nearly the same relation to the system of Aristotle, that their Algebra (confessedly of Hindu invention) does to the state of that science in the present day.

GOTAMA

"Is the reputed founder of logic in India. The division of 'The Predicaments,' or 'Objects of Proof,' are six, according to Kanada; viz:—

- Substance. Community.
- Quality. Particularity.
- Action. Relation (intimate).

"To this arrangement other authors add a seventh, Privation or Negation. Besides these categories, others are alleged, by different authorities.

"Mind, in common with all substance (for they hold it to be such), is the substratum of eight qualities; viz:—

- Number. Disjunction.
- Quantity. Priority.
- Individuality. Subsequence.
- Conjunction. Faculty.

"This arrangement is made by Kanada.

JINA.

"The Jainas (followers of Jina), who are an ancient and a celebrated sect in India, and have so many opinions in common with the Baudddhas (followers of Baudddha), as to have been often confounded with them, hold that there are five Kârana, or Causes, which unite in the production of all events. These are as follow:—

1. Time.
2. Nature.
3. Fate or Necessity.
4. Works, or the Principle of Retributive Justice.
5. Mental Effort or Perseverance.

"The Jainas, besides the above, comprehend nature under the six following categories; viz:—

- 1. Motion.
- 2. Rest.
- 3. Vacuum.
- 4. Time.
- 5. Life.
- 6. Matter.

ZOROASTER.

“ The next system is that of the divisions of the soul, which the Parsees, or descendants of the ancient Persians, attribute to Zoroaster.

“ The soul of man, instead of a simple essence, a spark of that eternal light which animates all things, consists, according to Zoroaster, of five separate parts, each having peculiar offices ;—

- 1. The Feroher, or principle of sensation.
- 2. The Boe, or principle of intelligence.
- 3. The Rouan, the principle of practical judgment, imagination, volition.
- 4. The Akho, or principle of conscience.
- 5. The Jan, or principle of animal life.

“ When the four of these which cannot subsist in the body without the last, abandon their earthly abode, the Jan mingles with the winds, and the Akho returns to heaven with the celestial Rouhs (or spirits) ; because its office being continually to do good, and shun evil, it can have no part in the guilt of the soul, whatever it may be. The Boe, the Rouan, and the Feroher, united together, are the only principles which are

accountable for the deeds of man, and which are accordingly to be examined at the day of judgment. If good predominate, they go to heaven ; if evil, they are despatched to hell. The body is regarded as a mere instrument in the power of the Rouans, and therefore not responsible for its acts. After death, the Akho has a separate existence, as the Feroher had previous to its birth.”

LOCKE.

“ His original ideas are reducible to
Extension,
Solidity,
Mobility, or the power of being moved, which by our senses we receive from body ;
Perceptivity, or the power of perception or thinking ;
Motivity, or the power of moving, which, by reflection, we receive from our minds.
Existence,
Duration,
Number.

KANT.

“ THE MIND.
“ Sense.
“ 2 Receptivities.

Time.		Space.	
“ UNDERSTANDING.			
“ 12 <i>Categories.</i>			
“ QUANTITY.	QUALITY.	RELATION.	MODALITY.
Unity	Reality	Substance and Accident	Possibility
Multitudes	Negation	Cause and Effect	Existence
Totality	Limitation	Action and Re-action	Necessity
“ REASON.			
“ 6. <i>Ideas.</i>			
“ Absolute	Absolute	Absolute	Absolute
Totality.	Limitation.	Substance.	Necessity.
		Absolute	
		Cause.	
		Absolute	
		Concurrence.	
“ INTUITION		“ RESULTS.	IDEA
present in	CONCEPTION	absent in	out of
TIME and SPACE.	TIME and SPACE.	TIME and SPACE.	TIME and SPACE.

“ Kant thus reduces every thing to an *egoism*, of which his own mind was the centre and boundary.

“ The next division is the

UNDERSTANDING.
Quantity,
Quality,
Relation,
Modality,

respectively. Under each of these heads he places three subdivisions ; making thus in the whole twelve, according to Mr. Wigram : but fifteen according to the new complete translation of the Critick of Pure Reason : because to those under Modality we have the opposite set resulting from Negation ; that is to say,

Impossibility,
Non-existence,
Contingence.

“ These twelve (or fifteen) terms are, according to Kant, real divisions of the Understanding, which he took, like sense, to mean a real substratum of perception. They were in his view of his philosophy a sort of original types or standards, which in every thing perceived was referable, and which confer their form upon every object in Nature.

“ REASON,

according to Kant, unites the twelve Categories that exist in the Understanding, and which are themselves *out of Time and Space*, into six ideas, which are absolute ; namely

Totality,
Limitation,
Substance,
He considers Reason as a spontaneity or ac-

Necessity,
Cause,
Concurrence.

tive Faculty, free from Time and Space, in the same way as the Understanding was out of Space.

“SCHELLING.

“I. The absolute, the whole in its primary form (God), manifests himself in,

“II. Nature (the Absolute, according to its secondary forms.)

“It then produces itself in two Relative orders; viz.

The Real, The Ideal,

under the following powers:

Weight—Matter,

Truth—Science,

Light—Movement,

Goodness—Religion,

Organization—Life,

Beauty—Art.

Above, as reflected forms of the Universe, place themselves;

Man (The Microcosm).

The State.

The System of the World (the external Universe). History.”

We have thus given the leading features of the several systems in this synthetical view; but must refer our readers to Sir Graves Haughton's book itself for details, and the very acute analytical remarks he makes upon the refinements of each philosophical theory.

To those in whose opinion the advantages of education for Asia have been checked by the difficulties that have attended it in Hindostan, Dr. Bryce's volume* will be particularly welcome. The efforts of the Native Literary Society of Calcutta, founded only about fifteen years since, have been attended, it seems, with extraordinary success. It seems too, that about a thousand native pupils are now attending the Scottish superior school chiefly to become teachers. The feelings of the more enlightened natives may be gathered from the address presented by them to the society above-mentioned, and which is highly interesting.

“In the days of remote antiquity, the people of *Bharat Varsha*, or Asia, possessed a superiority over all nations in their love of knowledge, and regard for the general good. This region was also the choicest portion of the habitable globe, and the original site of the human race.

“Amongst the tribes of *Bharat Varsha*, those of Hindustan were, above all, valiant, powerful, energetic, merciful, sincere, and wise. Hindustan was the garden of empire, and the treasury of knowledge, and consequently the people were happy, independent, and addicted to honourable practices.

“Owing to various causes, however, the Hindu monarchies were destroyed, and the Hindus lost their learning; became conceited, blind with passion, dark to knowledge, and animated only to selfish considerations. In consequence, they were reduced to the

last degree of dependency and degradation; immersed in an ocean of suffering, and fallen to the lowest stage of insignificance. If we compare them now with other nations in wisdom and civilisation, our regret must be inexpressible.

“But while we are thus situated, owing to our arrogance, to many new and absurd customs that have crept in amongst us, and to our mutual disagreements, we are not the less apt to consider ourselves as happy, superior, and independent; never to think of our condition in its true light, nor to acknowledge it as it is. Consequently, any endeavour to change or improve it is out of the question.

“The chief causes of our depressed situation may, we think, be regarded as the following wants:

“That of social and mutual intercourse.

“Of mutual agreement.

“Of travel.

“Of study of different Shasters.

“Of love of knowledge.

“Of good-will to each other.

“Other causes are especially indolence, insatiable appetite for riches, and the desire of sensual enjoyment.

“Many defects in the constitution of our society are owing to the distinction of Castes, Family, Rank, and Wealth. Those who possess these in a high degree seldom visit other persons, except on occasions of business and emergency; and, on the other hand, they evince little affability towards those who are compelled to seek their presence; the intercourse, therefore, that now exists among ourselves, is confined to the interchange or solicitation of assistance, to the observance of ordinary forms and modes of insincere civility; or, in a word, it springs from motives of self-interest, and never from a feeling of affection or esteem. It is obvious, that as long as no one feels an interest in the good of others, or is actuated by any but motives of self-interest, agreement or concurrence in opinion on any subject cannot be expected; the truth remains unknown, the parties being incapable of correcting their mutual errors.”—pp. 65-67.

We give a few lines upon the Jaina system. This remarkable race, whose anti-

* A Sketch of Native Education in India, under the superintendence of the Church of Scotland; with Remarks on the Hindoos, and their Conversion to Christianity. By James Bryce, D. D. London and Edinburgh. 1839.

quity is unquestionable, and whose existence nevertheless is only now becoming popularly known in Great Britain, and principally from the works of the Rev. W. Taylor,* Col. Tod, and Mrs. Postans, deserve, we think, the closest possible investigation from scholars. Their depression is notorious, their antiquity confessed, their candour manifest, and their love of learning evident from their scrupulous preservation of all records and papers, which the Brahmins as sedulously destroy. The library of Anhulwarra, therefore, discovered by Col. Tod, (see our last number, p. 80, Art. Arabian Nights,) would probably furnish the desiderata of ancient Indian history.

"The source and root of the mythology now popular in Hindostan, is a principle of pure and simple Deism; the sect of the Jainas contains stronger traces of this original character, both in their worship and their creed, than the Bramanas. The Jainas were once a powerful people, and are now humbled and dispersed; and it is contrary to the evidence of things in other continents, that ruin and dispersion should be taken as signs of recent origin, and present prosperity as a proof of greater antiquity."—pp. 364, 365.

The following anecdotes must conclude our extracts from this volume.

"In the thirty-fifth year of Akber's reign, it was said of Sheikh Kamal Biahani, that he was endowed with the miraculous power of transporting himself instantly to a distance, so that a person who had taken leave of him on one side of the river would, upon crossing to the other, be again saluted by his voice. Akber went to see him, and begged him to communicate his skill, offering in exchange for it his whole kingdom. The Sheikh refused to instruct him. On this Akber ordered him to be bound hand and foot, and threatened to have him tossed into the river, where, if he possessed the faculty to which he pretended, he would suffer no injury; and if he was an impostor, he would be punished deservedly for his fraud. This menace alarmed the Sheikh; he confessed the whole to be a trick, practised in confederacy with his son, who was covertly stationed on the opposite side of the stream, and counterfeited his father's voice."—p. 362.

"It is now very generally acknowledged, that since Europeans began to open to the Hindu the sources of wealth and enjoyment, the trammels of caste have been observed to bear but lightly upon him; and it is felt by all who have an opportunity of judging of

the native character, that what has been so long and generally regarded as interwoven with all his feelings and prejudices, has been, to a great extent, an excrescence upon his habits, generated by the combined influence of political depression, and cunning and selfish superstition. When the influence of these has been counteracted by a happier state of things, the natural feelings and propensities of mankind have easily triumphed over *Caste*. The highest Brahmin now mingles in an intercourse with the *Feringhees*, which, less than half a century ago, would have been regarded with horror and dismay, as entailing the most indelible contamination, or subjecting to the most intolerable purifications and penances. The public assemblies, on occasions of complimentary festivity at the mansion of the Governor General, are now frequented by crowds of native gentlemen, happy to participate in the honour of an invitation; and it need scarcely be added, that what finds countenance at court, meets with abundance of imitators in the ranks of private fashion. To the houses of the wealthy Hindu, the European is now finding a reciprocally easy access; and the writer of these remarks has himself partaken in the hospitality of natives of high rank and caste, where even the sacred cow has been served up to gratify the tastes of the European guests."—pp. 170, 171.

ART. VI.—*Whist, par M. Deschappelles*.
(A Treatise on Whist, by M. Deschappelles. Second Part.—The Laws. London.) 1839.

EUREKA!—Our readers will recollect the cry of Archimedes, when quitting the bath in the pristine simplicity of his nature, he rushed through Syracuse with considerably more of philosophy than garments, to establish the truth which he had discovered at the bottom of his tub. With similar eagerness, but somewhat more of etiquette, inasmuch as the new Police Act has come into activity, we present ourselves before our readers in a sheet or half sheet, whichever offers, to establish the difference between purity and alloy; not indeed of crowns or of gold, but of that which brings in both to its noblest votaries; and which, when three or four of them are gathered together, is ever to be found in the midst.

It is indeed of that mysterious influence which inspires even the dull, and hushes the eloquent; that checks the flow of conversation, wrinkles the brow of beauty before its time, bids science pause in its career, supersedes learning, and relieves avarice of its load; that stoppers the decanter, and va-

* See Foreign Quarterly Review, No. 37, Art. Tamil Historical MSS. We are happy to see continued notices of the progress of discovery in these, by the labours of Mr. W. Taylor, in the valuable Nos. of the Madras Journal of Literature and Science, a singularly interesting quarterly publication.

cates the piano; draws the glass of toast and water from the willing hand of temperance, opens the miser's purse, unites strangers in the sacred bond of brotherhood and rubbers, and separates, alas! even conjugality, by an impassable baize or velvet of 3 feet 4 inches:—it is of this influence we are now to treat.

Whist!—the very name is mystery—the sound is mystery—the etymology also is mystery. Who knows whence it came? and who can tell what it is, or where it is going? Readers whose aspirations refer to the mighty past, recall Hoyle, and General Scott, and Matthews:

“But where repose the all-Etruscan three?”

as Byron himself has asked, in vain. Hoyle eludes the explorers of antiquity through every book-stall; Scott has become obsolete; Matthews himself, though twice reprinted, is no more. *Stat nominis umbra!* for the three names form but one shade that darkens over the past—a shade silent and voiceless as that of Ajax in the same place, when the snow-falling eloquence of Ulysses could not win him over, even to shake hands.

We do not exactly know how often the spirit of whist has assumed a human form for the express benefit of Europe; but we are strongly inclined to conclude that M. Deschappelles is the identical White Horse so long expected in India, as the tenth point, or incarnation, of Brama; and who is to dispose of Knaves, and Kings and Queens, according to his pleasure, give rules for the doubtful cards, and play the deuce with his adversaries; these may sit and lose in silence, or play on to the last stake “in murmuring wrath,” as Campbell so long since poetically foresaw of them in the Pleasures of Hope.

It is idle to recall the past with its first hey-day dreams and fascinations; though even then unconscious childhood boasted its little all of skill, and youth deemed itself matured;—*Eheu, nesciens futuri!* That fancied manhood of Whist was most truly prematured, and now reads its own errors in the wisdom of Deschappelles. Genius ennobles and controls everything. Cookery bowed her haughty head before Ude, “and thanked him for a throne,” the throne which he proudly raised for her and himself in the loftiest altitudes of the human stomach; and what shall Whist and whist-players refuse to Deschappelles, who has made everything in art and nature, and a great deal that is in neither, subservient to her power?

We have indeed but a portion of the immortal performance before us; a feather at a time from the wing of the French Gabriel;

and certainly it would be no ordinary mind that could comprehend the whole of such a revelation at once. Mahomet and Deschappelles alone, received, as they assure us, the mighty secret in a few moments; and both of these were men, and with men's intellect; though mens divinior; especially chosen vessels for the great tasks they had to perform.

M. Deschappelles's present work is epic, for it begins in the middle, or at the fifth chapter, and in a high heroic strain. The Muse, it is true, is not invoked as by other bards; but as the work is written in the plural, it follows that she formed a junction with the author before he commenced operations; and this proves him to be an able tactician, like Soult and Wellington. Who indeed would sit down to Whist by himself? The invocation consequently is, for want of a better object, addressed to the reader in shape of a preface, Sublime, Moral, and Philosophical, as the Homeric Poems, and nearly trenching on the same subject—namely, the woes of the Greeks.

“This volume contains the Rules of the Game of Whist; it forms but one part of our treatise on the game, and we publish it separately, in compliance with the earnest request of our friends, and the wishes of the public. Though wholly uninfluenced by a desire either of fame or of profit, we may yet find a sufficiently powerful motive for action in the ambition of pleasing or being useful to others.

“In order that a law may be efficacious, it must be aided by two conditions: firstly, it must be understood, and secondly, it must be obeyed. The first of these conditions is attained by those definitions which point out its exact extent and limits; and the second, by that reasoning, which, by confuting objections, and by distinctly explaining its principles, ensures the universal application of the law.

“The old law of Whist, which united the two conditions in each of its articles, was extremely intricate and perplexed, and was in itself so defective, as to be totally inadequate to supply the wants of society.

“We have found it necessary to divide our work into two chapters; one consisting of the rules to be observed, and the other containing our remarks upon the rules. The former of these chapters is the more essential. As it is continually required for reference in cases of dispute, it should be well studied, and almost committed to memory. The latter may be perused more leisurely, as its spirit only is necessary to be retained.

“Thus, Chapter V. contains the text; that is the essential part, and Chapter VI. the commentaries. These two chapters are, however, inseparable from each other, and together form a complete work.

"Chapter V. is the result of twenty years' observation and progressive improvements. Here we are far from flattering ourselves that we have attained perfection. If we were to abstain from giving our work to the public, till we had made ourselves satisfied on that head, there would be no end to the delay. Something we have accomplished, by having laid down, in compliance with the wishes of amateurs, not an indigested and desultory production, but a rational, and almost complete code of rules; and by having thus prepared the way for future emendations and improvements.

"Chapter VI. is wholly explanatory, and merely a development of all the ideas contained in the former chapter; it is a long conversation, explaining a concise and peremptory law, which, without this illustration, would have frequently been unintelligible. For this latter chapter we claim the indulgence of our readers; it has been hastily written, in order that no delay should take place in the publication of the former chapter, to which it serves as a key. Here, from the nature of the subject, no elevation of style must be expected" (! !)

It is probably owing to the absence of the four first chapters of the work that various points of material consequence, to some of which we shall allude in their places, do not appear. From the precision of M. Deschappelles in all that he undertakes, and which is *ab ovo*, we are inclined to rely upon it that the first chapter of his work will contain the etymon of the name, Whist; but as this unfortunately is not before us, we shall ourselves attempt its etymology from our own researches, and leave the learned to decide.

The first and most obvious etymon of Whist, is the English phrase, What is it? of which it may fairly be deemed a contraction: for persons not knowing the game would naturally first and primarily use this form of inquiry respecting it, and the more generally if brought from abroad: hence it would form the root, and would thus by corruption become the derivative.

Another root, equally probable, is the old English verb Wist, as, knowing: signifying the skill required: and we lean to it the rather, as it especially implies a degree of uncertainty, such as attends the game even with the most experienced players. It is a perfect term, a complete description, a sentence in a word; expressing one chief requisite in the player, and intimating the distinctive attribute of the game. It is a picture-thought.

It may be that Whist is simply the word Hist, with the Eolic digamma before it, as commonly found in our academies, halls, and kitchens: and as the Latins and Etrus-

cans confounded *f*, and *v*, the word *Fist* may be of the same family; for *Hist* enforces silence, and so does *Fist* very often. It is, however, by no means clear that *Hist* in the present case signifies, Be silent; we often find whist quite the reverse. *Hist* may be only a contraction of *History*, which arranges the order of kings, queens, and their inferiors, and treats of their struggles and fortunes. The digamma is of equal service in both cases.

Perhaps, however, the English origin of the appellation is simply the verb, *Wished*, as signifying a desideratum; and thus turned into a substantive in the origin of language: or it may be from *Wish* it, used interrogatively. Do you wish it? Do you Whist? like, Do you tea? and, by periphrasis, Don't you wish you may get it?

Allied to this last in sound and sense is the English, *Visit*. People constantly visit each other to play a rubber, and cockneys especially: quasi *Wisit*. The substitution of *w*, for *v*, is common, as a digammic form, in the city of London, as in other Eastern lands. Provincialisms are not, as is generally imagined, modern home corruptions; but old and foreign dialectical varieties. We ourselves do not, however, insist that *Visit* and *Whist* are precisely the same word.

Then there is the Italian word, *Vista*, a view or perspective; figuratively, foresight, circumspection; actually, casting an eye; as over your neighbours' lands, or hands, the thing most useful in Whist. We prefer this etymon to the Latin *Vesta*, whence vestal, secluded, not to be profaned: a reading supported by the high authorities of the Police.

The Irish injunction *Whisht*, be quiet—may be thought to require consideration. It is the exact form of the word, barring only the pure *s*, but this is not the sibboleth, or touch-stone, here. At the utmost the difficulty is but a dialectical variety, *elegantiae causâ*, for the sake of elegance; just as *shoup* for soup.

Some would derive it from the German, *Wissen*, to know, in relation to abstractions: the object and tendency of Whist being to abstract the thoughts, and the money. It is further worthy of notice that this word rhymes to *Listen*, in English; which proves its adaptation to purposes of silence, even in a foreign land.

We would finally suggest that the word is Indian. *Vishen* or *Vishnou* being there the object of devotion, as Whist is here; and for the same reason; something is to be got by it. In a religious view it strengthens the hint we have previously thrown out of an

expected avatar or incarnation in Hindostan: and in the same sense, and analogically, it is confirmed by the name of the other deity, Seeva or Seev; clearly the English Sieve, which so finely and allegorically marks the circumplectent and discriminative power of this last deity. Another argument, and of even greater force, is, that since the Irish or Celtic is an eastern language, the Hindoo Vishnou seems to be the Irish Whisht now, be quiet, can't ye? * Celtic, without digamma, Esth na dioul; Be quiet, ye divil.—An analogy we earnestly recommend to the notice of Professor Schlegel.

We have gone at some length into this laborious investigation from a strict sense of duty to the reader, and from which nothing shall induce us to turn. We now resume our notice of M. Deschappelles' performance: it begins thus.

" RULES OF WHIST.

" Chapter V.—Section I.—Of Preliminary Arrangements.

"ART. 1.—A complete Whist Table is composed of six persons. The first four are chosen by lot, (see Article 6,) for the first rubber, and the two others take their turn for the succeeding ones.

"ART. 2.—If the table be not complete, new players take their turn in order of their arrival; and afterwards fill up, in their turn, whatever vacancies may occur.—(See Article 13.)

"ART. 3.—If more than six persons present themselves to form a table, the four first players are chosen by lot.—(See Article 7.)

"ART. 4.—Every one is entitled to play two rubbers, after which he must quit the table, to make room for those whose turn it is to replace him; the two players who are to leave at the expiration of the first, or opening rubber, are fixed by lot.

"ART. 5.—When the rubber is finished, if there are parties waiting to play, a table is compelled to admit two of them, but never three.

"ART. 6.—The lot is decided by a single pack of cards, each party drawing one.

"ART. 7.—It may be necessary to draw lots twice, before a table is completely made up.

"Firstly, to decide on the six persons of whom it is to be composed, and on the four who are to commence.

"And, secondly, to determine the choice of partners."

Our readers will perceive how carefully the author commences with preliminaries,

even though these are rather the regulations and observances of clubs and society in general, than absolute rules of Whist, emanating from its own essence. With so much of exactitude we are greatly surprised to find that the most essential of preliminary arrangements, that of getting the cards, is totally overlooked. "If," said Zadig, "there are no griffins, we cannot eat them." Cards are by no means mathematical axioms, and undeniable; and if they were, we must, according to the authority cited, have them before we can use them. How, therefore, M. Deschappelles could take them for granted, as he evidently does, would require a Critique of Pure Reason to discover.

We must conclude, and hope that this important consideration is fully discussed in all its bearings in the fourth or previous chapter to that with which this volume commences. We must not suspect the author of committing so great an oversight as to omit it altogether, particularly with the example of Mrs. Glasse before his eyes. In her illustrations of the art cuisinatoire, as it is termed by the Society for the Diffusion of Useful Knowledge, but almost as well known as her Cookery Book, this provident writer expressly insists that a hare should be caught before any further modifications of its entity are permissible, or its monads divisible ad infinitum in a stew, according to Leibnitz. Locke himself must have admitted this into his logical system; we cannot be quite sure of Condillac, but neither Hobbes nor Malebranche have objected to it, we believe. Nay so fully was the authoress in question (i. e. Dr. Hunter) impressed with the various means of providing for a family, that on another occasion, she does not, to her immortal fame, hesitate to recommend her pupils, with an honest eye to domestic economy, to *bone* a goose; advice most interesting in its practical appliance to mechanics' institutions, tailors' boards, and larders, particularly at this season of the year.

Whist is the modern Law of Nations. The Moldavian Harp, newspaper, has been recently suppressed in its native land for speaking irreverently of the Russian minister's propensity for Whist! We tremble for Lord Granville's embassy; yet as we hold cards, with the first diplomatists, to be the *sine qua non* of Whist, we earnestly beseech M. Deschappelles not to arrange his future treatise on the basis of the *uti possidetis*. "Whether you have them or not," is no indifferent matter, to those who cultivate the art of Whist, upon Cicero's recommendation, as improving their natures, and springing from Philosophy—

* See also Die Celtischen Sprachen in ihrem Verhältnisse zum Sanscrit, Zend, Griechischen, Lateinischen, Germanischen, Litthauischen, und Slawischen. Von Franz Bopp. Berlin, 1839. 4to. p. 89.

"Philosophia vero omnium mater artium."

"Plato calls it a GIFT; I, an INVENTION OF THE GODS," proceeds that great judge and orator.* The candid opinion of Demosthenes on the subject we never could obtain, not having been much at his soirées; but we have repeatedly noticed that he never spoke against them, even in his Philippics: why, therefore, he should have made a mystery of the matter, we cannot, for the life of us, imagine.

Such neglect, then, is the source of grievous bitterness, in the provision of cards, as of hares;

"—— de fonte LEPORUM,"

observes Lucretius expressly of the latter; but, with bowels deeply moved by translating our apophthegm into Latin heroics, he adds,

"Surgit amari aliquid,"

that is, PLAY OR PAY;—so at least the commentators at Tattersal's understand it:

"—— quod ipsis in floribus angat."

Anglice, which is a great nuisance at the clubs. Some, by the way, may insist that by "floribus" is intended "on the turf;" but we hold it clearly a poetic denomination of the trefoil,—Cleoben, Saxon, to divide, whence comes Club.

It has been suggested, however, by passages of the *Vis inertiae*, (i. e. Whist) of Des Cartes, on which we regret we cannot lay our hand at the moment, that the suit of clubs marking the trefoil, or Irish trinity of St. Patrick, and being invariably used in its plural form, exactly corresponds with the word "floribus;" which must, therefore, in this place, and by hypallage, be taken for cards; so that the reading would signify

"Which is a nuisance arising from the cards."

But M. Deschappelles has not provided them, as we see: and to have cards is not to be without them; and if we substitute, as recommended, sine for "ipsis," still what are we to do with "in," which also the full measure or metre requires. An inn is a house of entertainment; the Inn preceded the Clubs, as the text of the poet evidently shows: so that highly as we respect the Greeks, and at cards especially, we must in this case appeal from their decision to the Jockey Club, until when we need not pursue the subject.

* Such too was the constant maxim of the departed great:—we allude to William Soames, Esq. Emeritus Professor of Barrington College, Botany Bay.

In furtherance, however, of our Irish theory, we beg to observe that floribus at Donnybrook always signifies, with flourishes—i. e. with clubs—a remarkable coincidence of the Celtic with the Saxon philologists, as the learned secretary of the Society of the Camden Head so happily insists.

If the fourth chapter of M. Deschappelles' work contains the inquiry alluded to, and we hope it does, as we are seriously interested for his character; the third must necessarily turn on the source from which cards were obtained. This, we are persuaded, is no hasty and ill-advised conjecture on our part.

Nevertheless, as our readers have not this portion, we must throw out a few remarks on the subject.

It is generally believed that cards were invented for the amusement of a King of France; and that the peculiar costume of the period is preserved in the court-cards at present in use. How this may be we know not; but we suspect notwithstanding that a deeper research into the Cartesian system would have traced deeper the source of this, as of the philosophy of the Stoics, exhibited by Manilius. We would submit it may be said that both came originally from the East. The necessary union of Whist and Stoicism strongly favours this presumption; but we would fain support our opinion as to cards by a few facts apparently unknown to European lovers of the art.

Were the studious to examine with care the royal images of Kandian kings and queens in the rooms of the Asiatic Society in Grafton Street, they would perceive that the painted habiliments of the sovereigns of cards bear the strongest possible resemblance, short of absolute identity, with the dress of the sovereigns of Ceylon. There is, however, one point to which we must especially call the reader's attention: the poet's

Four hoary kings, in majesty revered,
With curling whiskers and a forked beard,

find at all points their sufficient prototypes in the lords of Kandi; but this is not quite the case with their lovely partners; for the

—— four fair queens whose hands sustain a flower;
The expressive emblem of their softer power;—

hold, in the Kandian originals—so we may be allowed to call them—an even more "expressive emblem," and still more mischievously insinuating "of their softer power;"—to wit, a FAN, a circular fan; such as is used actually in the East to close a man's eyes, and lull his senses into slumber; and which, for aught we know, may be "a

type, and a metaphor, and a parable," for similar doings elsewhere. We would fain say nothing about the management of fans in Spain. In Europe generally the change is happy, from fans to flowers; though it appears to ourselves insidious, thus placed; for obviously they are but the moralist's

"Flowers—whose wild odours breathe but agonies."

and suspicious intimations like this are libels against the amiable sex—who never reap sorrow from cards.

Farther, in India, the cradle of wisdom, as it claims to be from the earliest ages—and it certainly is little more now, and the brat is still ricketty—we know that the Tamuli have had cards from time immemorial; and they are said to be of equal antiquity with the Brahmins, who unquestionably possess them still, and claim to have invented them. Now the word Brahmin is synonymous with Div, as every scholar will admit; and as none can deny that Deorum is but another form of Divorum, it follows that the assertion of a Brahmin or Div origination is borne out by the authority of Cicero, in a passage already quoted, where he expressly observes that every art is "*inventum Deorum*;"—i. e. an invention of the Brahmins.

This opinion seems strengthened by the reference already made to the white horse of the tenth Avatar, as expected by the Brahmins. We know too that the white horse is the crest of some Teutonic races, as in Hanover, for instance—to say nothing of Kent and Horsa—and that the Germans trace, with Von Hammer and others, their origin from the East. This coincidence would satisfactorily explain why the Germans to this day, and in Hanover especially, hold the tenth card as an honour;—clearly in reference to the tenth Avatar; and it is further remarkable that everywhere the tenth point, like that tenth Avatar, closes the game. In the same spirit we do not hesitate to affirm that the Four Suits are but the four castes of the East:

The Diamonds mark the SAGES, who introduced mining and gems.

The Spades, the SOLDIERS—Sipayah; or Sipar-dar, shield-bearers. (Spanish—Espadas, swords.)

The Clubs, or flowers, the AGRICULTURISTS.

The Hearts, the DOMESTIC race—quasi, of the *heart(h)*.

Further, the time for playing, namely by lamp or candle-light,—evidently sun and stars—is a mystic type of the Sabæan idolatry and the worship of fire; which proves

the remote antiquity of card-playing. The very name of the lamp-inventor, Argand, being obviously but a corruption of Arkenk, or Arganj, the fire-breathing Div, of Oriental historians,* Ur-kand, having-Fire.

After this concise but indispensable digression, we return to Europe and M. Deschappelles.

Having duly prepared the reader for the revelations of this volume, it is not to be supposed that we would seek idly and presumptuously to raise the mystic veil that shrouds the sanctuary of science from the vulgar eye of devotees; nor that we would attempt to embrace within our narrow space and comprehension the range of its sway; nor speak lightly and irreverently of such a mystery. All we can do for the reader is to direct him to the fountain-head itself, by bringing before him a few snatches of the doctrines promulgated, accompanied with such reverential commentary as shall duly impress, without overwhelming, his bewildered senses with the importance of the awful theme.

We have already established, both by analysis and synthesis, that cards must be obtained in order to play Whist. For the advantage of clubs and their members, of pri-

* While this article was in press we have been favoured with a sight of two packs of cards in the possession of the Royal Asiatic Society: and, as Truth is more strange than Fiction, one of these, consisting of TEN suits, certainly does represent the TEN avatars or incarnations of the VISTNOU, or Vishnava, sect; as was well observed by that various, acute, accurate, and sagacious scholar, Mr. Norris, the acting librarian. They are, like the others, of circular form, painted on different coloured grounds, and highly varnished and illuminated. Each suit is of ten, and two court cards,—the rider of a horse or an elephant respectively—and the pack consequently is composed of 120 cards. The suits are—

- | | |
|------------------|---------------------------|
| 1. The Fish. | 6. The Hatchet. |
| 2. The Tortoise. | 7. The Umbrella (or Bow.) |
| 3. The Boar. | 8. The Goat. |
| 4. The Lion. | 9. The Boodh. |
| 5. The Monkey. | 10. The Horse. |

It will be seen that these are exactly the incarnations referred to above; but,—as was justly remarked by the intelligent scholar who pointed out the coincidence,—the Dwarf of the 5th Avatar is substituted by the Monkey; the Bow and Arrows of the 7th, by the Cattashal, or Umbrella, which gives precisely the same outline; and the Goat there, as often elsewhere, takes the place of the Plough. These cards then are clearly MYTHICAL.

The other pack has eight suits, of eight cards and two court cards each; eighty in all. The Parallelogram, Sword, Flower, and Vase, answer to the carreau, espada, club, and copa, of European suits; the barrel (?) the garland (?) and two kinds of chakra (quoit) complete the set. Five of the suits are white, and three red: TYPICAL of the Sage and Soldier races. The Divs were of BOTH.

We shall return seriously to this subject shortly, as the facts fully bear out the suspicions.

vate parties, of visitors of hells, and all such unsuspecting novices at cards, we lay down, by the authority of Deschappelles himself, the novel and daring but nevertheless unquestionable general proposition, that Whist requires four players. This fact, though not, it must be confessed, positively asserted by the great legislator of the game, is certainly the direct inference, indeed the absolute corollary from the four following passages :

"A complete Whist table is composed of six persons.

"The first four are chosen by lot."—Art. I. ch. v. p. 1.

"The four first players are chosen by lot."—Art. 3.

"The four persons comprising the first rubber."—Art. 14.

In the nineteen articles comprising the next (6th) chapter we find the statement confirmed, and a further point, as to the *modus operandi*, established on a fundamental basis.

"Four persons are seated at the table and the game is arranged."

This precept is invaluable.

We are inclined, however, to question the universality of the next proposition.

"Two are prepared to take their seats, with the same rights and privileges."

This seems to us the beau-ideal of play, but we fear it is often confined to Utopia : for there are persons existing, in England at least, and persons of veracity not hitherto questioned, who can depose to cases of Whist where only four persons have been present the whole evening ; and the other two, whatever might be their own progress in preparation, or the process that was to bring them within the range of Elective Affinity, have certainly not been prepared, to the eye of flesh at least, to take their seats. But the writer and "poet's eye, in a fine frenzy rolling," discovers

"Such are the resources of the Game of Whist as it has been established. Such is its life, its movement, and its pleasures. If to these be added the social interests alluded to in Chapter I., that ardour for the game which renders us indifferent to the person of the party filling the first vacancy at the table, provided he plays ; and who, in the midst of hopes and dangers incident to all, makes us forget all misplaced prejudice, we shall be compelled to admit that this game has been invented for the delight of man, since it affords him a no less useful than agreeable pastime."—pp. 40, 41.

On the awful consequences attendant on a simple *quatrain*, such as we have hinted at above, he with unaffected pathos exclaims,—

"Remove the parties who stand ready to take their turn, play with closed doors, and the charm is destroyed, it becomes then but a common-place game. Egoists ! pause ! if you have yet one shadow of intelligence remaining ! it is your own happiness you are about to destroy !" —p. 41.

"——— Quis, talia fando,
Myrmidonum, Dolopumve, aut duri miles Ulyssei
Temperet a lachrymis."*

As the pious Eneas well observed in such extremity.

Other and older games, the "*mala majorum*," are justly denounced with dignified indignation :

"Some of them were anything but an acquisition to society : only conceive, for instance, two rows of gentlemen seated apart from the ladies, intercepting the light and air ; a game diametrically opposed to every social comfort ; at which no one individual could feel at his ease, and where every player sat in continual discord with his adversaries." —p. 56.

Whist, like mathematics, is an exact science, and here is one of its axioms :

"A cut must be at least to the depth of four cards, the number composing a trick."

This, we conclude is the "cut direct ;" less would savour of indirectness ; for "there are still other modes of cutting ;" and

"If only one card were cut, it might be suspected that it had been seen."

And the writer's predilection for jurisprudence is developed in the following remark, which we recommend to the attendant and revising barristers of Common Pleas :

"Equity is frequently concealed under a mass of legal forms, and may be easily perverted when obscured by technicalities ; but when once discovered and brought to light, it is immediately acknowledged by all parties : objections become ridiculous, and former errors are entirely obliterated." —pp. 64, 65.

The following remarks of our great moralist on the system of dealing with mankind must deeply affect all General Dealers, even to chandlers' shops :

* What Myrmidon, Dolopian, what soldier
Of stern Ulysses, tell such tales without a tear ?
Our scansion, *sub virgâ* (BIRCH), is from a recent translation of Faust.

"It is singular enough that the plan of dealing out an entire pack of cards one by one, should have been ever adopted. It is sometimes a great fatigue, and one which has been imposed on a class of persons who would willingly dispense with it, as we show by our observations on the deal. This plan, to say the truth, possesses no advantage, it even exposes the cards to be seen, on account of their being singly separated; not that we should advise any change in this mode; very far from it; we should thus raise ourselves a host of enemies; for it is a universally received practice, and looked upon as a prototype. There are even many fanatics who, rather than admit any reform in this plan, would altogether renounce the game; who would sooner destroy the idol than suffer the slightest innovation or change in the ceremonial of its worship."—p. 80.

"Is there ever a chandler here?—Because Old Daniel Dowlas (Deschappelles) axes his applause."

But the Lycurgus of Whist, as Johnson observed, "is sometimes pathetic, and sometimes sublime:"

"We cannot help cherishing the belief, that there is a sentiment of mystery attached to this mode of dealing, a sort of religious obligation, which, in order that the cards may be received in safety, and with respect, prompts us to deliver them from the hand slowly and majestically."—p. 80.

We are told, and if the inuendo is meant politically, Conservatives as we are, we cannot deny that it would be the greatest possible improvement in the Reform Act,—that

"The game of Whist might dispense with the trump; it would be a noble game even without it; but since it has been once admitted, it has rapidly advanced its pretensions; and from being a mere auxiliary, has become at length a despotic ruler. Thus we see what force and *éclat* will accomplish. We disapprove of everything in the shape of usurpation, but we cannot help recognising the power of the trump; and in making the above remarks upon that card, we have no intention of raising either doubt or suspicion of its legitimacy."—pp. 81, 82.

We own, and with tears, that the nomination of a trump is a part of the old Rotten Borough system; and should appear in Schedule A. with Gatton, Sarum, Port Wine, and everything not truly Whig. How much superior would be an Universal Suffrage, by which each player, and each expectant also, should name the trump-suit of his own heart at every deal. In one section of the Reform Club at least we should hope to see the operation facilitated by the Ballot system: and if

this election were made at every fresh lead, instead of every deal,—as with the borough-mongering faction devised by "le monstre Pitt, ennemi du genre humain," for the enslavement of mankind,—it would assimilate the more to Annual Parliaments; and then how would the Peels and Wellingtons shrink from the face of day!

The following adds a chapter, we trust, to that first volume of Moral Philosophy which is received at our universities and schools:

"There is a certain time when the prosecution of a crime, of however enormous a nature, causes tumult and confusion. 'Why have you not taken care that the cards were properly placed?' or 'why have you suffered them to be taken from your left? You are an accomplice in an act which tends to your own injury; for you had but to use your eyes, in order to avoid this error.' To this observation we received the following answer. 'I was engaged in a dispute about the last round.'—'Will not this teach you that disputes are always useless, and that they become prejudicial to your interest when they draw your attention from affairs of greater importance? Another time you will act more prudently.'

"Having said thus much, he finished by making, under the semblance of confidence, a confession which, we own, filled us with astonishment. 'I knew,' said he, 'that it was my deal, and it was from mere indifference that I allowed it to be taken from me. This discussion, in which you have made me figure so prominently, I originated, solely in order to furnish myself with an excuse, in the doubt under which I laboured, for ascertaining whether my action was permitted or not.'—pp. 82, 83.

"We conclude these remarks with the following observations:—A player has a right, if he choose, to allow his deal to be taken from him; but never, designedly, to take that of others."—p. 84.

A hint for a new nomenclature is thus given:

"To *phase* is to change. We will not swear that this word did not come to us from the moon."—p. 84.

As changing seats is no unwonted practice, would it not be singularly appropriate to speak of each player, not by his name, but his relative position at the table? such as, the beau in the third phase; the dowager in the fourth phase! This delicate allusion to change of place, or principles, might surely be extended to other than club-houses with advantage.

There is a closeness of argument united with a profundity of research in the following passage, that prepares the reader to re-

ceive implicitly the astounding novelty of the conclusion :

"An English dictionary has defined a rubber to be 'a game, revenge, and the whole.' To say the least of it, this is a truly singular definition; it is incomprehensible to us, and we should even say that it is the definition of a person who has never made one at a whist table. This, however, does not astonish us; it is of a piece with what we witness every day, and in every species of business. It is a great chance that a work is confided to one specially devoted to it. This reminds us that in the edition of 1788, of the Dictionary of the French Academy, the definition of the word 'beefsteak,' is laid down as 'A mutton chop broiled on a grid-iron;' and it is still fresh in the recollection of the public, that an exclusive but ruinous railroad undertaking has been recently confided to the management of an individual known only as a man of wit and agreeable manners in society.

"The rubber is the winning of two games out of three; every nation in which the game is played understands the term in this sense. When one game has been won on each side, a third is required to decide the rubber; if, on the contrary, the two games have been won by the same side, the rubber is finished, and a fresh one is commenced.

"This then is what is expressed by the word rubber. Nevertheless, it would seem to imply something more, otherwise we should not have introduced the word into our language, which is repugnant to the admission of synonymous terms, and which requires a rigorous reform in many of those words which it has admitted."—pp. 105, 106.

These remarks, so entirely homogeneous, and in such perfect accord and harmony, are wound into the following grand diapason, that bursts suddenly, in novelty, on the unexpected ear.

"A RUBBER MEANS TWO OUT OF THREE CONSECUTIVE GAMES."—Is it possible!

The more analytico-synthetical style of observation proceeds :

"The genius of the English would bestow on every game an existence peculiar to itself—an *identity* which would make it a distinct being, possessing faculties, and the power of developing them; one which should enjoy the privilege of its *habeas corpus*, duly classed under its proper standard, according to its importance, but always easily recognized. So much for invention. In any other country it would require an effort of the imagination to discover that which in England has been determined by a natural, but gradually improved law, which secures to every man his own sphere of action, which is averse to one individual becoming the slave of another, and which, in the exercise of freedom of opinion, extends its protection even to the brute creation.

"Ye learned compilers, who would persuade us that whist was invented by the Turks, how little are ye acquainted with the principles of the game, who would ascribe its invention to a nation of slaves!"

While the reader is recovering from the prostration of faculties induced by this Sal-monean thunder, we take the opportunity of turning over sixty pages at once, for our space warns us to be sparing, and of entreating his slow-reviving intellect to learn wisdom from the remarks we ourselves make in passing, if he has his own improvement at heart.

Whist we have classed with mathematics as an *exact* science: and the proof of it is, that it always *exacts* three tricks for a revoke. Upon this act—this sin—this crime against the first principles that bind man to society in the first ages of the world; and that threatens to rupture every link in the great chain of order, that reaches, as M. Cousin has well defined it, "upwards from human nature to the angel, and in a descending scale connects him with the brute,"—as is the case with blind beggars and their dogs:—upon this act, disorganizing and consequently demoralizing the world at large, M. Deschappelles is properly and unusually severe, destroying, as it does, what he calls the Golden Age of Whist. He devotes not less than thirty pages to the subject in one place (pp. 165 to 196), and three in another (OF THE REVOKE INSOLIDAIRE: where both parties are not responsible.) We abstain from going at length into the former point, inasmuch as it will of necessity hereafter be incorporated into the Statutes at Large; but of the latter we must say a few words.

Hints are repeatedly thrown out in the work as to making the one offending party pay the penalty for himself and his partner also—in coin. Now as a revoke not unfrequently arises from a player being in jeopardy for the stake, knowing it is the last in his pocket, how, we would ask, when he has not enough for himself, can he be made to pay his partner's share also? The point seems to involve a difficulty, and is apparently deserving of consideration.

Meantime, let us observe that a revoke, like Fate, is a necessity: such as the Greek tragedy admitted and inculcated, and Lucretius contended for. Virgil has spoken unreservedly on the very point in question; for he says,

Revocare gradum, hic labor, hoc opus est.

in his own elegant language—

Revoking—that's the job—what must be done.

And M. Deschappelles has evidently recognized the principle in his summing up:—

“To conclude—‘Necessity has no law,’ Infinity of space and time are far beyond human comprehension; but we are nevertheless forced to believe in them, because the contrary would be absurd.”

M. Deschappelles, however, has not explained whether he recognizes the revoke as a moral or a physical necessity. We consider it both. It is moral, because it saves your own money and pockets your adversary's. This requires no demonstration. And the physical it will easily become, as the following considerations show. We consider the punishment should be graduated.

The party revoking should undoubtedly pay the penalty for his partner; but, as money is out of the question, it should be by being condemned to play out the game of PATIENCE, till he has capped all the four suits, under the eye of the partner he has injured and the two adversaries he has wronged, and whose feelings must be hereby fully gratified. A second offence, however, can admit no palliation; he should then be compelled to pay; or if he really cannot, he ought to commute by—at once, before he goes on with the game, and with the least delay possible—being thrown out of the window; previously pledging himself, however, in return for this indulgence, to come up and conclude the rubber before he attempts to get his bones set.

The justly high reputation of Deschappelles precludes further commendation from us.

ART. VII.—1. *Urgata Esaias Nabi. Ascensio Isaia Vatis, opusculum pseudepigraphum, multis abhinc seculis, ut videtur, deperditum, nunc autem apud Æthiopes compertum, et cum Versione Latina Anglicanaque: a Ricardo Laurence, LL.D. Heb. Ling. Prof. Reg. (The Ascension of the Prophet Isaiah; a work attributed to himself; for many centuries lost, but at length discovered in Abyssinia.) Oxoniæ, 1819.*

3. *Metsehaf Enoch Nabi. (The Book of Enoch the Prophet, an Apocryphal pro-*

duction, supposed for ages to have been lost, but discovered at the close of the last century in Abyssinia. Now first translated from an Ethiopian MS. in the Bodleian Library. By Richard Laurence, D.D., Archbishop of Cashel. Oxford, 1838.

THERE is nothing OLD under the sun.

Presumptuous as it may at first seem to attempt this converse to the proposition of the wisest of men—he himself, we are certain, would have been the foremost to lay it down had he lived in the days of present science and discovery. While geographers and historians are exhausting research, and learning and sagacity are hourly tracking the vestiges of the past, and bringing forth from its ample womb, in the guise indeed of antiquity, facts and systems that were most certainly unknown and undreamed of by those to whom they are now attributed;—while from the wreck of ancient materials, ill-digested, and worse understood, but of boundless and still increasing accumulation, a loose mass of rubbish is collected to fill up any how the interior of the piers, set up and smoothly faced by hypothesis as the sole support of those magnificent speculations wherewith metaphysics originally, and of late logic also, have contrived to bridge over the stream of time, and bear the archæologist from shore to shore; and this without wetting even the sole of his feet in the living waters of truth, that flow continually nevertheless, but of course, far beneath his sphere;—while genius and philosophy quote authority only to deny it, and investigate the relics of early ages solely to prove by their existence that they never could have been, and to gather from their mutual consent and coherence irrefragable evidences of their inconsistencies and incongruity;—the reader, we are sure, will join with us in determining by the aid of modern illumination that antiquity is naught; and he will cheerfully give up all he has been accustomed to regard with respect and reverence—the testimony of witnesses, the declaration of the actors themselves, the narratives of their immediate descendants, the historical traditions handed down with sacred and filial reverence from age to age, the guides and the belief of those who from proximity of time and country could best appreciate them, to follow the dictum and bow before the reasoning of students, who, living centuries after the means of judging had perished, have, with a fair and impartial ignorance of extinct nations and languages, defined the Past to be simply what the Present chooses to make of it.

Some minds there are, and for this we

may thank our universities, who have not been dazzled with the glories of recent illuminations, nor blinded by that excess of light which approximates so nearly to darkness that the Eternal alone can tell any difference between them: minds that—instead of butterfly roving only from flower to flower, of coquetting with languages at the rate of one hour for each, and deriving by a photogenic process the exact and faithful impress of every science current in the same street within ten minutes—are still satisfied to believe that truth can be reached only by a patient study, that reason can be attained only by careful investigation, and that to train the intellect, like the body, for sustained labours and independent energy, long habits of care and study should be formed, enlightened by a slow experience, and exercised with a wide and deliberate judgment and a cautious investigation. They know that the gourd which sprang up in a night, though grateful in the morning, was withered in a day, and they prefer planting the slow growth of the acorn to produce the oak, than see the hurrying pumpkin borne to earth by its trashy fruit. Such minds, and such alone, can afford to be the mock of the scorner they commiserate: for in such minds alone are the conditions of strength and stability, the consciousness of native dignity that asks no shouts from the mob nor the admiring finger of the fool, but leaves to the quacks of the hour the glorifications of noisy applause: the last is the glitter of the moment;—the former is the theme of admiration, the stay of his country's institutions, and the guide, the friend, and the guardian of mankind.

From the difference between the established and the changeable in education, springs necessarily the difference between the intellects so fostered. The man who has patiently viewed the wisdom of antiquity as received both directly and indirectly through the medium of a gradual education, has at least the advantage of that derived experience which the mightiest minds of antiquity, names that have lived in renown for centuries, can afford: and when he considers how little the general course of life differs in succeeding ages, he will be all the less disposed to abandon or underrate the approved masters of wisdom, for the mere sake of voices now known only by their clamours, and names whose chance of celebrity is confined to the passing hour. The educationist, accustomed to yield a slow and cautious obedience, may sometimes err in the reluctance he feels to give up the universal attestation of centuries; but the sciolist, disregarding of the past, has no basis for the present, for in his

theory of life he shuts out experience: he places, like the Brahmin's spurious creed, his speculative world upon an elephant, and that elephant on a tortoise, in ignorance or forgetfulness that the world is poised by counteracting relations; that of these experience is the sole test in our power; and that that which is ever turning must have a defined axis, one universal centre to which every part must relate. It is not, as infant systems would teach us, a series of climates, each holding and spinning out a little system of its own; but one compact and universal globe, whose unity and homogeneity stands evidence for its single beginning.

It is with this distinct impression of Unity on our minds, and of the necessity of supporting all that sustains it if we would sustain the truth, that we now turn to examine the works before us. By one simple test shall we be satisfied to try the question of their genuineness, and apply it to the natural, as well as the historical portions of these works. We know indeed of no other test in a case where the conflicting evidences of high names and important authorities have thrown doubt into the decision of this and other as yet imperfectly understood questions. Writers of deserved eminence, and in Germany especially, have, we are aware, given their decided testimony against the unity of which we speak; but holding this their opposition to the general opinion of mankind, as arising specially from the defects of the once-lauded system of German education, we shall presently take occasion to enter into just so much of that question as may serve to elucidate the case before us.

To the learned notes and elucidations of Professor Hoffmann's Book of Enoch we feel satisfied to refer the more curious reader, because they are peculiarly adapted for the learned; and consequently, like Dr. Laurence's notes also, unfit for a popular periodical, that seeks chiefly to gratify the curiosity of the public at large; but the preliminary dissertation of the late Archbishop of Cashel, in which he notices the principal arguments of Herr Hoffman, contains every thing also that can satisfy the reader, and from this, and his text and Hoffmann's, we shall quote largely.

But we must first turn to the reputed work of the Prophet Isaiah. On this Dr. Laurence remarks:—

"It was certainly noticed by some of the early Fathers. Justin, who suffered martyrdom under Marcus Aurelius, in his Dialogue with Trypho the Jew, distinctly alludes to a principal circumstance contained in it respecting the sawing of Isaiah asun-

der with a wooden saw. Having quoted many passages from the Old Testament to prove the character and mission of Christ, he expresses to his Jewish opponent his full conviction, that, if these had been rightly understood by the Jews, they would have been removed from the sacred text, as those have been relative to the death of Isaiah, who was sawn asunder with a wooden saw."—pp. 141, 142.

Tertullian also, in the same century, considered the work of some authority.

"More expressly also, as an apocryphal production, it is mentioned in the Apostolic Constitutions, a compilation indeed itself apocryphal, and of an uncertain date, but which, in the judgment of Cotelierius, must have been written at some period between the apostolical age and that of Epiphanius.* There it is described as a work even then of some antiquity : *ἐν τοῖς παλαιαῖς δὲ τινες συνεγράψαν βιβλία ἀπὸ κρυφῆ Μωσέως, καὶ Ἐνῶχ, καὶ Ἀδάμ, Ἡσαίου τε, &c.*"—p. 143.

Origen also, in the third century, in the Letter to Africanus, notices the story of Isaiah, confirmed by the testimony of the author of the Epistle to the Hebrews (xi. 37). He takes a similar notice also in his Commentary on St. Matthew.

In the fourth century, Epiphanius, in his account of various heresies, alludes to the work and quotes from it ; as does also Ambrose in his Commentary on the 118th Psalm ; and finally, it is mentioned in a Commentary upon St. Matthew inserted among the works of Chrysostom, and attributed by Montfaucón to the end or middle of the fifth century. After this last period, the work in question appears to have been neglected.

Dr. Laurence proceeds—

"It has been uniformly and constantly asserted by writers of every age, that the circumstance of Isaiah's being sawn asunder was corroborated by a very old tradition among the Jews. Nor is this assertion solely grounded upon a conjectural basis ; for the tradition itself is recorded in the Talmud. In the Mishna of the tract *Jebammoth*, cap. iv. sect. ult. R. Simeon Ben Azai is reported to have found in Jerusalem a volume of Genealogies, or a sort of Biographical History, illustrative of the principal subject discussed in that chapter. Upon this passage of the Mishna the Gemara remarks, that the same volume contained other matter, and then proceeds thus : 'In this [viz. the book found in Jerusalem] † it was written, that Manasseh killed Isaiah. Raba observed : Judging he judged him, and put him to

death. He said to him, Moses thy master said, 'No man can see me, and live.' (Exod. xxxiii. 20.) But thou hast said, 'I saw the Lord sitting upon a throne, high and lifted up.' (Isaiah, vi. 1.) Moses thy master said, 'Who thus hath the Lord in all things, which we call upon him for.' (Deut. iv. 7.) But thou hast said, 'Seek ye the Lord while he may be found.' (Isaiah, lv. 6.) Moses thy master said, 'The number of thy days I will fulfil.' (Exod. xxiii. 26.) But thou hast said, 'I will add unto thy days fifteen years.' (Isaiah, xxxviii. 5.) Isaiah remarked : I know respecting him that he will not receive what I say to him, if I tell him to level his pride. He [Isaiah] then called upon God. [He spoke the name.] A cedar opened and swallowed him. [He was swallowed up in a cedar.] They went to the cedar, and sawed it, When (the saw) came to his mouth, he expired."—pp. 151-153.

Again we find,

"The same tradition is alluded to in an unpublished Targum upon Isaiah, preserved in the Vatican. Asseman gives the following passage from the Targum relating to it : 'And when Manasseh heard the words of the prophecy reproving him, [of his reproof,] he was filled with anger against him [Isaiah]. His guards ran after him to seize him. And he fled from before them. And a carob tree opened its mouth, and swallowed him. The workmen came and cut down the tree. And the blood of Isaiah flowed.'"—pp. 153, 154.

The notice of Justin Martyr carries the antiquity of the book, in our translator's opinion, to a period earlier than the middle of the second century ; but

"When it became altogether buried in oblivion, seems much less certain. In the celebrated night journey of Mohammed, that impostor represents himself as passing through *seven* different heavens, separated by gates one from another, and each guarded by a watchful porter ;† circumstances which might possibly have been borrowed from the 'Ascension of Isaiah.' If so, it continued to be familiarly known in the *seventh* century. But much stress perhaps will not be laid upon this coincidence, when it is considered, that formerly the belief in a plurality of heavens was at least general, if not universal, and in the precise number of *seven* (as I shall hereafter show,) was common among the Jews."—pp. 154, 155.

After this view of its high antiquity as derived from external evidence, the learned editor proceeds to explain the internal arguments that may be deduced to the same ef-

fect. The first of these is, that as it alludes to the proximity of the second judgment, a point alluded to by the Apostles themselves, it may have been written in the first century, as the question died away early in the second.

Further, as speaking of but one persecution, this must have been in the days of Nero ; for it is stated that

“ ‘Berial shall descend, the mighty angel, the prince of this world, which he has possessed from its creation. He shall descend from the firmament in the form of a man, an impious monarch, the murderer of his mother, in the form of him, the sovereign of the world.’ ”*—p. 157.

He was to have power three years, seven months, and twenty-seven days ; now, reckoning backward from the death of Nero, (June, 9, A. D. 68,) and considering the months as lunar and the year 68 as leap-year, the allotted day would be the 30th-October, A. D. 64, which singularly approximates to the time fixed by Mosheim as the commencement of the persecution of the Christians by that monarch.

Farther, as three hundred and thirty-two days are assigned after Nero's downfall for the coming of the Lord and his angels, the translator conceives the book must have been written before the completion of this period had falsified the prediction ; consequently, in the year 69.

Dr. Laurence also considers the work to have been written by a converted Jew, principally, it would seem, from the allusion to the seven heavens of Jewish and Rabbinical tradition, and from the name Samael, as applied to Satan : an epithet which, as not found in the Scriptures, he conceives no Christian could have ventured upon. The learned writer's conjecture may be correct, yet his arguments, we conceive, are very unsatisfactory, and we may hereafter refer to this point in connection with others : before quitting this subject, however, to make room for extracts, we shall just notice that, having shown that the work was, as he conceives, written in the year 69, Dr. Laurence draws thence an argument against the Unitarians, who affirm that the divinity of Christ was unknown till the second century, and that of the Holy Ghost still later.

As this work is curious, and by no means common, we extract rather freely from the Vision of Isaiah :

CHAP. VI.

“ 6. Now while Isaiah conversed with Hezekiah upon the subject of righteousness

and faith, they all heard a gate open, and the voice of the Spirit.

“ 10. Now while Isaiah was conversing with the Holy Spirit, and while they all listened in silence, his soul was raised above its ordinary conceptions ; nor did he perceive the men, who stood before him.

“ 11. His eyes were wide open, his mouth silent, and his mortal mind elevated above itself.

“ 12. (Yet still did he continue to breathe ;) for he beheld a vision.

“ 13. The angel, who was sent to show it, was not of this firmament, nor was he of the glorious angels of this world, but he came from the seventh heaven.

“ 14. And the people, who stood by, except the circle of the prophets, thought that holy Isaiah was taken up.

“ 15. Now the vision which he saw, was not of this world, but of the world concealed from human observation.”—pp. 114, 115.

“ 2. It happened, he said, when I prophesied, according to what you have heard, that I beheld a glorious angel, whose glory was not like that of the angels I had been accustomed to behold, but he possessed a glory and office so great, that I am unable to express it.

“ 3. I saw him when he seized me by my hand, and I said, ‘ Who art thou ? What is thy name ? And whither wilt thou cause me to ascend ? ’ For the power of conversing with him was granted to me.

“ 4. He replied : ‘ When I have taken thee up, and shown thee the vision, which I have been sent to show thee, thou shalt instantly understand who I am ; but my name thou shalt not know ;

“ 5. (For it is necessary that thou shouldst return into thy moral body) but thou shalt perceive whither I shall cause thee to ascend, because for this purpose have I been sent to thee.’

“ 9. We then ascended into the firmament, I and he, where I beheld Samael and his powers. Great slaughter was perpetrated by him, and diabolical deeds, while each contended one against another.

“ 10. For as it is above, so is it below, because a similitude of that which takes place in the firmament, exists also here on earth.

“ 13. Afterwards he caused me to ascend above the firmament into heaven ;

“ 14. Where I beheld a throne in the midst, and angels both upon the right hand and upon the left.

“ 15. Nor were any like the angels, standing on the right hand, for those standing on the right hand possessed a very great degree of splendour. And they all glorified with one voice (the throne being in the midst), glorifying the same object. After them likewise those upon the left hand, but their voice was not as the voice of those upon the right hand, nor was their splendour as the splendour of the others.

“ 18. Again he took me up into the second

* Chap. iv. 2.

heaven, the height of which was as the height from the earth to heaven and the firmament.

"19. The first heaven was distinguished by a right side and a left, by a throne in the midst, and by the splendour of angels. These things also were in the second heaven; but he who sat upon the throne in the second heaven possessed a glory greater than all.

"20. Abundant indeed was the glory of the second heaven; but the splendour of the angels there resembled not that of those who were in the first heaven.

"24. Then he took me up into the third heaven, where in like manner I beheld those, who were upon the right hand and upon the left, and where also a throne was in the midst, and one sitting upon it, but no record of this world was there commemorated.

"28. Again he took me up in the fourth heaven, the height of which from the third was greater than from the earth to the firmament.

"29. There again I saw angels, upon the right hand and upon the left, and one sitting upon a throne in the midst, and there likewise they glorified.

"30. There, too, the splendour and glory of the angels on the right hand exceeded that of those on the left.

"31. Again also the glory of him, who was sitting on the throne, exceeded that of the angels who were upon the right hand, as their glory also exceeded that of those who were below them.

"32. Then he took me up into the fifth heaven.

"33. Where again I perceived that the angels upon the right and the left side, as well as he, who sat upon the throne, possessed a greater glory than those of the fourth heaven."—pp. 116–121.

CHAP. VIII.

"1. Moreover he took me up into the ether of the sixth heaven, where, immediately as I ascended, I saw an effulgence, which I had not perceived in the fifth heaven.

"2. The angels existed in great glory.

"3. A holy splendor and a throne was also there.

"6. I further inquired of him, saying, 'Are there then no associates of angels?'

"7. He said: 'Yes; of the sixth heaven and above, in which from this time there is neither a left side, nor a throne placed in the midst; but it is connected with the potency of the seventh heaven, where dwells he, who is never named, and his Elect, whose name is unrevealed, nor are all the heavens capable of discovering it.'

"19. He now took me into the sixth heaven, where there was neither a left side, nor a throne in the midst, but all were alike in their appearance, and their splendour was equal.

"18. There all invoked the first, the Father, and his Beloved the Christ, and the Holy Spirit, all with united voice."—pp. 121–123.

CHAP. IX.

"1. Then he raised me unto the ether of the seventh heaven. Moreover I heard a voice, exclaiming; 'Whither would he ascend who dwells among strangers?' I feared and trembled.

"2. It spoke of me. And while I trembled, behold, from the same place another voice was uttered, which said, 'Let holy Isaiah be permitted to ascend hither, for here is his clothing.'

"3. Then I inquired of the angel who was with me, and said; 'Who is he that prohibiteth me? and who he that favoureth my ascent?'

"4. The angel answered; 'He who prohibited thee is he, who dwells above the splendor of the sixth heaven.'

"5. And he who turned thee back again is thy Lord God, the Lord Christ, who will be called in the world, Jesus; but his name it is impossible to understand, until he has ascended from mortality.'

"6. He then took me up into the seventh heaven, where I beheld a miraculous light and angels innumerable.

"7. There also I saw all the saints from Adam:

"8. Holy Abel, and every other saint.

"9. There, too, I beheld Enoch, and all coeval with him, who were without the clothing of the flesh: I viewed them in their heavenly clothing, resembling the angels, who were standing there in great splendor.

"10. Nevertheless they sat not upon their thrones, nor were splendid crowns upon their heads."—pp. 124, 125.

He is informed that they were to receive crowns and thrones of glory only after the descent of the Beloved:

"13. 'For the Lord shall descend into the world in the latter days, and after his descent shall be called Christ. He shall take your form, be reputed flesh, and shall be man.'

"14. 'Then shall the God of the world be revealed by his Son. Yet will they lay their hands upon him, and suspend him on a tree, not knowing who he is.'

"15. 'In like manner also shall his descent, as thou wilt perceive, be concealed from the heavens, through which he shall pass altogether unknown.'

"16. 'But after he has escaped from the angel of death, on the third day he shall rise again, and continue in the world five hundred and forty-five days.'

"21. And while I was yet talking with him, I perceived one of the angels, who were standing by, more splendid than that angel who had directed my ascent from the world.

"22. He showed me books, but not books like those of this world, and he opened them. They contained things written in them, but the writing resembled not the writing of this world. Permission being given to me, I read them. And behold the transactions of the

children of Israel were written therein.”—pp. 126, 127.

The Godhead himself is introduced, and most meagerly :

“27. Then I beheld one standing, whose glory surpassed that of all, whose glory was great and wonderful.

“28. And while I was contemplating him, all the saints and angels, whom I had seen, advanced towards him. Adam, Abel, Seth, and all the saints of old approached, worshipped, and glorified him, all with united voice. I myself also glorified with them, and my glorifying resembled theirs.

“29. Immediately all the angels approached, worshipped, and glorified.

“30. He then became changed, and appeared like an angel :

“31. When instantly that angel, who was conducting me, said, ‘Worship him;’ and I worshipped.

“32. The angel added ; ‘This is the Lord of all the glory, which thou hast beheld.’

“33. And while I was still conversing, I perceived another glorious being, who was similar to him in appearance, and whom the saints approached, worshipped, and glorified, while I myself also glorified with them ; but his glory was not transformed into a glory resembling theirs.

“34. Immediately also the angels approached and worshipped.

“35. Then I beheld the Lord and a second angel, both of whom were standing.

“36. The second, which I saw, was upon the left hand of my Lord. I asked who this was. My conductor said to me ; ‘Worship him;’ for this is the angel of the Holy Spirit, who spoke by thee and other saints.”—pp. 127, 128.

The sacred commission of the Redeemer is scarcely in a better or higher strain :

CHAP. X.

“7. Then I heard the words of the highly exalted, the Father of my Lord, speaking to my Lord, the Christ, who will hereafter be called Jesus :

“8. ‘Go,’ said he, ‘descend through all the heavens ; descend to the firmament, and the world, even to the angel, who is in hell, but who has not yet been hurled to utter perdition.

“9. ‘Assimilate thyself to the appearance of all, who are in the five heavens ;

“10. ‘To the form of the angels of the firmament, and carefully guarding thyself be assimilated, even to the angels, who are in hell.

“11. ‘Neither shall all the angels of the world know, that thou, with me, art the Lord of the seven heavens, and of their angels, nor shall they know, that thou existest with me.

“12. ‘Then when with a celestial voice I shall have convoked the angelical and splen-

did host of the heavens, and when I shall have enlarged the sixth heaven, that thou mayest judge and destroy the principalities, the angels, and the gods of the world, as well as the world, which belongs to them, then shalt thou reign.

“13. ‘For they have uttered falsehood, and said ; ‘We exist, and besides us there is no God.’”

“14. ‘Nor when from the gods of death thou shalt ascend to thy own place, shalt thou undergo a change in passing through the different heavens, but with splendour shalt thou ascend, and sit at my right hand.’”—pp. 130, 131.

In descending to, and below the fifth Heaven, the sacred form assumes the appearance of the several inhabitants of those heavens : in the third and second he gives a passport :

“29. Again he descends into the firmament, where the Prince of this world dwells, and where also he gave a passport to those upon the left side, his form resembling theirs ; who, instead of glorifying him, were contentiously destroying each other ; for there exists the power of evil and of short-lived contention.

“30. I saw likewise, when he descended, and became assimilated to the angels of the air, and appeared like one of them.

“31. But there he gave no passport, because they were plundering and assaulting each other.”—pp. 132, 133.

The eleventh and final chapter contains a vision of the Birth, Sufferings, Resurrection, and Ascension of the Redeemer, in the same style of poverty as to imagination and fervour. After this follows an apostrophe to “thee, my father Aaron, since thou hast caused this book to be written upon earth,” and the whole appositely terminates with a wish, or perhaps a prayer, that the writer’s heart may be “rendered happy with a present of venerable cloth, fine in its thread, and good in its texture, of twelve measures long, and four broad:”—which we hope was supplied.

Having given the reader all the extracts in the least deserving notice from this obviously worthless volume, we shall defer any remarks of our own till we come to the consideration of the second work on our list, and which from internal evidence is of far greater value than the preceding ;—so much so, indeed, as to render a careful examination of it necessary.

The Book of Enoch in the two last centuries was the subject of much critical and theological discussion. Having been quoted by Jude in the 14th and 15th verses of his General Epistle,—which, it must be borne in mind, also refers to other works to this

hour unknown and unvalued,—it was preserved until the eighth century, and subsequently lost, till a portion was recovered by Scaliger in the *Chronographia* of Syncellus, then unprinted. This portion he published in his notes to the Canon of Eusebius; but it was far from satisfactory, inasmuch as it did not contain the passage cited by Jude.

A suspicion existed that the work itself might still be extant in an Ethiopic version; and Ludolf examined a book in that tongue brought from Egypt by Peiresc, with the hope of obtaining it; but in vain. The tract in question was a mass of idle superstitions, such as the Ethiopic Church, so far as we know of it, has in every age encouraged, in its anxious reverence for every fragment of traditionary antiquity: but the suspicion we have referred to, and its full vindication, by Bruce's discovery of the long lost book in an Ethiopic version, bears to our mind a strong indication that the work itself was originally Ethiopic. In the Abyssinian Canon it precedes the Book of Job.

Of the three copies brought to Europe by Bruce he presented one to the royal library at Paris, another to the Bodleian of Oxford, and reserved the third for himself. From the last of these copies a summary was given by the editor of that traveller's labours;* the first was incorrectly transcribed by Woide, and translated in great part by the learned and lamented De Sacy; and has lately been again transcribed by Gesenius for a forthcoming translation; the copy in the Bodleian library forms the basis of Dr. Laurence's work.

This version reconciles the Greek fragment of Syncellus with the Ethiopic; and further testimony may be found in Irenæus, Tertullian, and Anatolius. But though the first of these three writers, and Clemens of Alexandria, refer to the book, without noticing its suspicious character, yet it is held apocryphal by the Apostolical Constitutions, Athanasius, Jerome, Augustin, and Nicephorus; uninspired and questionable by Origen; and Tertullian, who believed it to be the inspired work of Enoch himself, yet admits that it was rejected by some, and excluded from the Jewish Canon.

With this division of opinions, Dr. Laurence has justly remarked that its rejection from the Canon of the Scriptures seems an

insuperable objection; that Tertullian, attributing it to Enoch, yet thinks it may have been re-written by Noah; and that St. Paul, no less than St. Jude, has quoted heathen writers, and like him applied the word prophet to a heathen poet.

From Scaliger's opinion of the Hebraisms of the work, as obvious through the Greek translation, Dr. Laurence is encouraged to suspect that a Jew was the author; and he sustains this opinion by the fact of frequent references being made to it in the Cabbala and the Zohar, as a book carefully preserved from generation to generation. Now, since the Cabalistic writers used the Chaldee, the Doctor argues that the genuine work must have been Chaldaic, or Hebrew,—(there is some difference, in these, we think, as regards the question,)—and not a translation. This argument appears to us unsatisfactory throughout.

As to the time of the composition, the citation by Jude fixes the lowest possible date; and according to Dr. Laurence, the captivity of Babylon the highest; since it copies the words of Daniel. The converse, we think, *might* hold here. Farther, begging the question of prophecy entirely in the negative, the learned editor observes that from the 83d to the 90th chapters, an allegorical government of the Jews is carried on under 70 shepherds (or princes,) of whom Saul, David, and Solomon are distinctly alluded to—and though the sum of the three numbers given (37, 23, and 12,) amounts to seventy-two instead of seventy,—yet the first 35 (37) agrees with the number of kings of Israel and Judah until the Captivity, omitting those who reigned but a few days; the 23 next to the Babylonian, Persian and Macedonian kings, precisely that number; and the 12 last to their native princes from Matathias to Herod, to whose reign he assigns the composition of the work.

That it was written but a few years before the Christian era is also presumable from the mention of the Parthians and Medes in chapter 54, who are represented in their might. The former were unknown in history till 250 B. C. as Dr. Laurence observes, and became most known to the Western world by the successive defeats of Crassus and Antony 54 and 36 B. C.; while a distinct allusion occurs in the 54th chapter to their invasion of Judea, which was in the year 40 B. C.

We may digress a moment to observe that the *Medes* as a nation are unknown to Oriental historians, as has often been remarked: but this can scarcely be wondered at when we consider that this word is but a translation of their name, as given by Herodotus in

* Dr. Laurence dissents from the following passage of this summary, as destitute of proof:—"The narrative is bold and fabulous, but highly impressive of the sentiments and character of those speculative enthusiasts, who blended the Chaldaic philosophy with the sacred history of the Jews." We, however, consider it defective only so far as it is somewhat too confined.

the word Sphaco; Mede is the Celtic form, for Dog. But to return.

We are bound to object to Dr. Laurence's theory, that the facts he adduces occur only late in the Book of Enoch; such as the 83d and following chapters; and at earliest the 54th. Now we submit it is not at all improbable that the earlier portions of the work may bear a remoter antiquity, if only in portions; and that the arrangement or completion alone would, as it does fully, bear out the able and astute conjectures of the Archbishop of Cashel.

That traditions of importance were current in early Eastern antiquity we now know enough of it to affirm with certainty; and of the modes of their preservation not a shadow of question is left us. The interweaving such with a later production, would, as recently even, in the case of the Pseudo-Ossian, give to the later and fabricated parts the authenticity of the earlier remains, and enlist the memories and sympathies of mankind in its favour. When we consider the Sibylline oracles, Orphic verses, and Pythagorean maxims of Greece, whatever their genuineness, and the Egyptian traditional poems, the Salian hymns, the Chinese songs of Confucius, and the Tatar distichs of a similar moral nature that bear the name of Oghuz from remotest antiquity, we need not, probably, confine ourselves to the narrow basis of Dr. Laurence's argument, that Enoch's was notoriously an assumed name for a wholly modern compilation. If the Book of Wisdom, according to his argument, be not the actual work of Solomon himself, yet it proves distinctly that sayings or writings of a similar nature were attributed to that monarch, and in supposed existence; or the supposititious work would not be put forth in his name. This mode would facilitate the reception of an imposture; the opposite would do unnecessary violence to the sense of mankind. Dr. Laurence himself seems partially of this opinion when he observes in another place,

"Nor should we forget that much, perhaps most, of what we censure was grounded upon a national tradition, the antiquity of which, independent of other considerations, had rendered it respectable."

We may further remark here, that though we have not, nor can have, any positive proof on either side the argument, there is one test left, and sufficient to build up at least a presumption. The portions of the Book of Enoch that refer to the earliest ages assuredly do not contradict the received records, nor do they servilely follow them. They add, on the contrary, historical facts

apparently; if we may judge by their connection and coherence with the Scriptures. These are certainly few, and thus the more likely to be purely traditional; but it is evident that the general compiler could not distinguish the value of fact from that of visionary childishness, such as the following:

"In proof that the author could not have resided in Palestine, it is only necessary to take into consideration what is stated in the 71st chapter relative to the length of the days at various periods of the year.

"The internal evidence contained in this chapter seems decisive upon the point. For having divided the day and night into *eighteen* parts, the apocryphal Enoch distinctly represents the longest day in the year as consisting of *twelve* out of these eighteen parts.* Now the proportion of *twelve* to *eighteen* is precisely the same as *sixteen* to *four-and-twenty*; the present division into hours of the period constituting day and night. If therefore we consider in what latitude a country must be situated to have a day *sixteen* hours long, we shall immediately perceive that Palestine could not be such a country. It is indeed possible that in order to express an uniformity in the increase of the day after the vernal equinox, so as to lengthen it every month *one* portion regularly, the author might not have been particularly nice with respect to the minor divisions; but he would scarcely have *much* deviated in his result from accurate observation. We may then safely conclude that the country in which he lived must have been situated not lower than forty-five degrees north latitude, where the longest day is fifteen hours and a half, nor higher perhaps than forty-nine degrees, where the longest day is precisely sixteen hours. This will bring the country where he wrote as high up at least as the northern districts of the Caspian and Euxine seas; probably it was situated somewhere between the upper parts of both these seas.

"If the latter conjecture be well founded, the author of the Book of Enoch was perhaps one of the tribes which Shalmaneser carried away, and 'placed in Halah and in Habor, by the river Goshan, and in the cities of the *Medes*.'

"It should likewise be added, that as Media is situated on the southern and southwestern coasts of the Caspian sea, a migration of the captive Israelites, who were precluded from returning to their own country, still further northwards, for greater security and independence, seems not improbable. But it is of no importance to fix with accuracy the country in which this book was written; it is sufficient to be assured that its author indisputably resided in a climate re-

* "At that period the day is lengthened from the night, being twice as long as the night, and becomes twelve parts; but the night is shortened and becomes six parts." v. 18, 19.

mote from Judea ; and this the account given in it respecting the length of day and night, at the different seasons of the year, alone fully proves. Composed, therefore, in the assumed name and character of Enoch, and having been brought into Judea from a distant country, it could not have been well known, or quoted under any other title than that of the Book of Enoch ; and although the generality must from its incongruities have deemed its contents apocryphal, yet might there have been some, who, deceived by its external evidence and pretensions, ignorantly esteemed it to be the genuine production of the patriarch himself."

As we ourselves are strongly disposed, from the very nature of the work before us, to doubt its origin from among the Chaldeans, whose dark and gloomy spiritual system contrasts most assuredly with the calmer genius of Enoch's reputed work, so we may notice here that this gratuitous assumption of the origination among the captive tribes of Shalmaneser, however ingenious, seems adopted in the same spirit as that which assigns the compilation to a Jew. The locality from astronomical statements is fairly and ably traced to Media ; but before we can admit the second assumption, of its Jewish origin in that region, we are forced to inquire whether, since, like the Book of Isaiah, the Book of Enoch was known and suffered to perish by Jews and Christians, and was, like it, preserved by the unchanging belief and predilection of the Ethiopians alone, whether they were not the descendants of its originators ? and in fact we would inquire,

WHO WERE THE ETHIOPIANS ?

We pass from this question ; and, observing that we are no theologians, do not wish to rake up the scepticism of Lücke upon portions of the work before us : yet we must remark that when both Hoffmann and Laurence insist on the doctrine of the Trinity as manifested in this book distinctly, before the coming of our Saviour ; and when the latter eminent and pious divine urges its appearance there as more satisfactory to his mind than the deductions drawn from the Cabbala on this head ; he seems to forget that to make a confessedly spurious work exhibit the only existing indication of that sublime and awful mystery, is admitting that a system of falsehood received that illumination which was denied to the truth till long after. How could this mystery be known to the Jews, or how at least can we know that it was known to them if their works contain no proof of this at the time, and their constant denial subsequently goes far to establish their ignorance ? And can a book whose origin is more than

doubtful, and whose falsehoods are apparent, establish of itself this mighty secret denied to all else ? The Book of Enoch, it may be said, does not prove the mystery, but only the knowledge of that mystery. Yet how, if diffused among the Jews, could it escape preservation by them with the rest of their knowledge ? Would it not be at least as reasonable to conclude, admitting Dr. Lawrence's negative for the Jewish writings, that the sacred development was withheld from a stiff-necked and perverse race, and indeed from man generally till its existence was made visible to the eye ; and, instead of resting on hearsay or affirmation, however sacred, become, we may so say, tangible to sense and evidence ?—as when the Son was on earth, the Father announced him, and the Holy Spirit descended on his head.

The passage in Enoch we suspect to be the Persian theory, with some, but not much modification. The Archbishop gives the following view of it :—

" Here there is nothing Cabbalistical ; here there is no allegory ; but a plain and clear, although slight, allusion to a doctrine, which had it not formed a part of the popular creed at the time, would scarcely have been intelligible. Three Lords are enumerated ; the Lord of Spirits, the Lord the Elect one, and the Lord the other Power ; an enumeration which evidently implies the acknowledgment of three distinct persons participating in the name and in the power of the Godhead. Such, therefore, from the evidence before us, appears to have been the doctrine of the Jews respecting the divine nature antecedently to the rise and promulgation of Christianity "

But deferring for the present our observations upon this and various subjects connected with the question in a greater or less degree, we proceed to introduce the reader to the Book of Enoch itself ; first offering, however, a slight summary of its contents, as given by the late Mr. Murray, the editor of " Bruce's Travels :—

" And Enoch saw a holy vision in the heavens, which the angels revealed to him. And I heard from them every thing, and I understood what I saw. After this follows the history of the angels, of their having descended from heaven, and produced giants with the daughters of men ; of their having instructed these in the arts of war and peace, and luxury. The names of the leading spirits are mentioned, which appear to be of Hebrew original, but corrupted by Greek pronunciation. The resolution of God to destroy them is then revealed to Enoch. These topics occupy about eighteen chapters, which Mr. Bruce had translated into

English, but weary of the subject, proceeded no further. From the eighteenth to the fiftieth chapter, Enoch is led by Uriel and Raphael through a series of visions, not much connected with the preceding. He saw the burning valley of the fallen angels, the Paradise of the saints, the utmost ends of the earth, the treasures of the thunder and lightning, winds, rain, dew, and the angels who presided over these. He was led into the place of the general judgment, saw the Ancient of Days on his throne, and all the kings of the earth before him. At the fifty-second chapter, Noah is said to have been alarmed at the enormous wickedness of mankind, and, fearing vengeance, to have implored the advice of his great grandfather. Enoch told him that a flood of waters would destroy the whole race of man, and a flood of fire punish the angels, whom the deluge could not affect. Chap. LIX., the subject of the angels is resumed. Semeiza, Artukafu, Arimeen, Kakabael, Tusael, Ramiel, Dandel, and others to the amount of twenty, appear at the head of the fallen spirits, and give fresh instances of their rebellious dispositions. At Kefel LXII., Enoch gives his son Mathusala a long account of the sun, moon, stars, the year, the months, the winds, and like physical phenomena. This takes up eight chapters, after which the patriarch makes a recapitulation of what he had uttered in the former page. The remaining twenty chapters are employed on the history of the deluge, Noah's preparations for it, and the success which attended them. The destruction of all flesh, excepting his family, and the execution of divine vengeance on the angels and their followers, conclude this absurd and tedious work."—Vol. ii. pp. 424—426, note. "The reader will perceive that this account is imperfect and inaccurate, particularly that which is given of the last twenty chapters."

Some further remarks in elucidation, from the pen of the late Archbishop of Cashel, may not be unacceptable to the reader:

"As the arrangement of the chapters and verses in the two MSS. appears to be different, and to have been arbitrarily made, I have uniformly followed that of the Bodleian MS., but have noted the sections as they appear in the Paris MS., transcribed by Woide, which is more exact than the other in this respect. The Bodleian only marks them in two or three instances.

"I have remarked, p. xliii, that different parts of the book itself may have been composed at different periods; perhaps it might also be added, that they may have been different tracts; as well as tracts composed by different authors. Thus the first six chapters seem to be Enoch's annunciation of punishment to transgressors. Then commences, in chap. VII. sect. II., his narrative respecting the connection of the angels with

the daughters of men, his elevation to heaven, his vision of the Almighty, his message to the transgressing angels, his vision of heaven, hell and paradise, and his survey of the world's extremities. These details occupy four sections and thirty chapters. At Sect. VI. Chap. XXXVII. begins his second vision, which contains it is said a hundred and three parables, but of these only three are given. Parable the first extends from Chap. XXXVIII. to Chap. XLV. (Sect. VII.); parable the second from Chap. XLV. to Chap. LVI. (Sect. IX.); parable the third, from Chap. LVI. to Chap. LXIX. (Sect. XII.) But here a singular circumstance occurs: Chapters LXIV. LXV. LXVI. and the first verse of Chap. LXVII. are interposed, which contain a vision of the Deluge, by Noah, not as foretold by Enoch, but as related in the first person by Noah himself.

"The subsequent chapters, LXIX. LXX. (Sect. XII.) shortly record another vision of the Almighty. From Chap. LXXI. (Sect. XIII.) to Chap. LXXXII. (Sect. XVI) is contained, 'The Book of the Revolution of the Luminaries,' explained to Enoch by the angel Uriel. This is clearly a distinct tract, comprising a detail of astronomical observations, which he recounts to his son Mathusala.

"The remainder of the book describes dreams and visions which Enoch saw, and which he related to his son Mathusala, and concludes with instructions to his children and exhortations to righteousness."

It is necessary, however, to premise that the translation we have selected is not Dr. Laurence's, but one made from Professor Hoffmann's version, which though it cannot be more true to the sense of the original than the former, has yet the material advantage of a more scriptural turn of expression; an important point when the work is to stand in comparison with the Books of Holy Writ; and scarcely less,—we might under the existing circumstances of confessed Apocryphism, almost say, infinitely more so, if we examine as we ought the question raised as to its origination, in a critical point of view, however slightly.

We call attention especially to the opening, in itself, to our thinking, of very material importance, and so strangely omitted by both Hoffmann and De Sacy. In Laurence's original, the Bodleian MS., it does not occur; but is found in the Parisian and Bruce's own copies.

"In the name of God, the merciful and gracious, slow to anger, and of great mercy and holiness, this book is the book of Enoch the prophet. May His blessing and help be with him who loves him, for ever and ever, Amen.

CHAP. I.—"The word of the blessing of

Enoch, by which he blessed the elect and the righteous, who were to live in the time of tribulation, to the rejection of all the wicked and ungodly. Enoch a righteous man, who was with God, answered and spoke, when his eyes were open, and he saw a holy vision in the heavens. This the angels showed me. 2. From them I heard all things, and understood what I saw, that which will not be done in this generation, but in a generation which is to come at a future time, on account of the elect. 3. On their account I spoke and talked with him, who will then go forth from his mansion, the holy and mighty One, the God of this world. 4. Who will then walk upon Mount Sinai, appear with his hosts, and be revealed in the strength of his power from heaven. 5. All shall be afraid, and the watchers shall be terrified. 6. Great fear and trembling shall seize them, even to the ends of the earth, the lofty mountains shall be shaken, and the high hills depressed, and melt like a honey-comb in the fire, the earth shall be overflowed, and all which is upon it shall perish, when judgment shall come upon all, even upon the righteous. 7. But to them he will give peace, he will save the elect, and towards them be merciful. 8. So then all shall be made happy and blessed by God, and the splendour of God shall enlighten them."—pp. 1, 2.

We give, however, the second chapter containing the celebrated verses (14 and 15) of Jude both from Hoffmann and Laurence.

KAP. II.—"Siehe! er kommt mit Myriaden seiner Heiligen, Gericht über sie zu halten, zu vertilgen die Bösen und zu strafen alles Fleisch über jégliches, was die Sünder und Gottlosen gethan und begangen haben gegen ihn."

CHAP. II.—"Behold he comes with ten thousands of his saints, to execute judgment upon them, and destroy the wicked, and reprove all the carnal for everything which the sinful and ungodly have done, and committed against him."

It is remarkable that in the following denunciations of sinners the threats are moral rather than physical; more according with the earliest, or purely theocratic, system of the Jews, than with the severer punishments denounced after the Chaldean captivity.

"18. But you wait not in patience, nor perform the commands of the Lord, but you oppose and defame his greatness, and the words in your defiled mouths are malignant against his Majesty. 19. Ye withered in heart, for you there shall be no peace. 20. Therefore you shall curse your days, and the years of your lives shall pass away, incessant cursing shall be increased, and you shall obtain no mercy. 21. In those days you shall resign your peace with the eternal maledictions of all the righteous, and sin-

ners shall continually execrate you. 22. They shall execrate you with all the ungodly. 23. The elect shall possess light, joy, and peace, and they shall inherit the earth. 24. But you, ye unholy, shall be accursed."

The following detailed account will supply an important omission in traditional history. The word *Malekath* is translated Angel by both Laurence and Hoffmann, such being its modern sense unquestionably. We must point notice also to the labours of Azazyel (v. 16) and his compeers.

SECT. II.—"1. It happened after the children of men had increased in those days, that daughters were born unto them elegant and beautiful. 2. And when the angels the sons of heaven saw them, they were inflamed with love of them, and said to each other, Come, let us choose for ourselves wives from the daughters of men, and let us beget children. 3. Then Samiaza their leader said to them, I fear that you may perhaps be averse to the performance of this undertaking. 4. And that I alone shall suffer for so great a crime. 5. But they answered, and said unto him, We all swear: 6. And bind ourselves by mutual execrations, that we will not change our intention, but will perform our intended undertaking. 7. Then they all swore one another, and bound themselves by mutual execrations. Their whole number was two hundred, who descended in the days of Jared, upon the top of Mount Armon. 8. Therefore they called that mountain Armon, because they had sworn upon it, and bound themselves by mutual execrations. 9. These are the names of their chiefs, the first, Samiaza, who was their leader; the second, Arstikapha; the third, Armen; the fourth, Akibeel; the fifth, Tamiel; the sixth, Ramiel; the seventh, Danyal; the eighth, Zakiel; the ninth, Barakel; the tenth, Azazel; the eleventh, Armers; the twelfth, Bataryal; the thirteenth, Ananel; the fourteenth, Thausael; the fifteenth, Samiel; the sixteenth, Ertael; the seventeenth, Tumaël; the eighteenth, Tarel; the nineteenth, Yomyael; the twentieth, Sariel. 10. These, with all the others, in the thousand one hundred and seventieth year of the world, took to themselves wives, and they continued in their madness with them unto the flood. 11. And there were born unto them three sorts, the first were great giants, and to the giants were born Nephilim, and to the Nephilim were born Elioud. 12. And they increased in their power, and taught each other and their wives sorcery and incantations. 13. Moreover, Azazel taught men to make swords, knives, shields, breastplates, the fabrication of mirrors, the workmanship of bracelets, ornaments, the use of paint, beautifying of the eyebrows, the use of stones of every valuable and select kind, and of all sorts of dyes, so that the world became altered. 14. Impiety increased, fornication multiplied, and they transgressed and cor-

rupted all their ways. 15. Samiaza taught all the sorcerers and dividers of roots. 16. Armers taught the solution of sorcery. 17. Barakel taught the observers of the stars. 18. Akibeel taught signs. 19. Tamiel taught astronomy. 20. Zakiel taught the inspection of the air. 21. Armen taught the signs of the earth. 22. Danyal taught the signs of the sun. 23. And Sariel taught the motions of the moon. 24. And the giants devoured all that the labour of men produced, until it became impossible to feed them, and after that they began to eat the flesh of men, and men began to be few on the earth, and they who remained called to heaven concerning that evil, saying, Let a remembrance of us be brought before the Most High."

Here follow judgments that accord with the Chaldaic system and the Arabian traditions, but differ from those of early Persia as we shall have occasion to observe.

SECT. IV.—"1. Then the Most High, the Great and Holy One spoke, 2. And sent Uriel to the son of Lamech, 3. Saying, Go to Noah, and say unto him in my name, Conceal thyself. 4. Then declare unto him an account of the end which is to take place, for the whole earth shall be destroyed, the waters of a flood shall come over the whole earth and all things which are in it shall be destroyed. 5. And now inform him how he may escape, and how his seed may remain on all the earth. 6. Again the Lord said to Raphael, Bind Azazel hand and foot, cast him into darkness, open the desert which is in Dudael, and thrust him in there. 7. Throw upon him rugged and pointed stones, and cover him with darkness. 8. There he shall remain for ever, cover his face, that he may not see the light. 9. And in the great day of judgment let him be cast into the fire. 10. Reanimate the earth, which the angels have corrupted, and proclaim life to it, that I may enliven it again. 11. All the sons of men shall not perish in consequence of every secret, by which the watchers have caused destruction, and which they have taught their offspring."

"13. Also the Lord said to Gabriel, Go to the giants, the reprobates, the children of whoredom, and destroy the children of whoredom, the offspring of the watchers from among men; lead them out, and move them one against another, let them perish by slaughter, for they shall not have length of days."

"15. Also the Lord said to Michael, Go, and declare his crime to Samiaza, and to the others who are with him, and who have been united with women, that they might be defiled with all their impurity, and when all their sons shall be slain, when they shall see the destruction of their beloved, bind them for seventy generations in the caverns of the earth, even to the day of judgment, and of termination, until the termination of the everlasting judgment. 16. Then shall they be taken to the lowest depths of the fire in torments, and

they shall be shut up in prison for ever and ever. 17. Immediately after this he, together with them, shall burn and perish, they shall be bound until many generations shall be fulfilled."

The reader will recall from the following narrative of the vision the poverty of the parallel passages in that of the Pseudo-Isaiah, whose genius seems to have been of the meanest order; while this of Enoch in its bold and darting but irregular splendour approximates far nearer to the inspired glories of the prophet Ezekiel.

SECT. VI.—"7. But ye shall weep and supplicate in silence. The words of the book which I wrote, 8. A vision that appeared to me. 9. Behold, in that vision, clouds and a mist invited me on, agitated stars and rays of light incited and pressed me forwards, while winds in the vision assisted my flight hastening my going on. 10. They raised me to the height of heaven, I went forward until I came to a wall built with stones of crystal, a moving flame surrounded it, which began to make me afraid. 11. I entered into this moving flame; 12. And I came near to an extensive residence, which also was built with stones of crystal, for its walls as well as its floors were stones of crystal, and the ground also was crystal, its roof had the appearance of stars violently agitated, and flashes of lightning, and among them were cherubim of fire, and their heaven was water. A flame burned round its wall, and its portal flamed with fire. When I entered into this dwelling, it was hot as fire, and cold as ice. No trace of joy or life was there; fear overcame me and a dreadful trembling seized me. 13. Violently agitated and trembling I fell on my face. In the vision I saw, 14. And behold there was another far more extensive habitation, to which every entrance before me was open, established in a moving flame. 15. So great was the appearance in every respect, in glory, in magnificence, and in magnitude, that it is impossible to describe to you either its magnificence or extent. 16. Its floor was all on fire, above were lightnings and agitated stars, while its roof displayed a flaming fire. 17. I beheld it attentively, and saw that it contained an elevated throne; 18. The appearance of which was like that of sapphire, while its circumference was like the orb of the radiant sun, and there was the voice of the cherubim. 19. From beneath this mighty throne flowed rivers of flaming fire. 20. To look upon it was impossible. 21. One great in glory sat thereon; 22. Whose robe was brighter than the sun, and whiter than snow: 23. No angel was able to press forward to view the face of Him, the Glorious, and the Effulgent, nor could any mortal behold Him; a fire was flaming around him. 24. Also a fire of great compass continued to rise up before him, so that none of those who stood around him came near

to him, among the myriads of myriads who were before him. To him holy consultation was unnecessary, yet the sanctified, who were near him, departed not far from him either by day or by night, nor were they withdrawn far from him; I also was so far gone forward with a veil before my face and trembling; Then the Lord with his mouth called me, and said, Come near hither, Enoch, at my holy word. 25. And he raised me up, and caused me to come near even to the entrance. My eye was directed to the ground."—pp. 11, 12.

We take two verses, regarding the giants.

"9. The spirits of the giants *shall be like* clouds, which shall oppress, corrupt, fall, contend, and bruise upon the earth. 10. They shall cause lamentation. No food shall they eat; and they shall be thirsty; they shall be concealed, and shall not rise up against the sons of men, and against women; for they come forth during the days of slaughter and destruction."

The reader will refer to the passage in Hesiod (Book I., lines 108 to 125*), where occurs this identical word "concealed" (*καλυψεν*) in this incidental sense, of buried, and but for a time; then becoming dæmons, that is to say, good spirits and guardians of mankind. It is remarkable that Homer's Andromache applies the epithet Dæmon precisely in this sense to Hector; and not, we submit, as generally understood, simply as a term of affection but rather as a protector.

It is obvious that Hesiod, describing the Golden Age, distinctly specifies as Men, and as "many-linguaged men," amiable, and delighting in feasts, these whom the Book of

Enoch distinguishes as Giants and oppressors: the double sense of the word Dæmon is the evident source of this discrepancy, and is as strongly marked in Greek, in Coptic, Armenian, and in Cingalese, as in English; sufficient proofs of universality, we opine, to obviate any doubt as to the identity of the race or persons viewed through the Greek or the Ethiopi-Chaldaic medium. Whence the two opposite impressions arose, it will be our business subsequently to examine.

We must remark, however, on two passages of the second verse above-quoted. "No food shall they eat; and they shall be thirsty; they shall be concealed, and shall not rise up against the sons of men, and against women."

On the latter clause "shall not rise up," De Sacy observes, that the sense seems to require, not a negative, but an affirmative; the Greek text of Syncellus undoubtedly bears out this opinion. We shall not follow out Dr. Hoffman's elaborate and unsatisfactory note, but give our own judgment; viz. that it is probably correct and idiomatic; for in other tongues, such as the Indian and the French, the particle *ne* is not negative, but, like the Greek *δε*, strongly affirmative; in the first of these languages it is entirely distinct from the *νη*, and in the second it requires *pas*, &c. to render it negative; standing otherwise in both the cases simply as a confirmative. There is no reason why it should not be so in Ethiopic; and with all deference we submit to Biblical Hebraists that the dying injunctions of David to his son Solomon, as to Barzillai and Shimei, stand in the precise category of the two clauses here under observation; and, if such was the Chaldaic form (considering with Dr. Laurence the Book of Enoch Chaldaic) it affords an additional argument for the Hebrew, and for those commentators who have rendered the two passages of Scripture in a sense according with the general feelings of David.

On the first clause we must observe that the negative of the former part, "they shall eat no food," seems to be transferable also to the second portion, "and they shall (not) be thirsty," as an understood regimen. Sacrifices to the demons or Deity were of "bull's flesh" as well as "the blood of goats," and such also we know from profane sources were the offerings of the Nabathean worship. If, however, the spirits that eat no food could yet drink, it was the precise superstition of the Greeks and the Odyssey (Δ).

We shall proceed to give the remainder of the extract, as our main remarks on the whole must be generally classed under two distinct heads.

* "When Gods alike and mortals rose to birth,
A golden race th' immortals formed on earth
Of many-linguaged men: they lived of old
When Saturn reigned in heaven, an age of gold.
Like gods they lived with calm untroubled mind;
Free from the toils and anguish of our kind:
Nor e'er decrepid age misshaped their frame,
The hand's, the foot's proportions still the same.
Strangers to ill, their lives in feasts flowed by:
Wealthy in flocks; dear to the blest on high:
Dying they sank to sleep, nor seemed to die.
Theirs was each good; the life-sustaining soil
Yielded its copious fruits, unbribed by toil:
They with abundant goods midst quiet lands
All willing shared the gatherings of their hands.

When earth's dark tomb had closed this race
around,

High Jove as dæmons raised them from the
ground.

Earth-wandering spirits they their charge began,
The ministers of good, and guards of man.
Mantled with mist of darkling air they glide,
And compass earth, and pass on every side;
And mark with earnest vigilance of eyes
Where just deeds live, or crooked wrongs arise:
Their kingly state; and, delegate from heaven,
By their vicarious hands the wealth of fields is
given."

SECT. IX.—“1. I then beheld the receptacles of all the winds, and perceived that in them were the embellishments of the whole creation, and the foundation of the earth. 2. I beheld the stone corners of the earth. 3. I also saw the four winds, which sustain the earth, and the firmament of heaven. 4. And I saw the winds working in the height of heaven, 5. Which arise in the midst of heaven and earth, and compose the pillars of heaven. 6. I saw the winds which turn the sky, which cause the orb of the sun and all the stars to set, and above the earth, I saw the winds which bear up the clouds. 7. I saw the path of the angels. 8. I perceived at the end of the earth, the expanse of the heaven above it; then I went on towards the south. 9. Where burnt both by day and night six mountains formed of glorious stones, three towards the east, and three towards the south. 10. Those which were towards the east were of a variegated stone, one of which was like pearl, and another of antimony, and those towards the south were of a red stone; the middle one reached to heaven, like the throne of God, of alabaster, the top of which was of sapphire; I also saw a sparkling fire which was over all the mountains. 11. And there I saw a place on the other side of an extended country, where waters were gathered. 12. I also saw earthly fountains deep in the fiery columns of heaven. 13. And in the columns of heaven I saw fires which descended without number, but not on high, or into the deep, and over these fountains I perceived a place which had neither the expanse of heaven above it, nor the solid ground beneath it, neither was the water above it, or aught on the side, but the place was a desert. 14. And there I saw seven stars like great flaming mountains, and like spirits praying to me. 15. Then the angel said, This place will be the prison of the stars, and of the hosts of heaven, until the termination of heaven and earth. 16. The stars which move over fire, are those who transgressed the commandment of the Lord before their time was come, for they came not in the right time, therefore he was angry with them, and bound them until the time of the termination of their crimes in the secret year.”

SECT. X.—“21. I went from there to another place and saw a mountain of fire flaming both by day and night; I went towards it, and beheld seven splendid mountains, which were all different from each other. 22. Their stones were brilliant and beautiful, all were brilliant and splendid to behold, and their surface was beautiful. Three were towards the east, and strengthened by being placed one upon another, and three were towards the south, strengthened in a similar manner, and there were deep valleys, which did not come near one another, and the seventh mountain was in the midst of them. In position they were like the seat of a throne, and odoriferous trees surrounded them. 23. There was among

them a tree of an unceasing smell, and there was none of all the sweet-scented trees which were in Eden like this in smell; for its leaf, its blossom, and its bark never withered, and its fruit was beautiful. 29. And that tree of a pleasant smell, not one of carnal odour, they shall not be able to touch until the time of the great judgment, when all shall be punished and cast off for ever; this shall be appointed for the righteous and humble, and the fruit of this tree, the tree of life, shall be given to the elect; for towards the north, life shall be planted in the holy place, towards the habitation of the everlasting King.”

* * * * *

CHAP. XI.—20. From thence I went on above the tops of these mountains to some distance towards the east, and went over the Erythrean sea, and when I was advanced far beyond it, I went on above the angel Zateel, and came to the garden of righteousness, and in this garden I saw among other trees, some which were numerous and large, and which flourished there. 21. Their fragrance was good and strong, and their appearance was various and beautiful; the tree of knowledge also was there, and if any one eats of it he will obtain more wisdom. 22. It was like a sort of the tamarind tree, and bare fruit like very fine grapes, and its fragrance extended to a considerable distance. I exclaimed, How beautiful is this tree, and how pleasant is its appearance. 23. Then answered Raphael, an angel who was with me, and said, This is the tree of knowledge of which thy ancient father, and thy aged mother ate, who were before thee, and who received knowledge, when their eyes were opened they saw that they were naked, but they were driven out of the garden. 24. From thence I passed on to the ends of the earth, where I saw large beasts different from each other, and birds different in their appearances and forms, as well as with notes of different sounds. 25. To the east of these beasts I perceived the ends of the earth where heaven ceased, the gates of heaven stood open, and I saw the celestial stars come forth. I numbered them as they came forth out of the gate, and wrote them all down as they came out one after another, according to their numbers, their names altogether, their times, and their years, as the angel Uriel, who was with me, had shown them to me.”

“CHAP. XIII.—10. After this I saw the secrets of the heavens.”

“11. There also my eyes saw the secrets of the lightning and the thunder, and the secrets of the winds, how they are divided when they blow over the earth, the secrets of the winds, of the dew, and of the clouds, there I perceived the place from which they came forth, and were filled with the dust of the earth. 12. There I saw the closed receptacles, out of which the winds were divided, the receptacle of hail, the receptacle of

snow, the receptacle of the clouds, and the cloud which remained in suspense over the earth before the world. 13. I also saw the receptacles of the moon, from whence they came, whither they run, their glorious return, and how one became more splendid than another, their magnificent course, their unchangeable course, their divided and undiminished course, their observance of a mutual fidelity by a decree to which they adhered, their going forth before the sun, and their attachment to their path in obedience to the command of the Lord of spirits, whose name is powerful for ever and ever."

We now come to the vision of Noah.

"CHAP. XXIII.—1. In those days Noah saw that the earth was inclined, and that destruction was near. 2. Then he lifted up his feet from there, and went to the ends of the earth, to the dwelling of his great grandfather Enoch. 3. And Noah cried with a mournful voice, Hear me, hear me, hear me, three times. And he said to him, Tell me what is doing on the earth, for the earth weakens and is violently shaken; surely I shall perish with it. 4. After this there was a great disturbance on earth, and a voice was heard from heaven. I fell upon my face, when my great grandfather Enoch came and drew near to me. 5. He said to me, Wherefore criest thou out to me with a mournful cry and lamentation? 6. A commandment has gone forth from the Lord against those who dwell on the earth, that their end may be, for they know every secret of the angels and every oppression of the devils, and all their secret power, and the power of those who commit sorcery, and the power of binding, and the power of those who pour forth molten images over all the earth. 7. They know how silver is produced from the dust of the earth, and how the drop increases under the earth, for lead and tin are not produced from the earth, as if that were the first fountain from which they are produced."

"19. And they shall confine those angels who disclosed impiety in that burning valley, which at first my great-grandfather Enoch showed me in the west, where there were mountains of gold and silver, and iron, and fluid metal and tin. 20. I saw that valley in which there was great disturbance, and the waters were troubled. 21. And when all this was done, from the flowing of the fire, and the disturbance which troubled them in that place, there was produced a smell of brimstone, which mixed with these waters, and the valley of the angels who seduced others, burned beneath that earth. 22. And rivers of fire flowed through that valley, to which these angels shall be condemned, who seduced the inhabitants of the earth."

The astronomical portion is curiously extravagant.

"CHAP. XXVII.—2. This is the first law
VOL. XXIV.

27

of the luminaries; the sun and the light come by the gates of heaven which are on the east, and on the west are the western gates of heaven. 3. I saw six gates where the sun rises, and six where it sets. 4. In these gates also the moon rises and sets, and the conductors of the stars with those who conduct them; six gates were at the rising, and six at the setting of the sun. 5. All these one after another are even, and many windows are on the right and on the left side of these gates. 6. And first that great light which is called the sun goes forth, the orb of which is as the orb of heaven, and the whole is filled with shining and burning fire. 7. Where its chariot ascends, the wind blows forth. 8. The sun sets in heaven, and turns by the north to go to the east, is conveyed so as to come by that gate, and enlighten the face of heaven. 9. In the same manner it goes forth in the first month by a great gate. 10. It goes through the fourth of these six gates which are at the setting of the sun. 11. And in the fourth gate, through which the sun goes in the first month, there are twelve open windows, from which goes forth a flame, when they are opened at their proper times. 12. When the sun rises in heaven, it goes forth through this fourth gate thirty days, and descends by the fourth gate even with it in the west of heaven. 13. During that time the day is lengthened from the day, and the night shortened from the night for thirty mornings long, and then the day is longer by two parts than the night. 14. The day is exactly ten parts, and the night is eight parts. 15. The sun goes forth through the fourth gate, and sets in it, and turns to the fifth gate, which is in the east during thirty days, after which it goes forth, and sets in the fifth gate. 16. Then the day becomes longer by a second portion, so that it is eleven parts, and the night becomes shorter, and is only seven parts. 17. The sun turns to the east, and comes into the sixth gate, and rises and sets in the sixth gate thirty-one days on account of its signs. 18. At that time the day is longer than the night, being twice the night, and becomes twelve parts. 19. But the night is shortened and becomes six parts. Then the sun rises up that the day may be shortened and the night lengthened. 20. And the sun turns to the east, and comes to the sixth gate, and there it rises and sets for thirty days. 21. When thirty days are expired, the day becomes shortened one part, so that it is eleven parts, and the night is seven parts. 22. Then the sun goes from the west out of that sixth gate, and goes to the east, and goes in at the fifth gate thirty days, and sets again in the west, in the fifth gate of the west. 23. At that time the day becomes shortened two parts, and the day becomes ten parts, and the night eight parts. 24. Then the sun goes forth from the fifth gate, as it sets in the fifth gate, and rises in the fourth gate thirty-one days, on account of its signs, and sets in the west. 25. At that time the day becomes equal with the night,

and being equal, the night becomes nine parts and the day nine parts. 26. Then the sun goes from that gate, as it sets in the west, and turns to the east, and goes forth from the third gate for thirty days, and sets in the third gate. 27. At that time the night is lengthened from the day during thirty mornings, and the day is shortened from the day during thirty days, the night being exactly ten parts, and the day eight parts. 28. The sun now goes from the third gate, as it sets in the third gate in the west, and turns to the east, and goes forth by the second gate of the east for thirty days. 29. And so it sets in the second gate in the west of heaven. 30. At that time the night is eleven parts, and the day seven parts. 31. And at that time the sun goes from the second gate, as it sets in the second gate in the west, and turns towards the east by the first gate for thirty-one days. 32. And sets in the west in the first gate. 33. At that time the night is lengthened so as to double the length of the day. 34. It is exactly twelve parts, and the day six parts. 35. The sun has arrived at its elevation, and a second time makes its progress from that elevation. 36. It comes into that gate for thirty days, and sets in the opposite part of heaven in the west. 37. All that time the night is shortened in its length one part, and becomes eleven parts. 38. And the day seven parts. 39. Then the sun turns and comes into the second gate of the east. 40. And it turns by these heights, thirty days rising and setting. 41. At that time the night is shortened in its length, it becomes ten parts and the day eight parts; then the sun goes from that second gate, and sets in the west, and it turns to the east, and rises in the east in the third gate thirty-one days, and sets in the west of heaven. 42. At that time the night becomes diminished, it is nine parts, and the day is nine parts, and the night is equal with the day. The year is exactly three hundred and sixty-four days. 43. The lengthening of the day and the night, and the shortening of the day and the night, are made to differ from each other by the progress of the sun. 44. By reason of this progress the day is lengthened from the day, and the night shortened from the night."

"CHAP. XXXIII.—5. Concerning the progress of the sun in heaven, it goes in and out of each gate for thirty days, with the leaders of the thousand classes of the stars, with four days which are added, and divide the four quarters of the year which they conduct, and come with the four days."

We proceed to Enoch's dream, of Israel in Egypt.

"CHAP. XXXVI.—The Lord of the sheep descended from his elevated mansion, and went to them, and beheld them. 31. And he called that sheep, who had recently forsaken the wolves, and told him to declare to the wolves, that they were not to touch the

sheep. 32. And that sheep went to the wolves with the word of the Lord, and another sheep met him and went with him. 33. They both together came to the dwelling of the wolves, and spake with them, and declared to them, that from thenceforward they should not touch the sheep. 34. And afterward I saw that the wolves with all their power were very severe against the sheep, but they cried, and their Lord came to the sheep. 35. He began to strike the wolves, who began to lament, but the sheep were quiet, and from that time they cried no more. 36. And I saw the sheep until they went out from the wolves, but the eyes of the wolves were blind, for they went forth and followed the sheep with all their power, but the Lord of the sheep went with them, and conducted them. 37. And all his sheep followed him. 38. And his countenance was splendid and terrific, and his aspect was glorious, yet the wolves began to follow the sheep until they came near them in a sea of water.

"CHAP. XXXVII.—1. Then that sea of water went back, the water stood hither and thither before their face. 2. And while their Lord conducted them, he placed himself between them and the wolves. 3. The wolves however saw not the sheep, but went into the midst of the sea of water, and they followed the sheep and ran after them in the sea of water. 4. But when they saw the Lord of the sheep, they turned themselves to fly from before his face. 5. Then the water of the sea turned again quickly, according to its nature, for it went forth, and rose up, until it covered the wolves, and I saw that all the wolves perished, and were drowned, that followed the sheep. 6. But the sheep went away from this water, and tarried in a desert, in which there was neither water nor grass, and they began to open their eyes, and to see."

Having brought the facts themselves before the reader, we shall now proceed to reason upon them, consecutively, and as nearly as possible in the order in which we have presented them to his view. Hence, it is obvious that, proceeding in a slow, cautious, and, to the best of our means, a searching inquiry, we shall not adopt the favourite continental system of a novel race for every difficulty, nor a separate source for every coincidence. We hold with Unity and Identity:—as to Nature and Man.

It is clear that, since the works of Nature are uniform, and her system in every age of which we can speak with certainty, the same, that there can be no question as to the correctness or incorrectness of a book whose statements are in direct contradiction to her works. We mean not, as in the case of miracles, such works as are in themselves confessed exceptions to the general system:

no such allusion is called for by the volume of Enoch before us: nor can we go into the examination of the visions; there are no means of judging as to these. But when, as in the passages we have last quoted, we find the assertor and claimant of divine revelation giving us a minute detail not only of the etherial and angelic portions of his visions but also astronomical statements; relations of that which yearly and hourly occurs to our own senses in the precise mode in which they presented themselves to our forefathers in the age, whatever it might be, when this book was written:—when we find a detailed notification of the places or receptacles for the winds; their operation as supporting earth and sustaining heaven; their composing pillars, and turning the sky, causing sun-rise and sun-set: when we are told of the **STONE CORNERS** of the earth, of the place or ends of this, where heaven ceased, and the gates of heaven stood open: when we hear of the receptacles of dew, snow, hail, and clouds; and,—to pass over much that might assume the mystery of inspiration,—are required to believe that there are actual and specific gates, through which the sun and the moon regularly pass, and that by such passage it is that the day and night are divided:—when we are asked to believe these things on the faith of the Prophet, yet by the light of science know that not one of these things is true, but on the contrary, however ingenious for an ignorant age or nation, utterly false in themselves and impossible from the system that actually exists;—we know at once what to determine of the work and the writer, and set down both for impostures. They who believe in the inspiration of the book—and such there are to this day even in Europe and England—may tell us that the terms we object to are used in the same sense in the Scriptures; that they are mere figurative expressions, only to be received as such, and not to be taken in their literal sense. But the answer is obvious. There are no such details in Scripture: there are, it is true, the terms; but used so as never to have suggested to any living mind the literal, purely literal sense alone. The gates of the East, the windows of heaven, the tabernacle of the sun, &c. are but passing allusions; forms, not so much of speech as of thought, rendering its images obvious to human perception; and no more: never investing them with tangible properties of shape and substance; never adducing them as actual facts from which no interpretation can shrink; still less insisting on them as the media of processes, upholding, dividing, suspending, revolving, going in and coming

out, of creation; as the very secrets disclosed by Deity, yet positively false and impossible!

The book, then, that affirms falsehood for revelation is in itself false, and the Pseudo-Prophet false also. It is clear that he laid hold of metaphorical terms in their literal sense alone; that he sought to win belief by adopting their phrase, and reverence by exceeding their statements: he has wantonly attempted to pass off the dreams of an ignorant fancy for the marvels of Omniscience, and has succeeded and can succeed only with the most ignorant and besotted of any age. The Hebrew Record, or to speak more correctly, we suspect, its translators, have used, in the absence of science, the language of visible nature: the phenomena of heaven and earth are described as they appear to the eye; and the object of that revelation was Religion, not Philosophy. The very language of the original bears out, everywhere to our thinking, even the very last advances of science: But here is an attempt to combine religious, if such it can be called, with scientific information; and the failure of ONE, is of BOTH. The claims of the two therefore differ, not in degree, but in essence: Fact is Falsehood if the Book of Enoch is true. Nay, so meagre, hard, and impossible are these narratives that they absolutely require even essential alteration before,—and that is seldom,—they can be used for poetry. Little known, and less prized, they have scarcely afforded beyond a single theme for genius, though they are undoubtedly the origin of Zillah's beautiful dream in the World before the Flood, where Javan had

“ Danced with the breezes in the bowers of morn;
Slept in the valley where new moons are born;
Rode with the planets, in their silver cars,
Round the blue world inhabited by stars:”

and furnished perhaps the idea of

“ The Giant King who led the Hosts of Cain.”

But passing this idle claim to inspiration with the contempt it deserves, it does not the less follow that the historical ground-work may have, as it would indeed seem to have, portions of truth. The actual traditions of early ages appear in fact to have been incorporated with the more fanciful flights of imagination by the author; and though it is utterly impossible to determine to what personage the former really belong, yet, borne out and supported as they are by other, unquestionably ancient and various, tradition, and giving and receiving confirmation, both as to circumstances and etymologies, con-

jointly with Biblical, Rabbinical, Greek, Arabian, Persian, and other writers, it cannot be wonderful that, though banished from the canons of Faith and Religion, they were looked on as in portions entitled to Belief and respect, as the maxims and memorials of a patriarchal age; and this by the Fathers referred to, men of ample learning and imbued most justly with a high reverence for antiquity; and who, in its true spirit, felt that the vaticinations of the Bard, under whatever denomination considered, were in their best parts absolute records of the genius and feeling of the age they represented, and true if only in that tone, though not, even in that tone, generally fatidical.

For the coincidence with other narratives, and the, so to say, intersitial particulars, we may refer our readers to the various collections of tradition to which we have already alluded, and to the volume itself; more especially with the notes of Professor Hoffmann. We need scarcely do more than point attention to the fact of the preservation of the name EGREGORI, itself unexplained, but clearly meeting, Philologically and Historically, the etymon of *אגרי* *agri*; *אגורי* *gori*; Field-Dwellers; and, only l, for r, *Agricolæ*, or Husbandmen; the children of Cain, the wanderer: the violent, or robber, of Josephus—the Aghre, or Ogre, of the Persians; hideous, terrible giant.

Cain built the city of Hanoah, or Enoch; and from the roofs, as signifying houses, (like the Latin, *tectus*, &c.) contradistinguished from the race who lived in tents—the Scythians, says Justin, had no home nor roof—we would draw the etymology of the unknown locality, Gog; whose only meaning is found in the Arabic as, a roof.

We shall touch upon this outcast so far as to observe that Nod, (which with the vocalic prefix would be really Eastern Land, or, Land of the Sun,) seems in an early and unsettled orthography to be simply a Settled Habitation or residence: (so *נוד* to dwell or rest) It is formed of the *N*, in Hebrew and Egyptian signifying Continuance, and *Ad*, *ath*, or *ith*; earth, house, or, residence, in Hebrew, Welch, and Irish: the *d*, and *t*, letters of one organ, being always interchanged.

The word *נוד* *n, v, d*: (Navad or Navath) Eastward; of the race who in the 4th chapter of Genesis originated science and arts, too closely resembles not to strike by its analogy with the Nabathi, or race who in profane history advance precisely the same claim; and whom Ovid, the most traditionally learned of Roman Poets, distinctly locates in the East, when *Eurus*,*

“ Eastward, to Nabathæan realms retired,
And Persian steeped, by morning’s sun-beams
fired.”

In declaring our belief that the Beni Alohim were the sons of the Mighty of the Earth, or race of Cain, and that they offered violence to the Benoth Adam, or Daughters of ADAM through Seth, the unfallen, peor, or PURE race,—PEERI of Persian and Arab tradition,—for such was their real fate from the Divs or Bramins, we come near towards identifying these last with the Nabatheans. It will be noticed that the Jewish traditions hold the violent race as MEN, and not sons of God, angels; and that the Ethiopic calls the intruders Malekath, a name synonymous with Kings in the two languages it most closely resembles; Hebrew and Arabic; and by this name the race of Cain ever distinguished themselves—Kai-an(ides), the descendants of Cain or King (Kai). We find too that the chief leader, Samiasa, taught sorcery; others astronomy, astrology, characters or writing, and calculation; and that Azaziel introduced weapons, ornaments, jewels, painting and dyes. In fact all the useful arts attributed by the Persians to their early kings were communicated to the sons of Adam by this Giant or Angel race; they taught, says Ferdousi of the Deevs, writing and thirty languages: like the “many-languaged men” of the golden age in Hesiod.

The Greek poet’s Giants of the golden age turned to Dæmons, or Guardian Spirits, after death; and the second or silver age was engulfed and overwhelmed by the wrath of Jove (*ἔκρυψε*), when the brazen age of violence and war succeeded. Were not these correspondent, without their poetic shrouds, to the sorcerer giants or angels, their giant sons, and the Nephilim? All these, the Deev, and the Peeri, suffered divine wrath; and the fate of the angels in the Pseudo-Enoch confined in caverns, and thrown into Dudaël, are the Arabic and Persian version of the tale.

The coincidences of all this portion of history, or fable—if such we must call it—is remarkable—too much so to be the result of accident, and approaches too nearly even in point of locality to suffer a doubt as to the Unity of their sources. If identical fables, so closely approximating to history professed, could be originated from totally distinct sources, it would be far more wonderful than if there was a common basis of truth for all: and as we at least are taught to believe that all mankind sprang from one source, we are the less disposed to hesitate in crediting that if they did so spring, their

* *Eurus ad Auroram, Nabatheaque regna recessit
Persidaque, et radiis juba subdita matutinis.*

earliest history, however variously disfigured since, must have so agreed.

To connect the Ethiopians with this inquiry will lead us to the question already asked in a former part of this article—Who were the Ethiopians?

Dr. Laurence conceives that their Book of Enoch was originally Chaldaic, from various facts, and from the circumstance of the preference for the number seven. We may observe that this number was much more common with the Persians: to all that the Chaldeans held sacred in this, the others added innumera- bly, and held to, even through the persecution of the Magi, greatly exaggerated as we believe the relation of this to have been. We judge of this last point from Masoudi; and of the adherence, not only from his description of Al Sheez, which the Magi spared, though in the midst of their own Aderbijan, but also from the Pehlivi poem of Wamik and Azra, such as it has at length descended to us. A short specimen will suffice:—

“‘The world of Fire seven wondrous forms displays;
Seven are its sources, which seven rays engender:
Seven are its shrines; seven worship-rites, seven ways;
Seven fuels feed, seven tongues proclaim its splendour.’”

These seven tongues reside in the sun and stars, storms, plants, gems, stones, man and reason. And there are seven blooms:—

“‘The first ray, beaming from the blooming bow,
Dazzles the gazing eye with flowery light:
The second kindles in the living glow
Of glittering gems and iron-stone blushing bright.
Thus sparkling sun-beams in the diamond see:—
Youth is the blossom-time of brute and man,
When life is but ideal mystery;
The loveliest, if restrained by virtue’s ban,
And cautious, empty show and guileful art to scan.

“‘And even as Nature through her kingdom blooms,
So bloom the starry-train, the day, the year:
The day, when morning’s blushing dawn relumes;
The year, when Spring’s first deepening tints appear.
The stars, through evening haze, when æther drinks
The floating glow around their orbits thrown,
That on the gazer soft and softer sinks;—
Are blossoms of a world thus glorious shown,
But, chilled through years at length, to ice is gradual grown.

“‘The stars are but the bloom-dust of the flower
That blossom in one bright, collected glow:
So, in the holiest heart, in holiest hour,
Feelings, like stars, combine in sacred flow
Friendship and gratitude, and praise, and prayer;
And love—the fairest of all blossoms fair
The past, the present, or the future know.’”

We have shown that the Book of Enoch partakes largely of Persian mysticism and tradition. Enoch, said the Sabians, was the first who wrote with a pen. His work, neglected elsewhere, was found among the Ethiopians; and a tradition, or suspicion, long before its discovery, attributed, as we have seen, its preservation to them. Would they have clung to it as a foreign tradition? Would not they, who alone adore the Prophet Enoch, be the sect amongst whom it was most likely to originate? We know that the Ethiopic or Abyssinian church was from Alexandria: we know, or at least have ample room to believe, that the Kabbala was not Jewish, but Oriental and Alexandrian: we are told by Nicephorus that the Abyssinians spoke Chaldaic, or the language of Assyria, and called themselves Assyrians by origin; hence Jude probably found their book in that land. Their classic tongue, the Gheez, is but a medium of Hebrew and Arabic; that is to say, the certain cognate of both. How then could Dr. Laurence assign their sacred book to a Jew, and carry it up to a descendant of Salmaneser’s captives, because the locality suits Media?

As to Scaliger’s argument of the phraseology being Hebrew, it might clearly seem so, when read in Greek, and as a question between this and Hebrew: but we think, so far as we can presume to judge, that the style is not more Hebrew than Ethiopic; and there is one word, at least, which has

puzzled both Laurence and Hoffman, and which certainly is neither Greek, as the latter suspects, nor Hebrew, as perhaps the Archbishop and Scaliger would both admit, were they living. We allude to the word *Ikisat*, over which Gabriel presides, with Paradise, and the Cherubim; (chap. 20.) and of which Hoffman conjectures that "perhaps it stands in the Hebrew text as הכסא, the throne." (!)

We would say, however, that it bears affinity to the Hebrew הכי, as set apart, separated; and to the Greek ΕΚΑΣ and its correlatives, as denoting extension: and with the numeral *sat*, seven, forms the words Seven Climates, (divisions, spaces,) that is to say, the World. Both the words are old Persian, and the first approximates equally to the Hebrew and Arabic. We may add, in confirmation of our opinion, that what the Chaldeans and Arabs style the Seven Earths, was the Seven Climates of Middle Asia; and that the latter, who have borrowed and deteriorated almost every article of their faith from thence, corroborate the probability by a story of a huge angel, whose duty it is to support the seven earths.

Our space warns us to be brief: if, then, we find the Priest race of Persia existing in the time of Tahmuraz* accompanying that conqueror into Assyria; and know, as we have shown, (No. 35, Persia,) that these were not then Fire Worshipers altogether, but Sabæans also: if we remember the blameless life of these, and that certain of the Scythians, as they are loosely called, answer, in the description of Justin and others, to the narrative of Herodotus respecting the Marcobii; if we view the denomination of Abii, as not from Βίος; (signifying "vitam, victum;")—more probably, arcus, a bow?) but a Græcism of the real name; if we know that the Ethiopians, reputed by Homer, Apollonius, Herodotus, Arrian, and Eusebius, as living in India and Africa, also occupied Arabia to the South—the land of the Sabæans, with Saba, Sabeta, Sabteca, Seba; and the land of Asyr in Yemen, up to Sabe, in Petraea; and that Moses sojourning in Madian—the Medes (Madyi, Magi,) made more than one inroad towards Egypt—married amongst them a Cushite or Ethiopian woman; if we recollect that the Sphaco, or Dog, of the Medes is the Sabaco, or Dog, of the Ethiopians; if we remember that Dr. Laurence has placed the author's locality in Media; if we notice that the Sabæans of Tahmuraz's time, were by Ferdousi called Chal-dees; † and if, discarding the idle phantasy

that the Ethiopians received their proper name from the Greeks, either as black or long-lived, (and what, in such case, was their proper name?) if we reject, with Heeren, the form of αἰ and the verb αἰθω, to burn; (and ψ) and if, contrary to this his opinion, we do not forget that, in old Persian as in Hebrew, the commencing consonant takes a previous vowel sound; if we look, however loosely, at the position of the Haniuchi near the Euxine;—we may then rest satisfied to believe the Ethiopian an Asiatic; his country Media at least, if not further East; his appellation Athacæ, (of Ptolemy.) Attegui of the Caspian; his creed, Sabæan; his honouring Abel, and blameless sacrifices, husbandry; his feasting and association with the gods, according to Homer, borne out by the race of the Golden Age and their occupations, in Hesiod; and his name;—not αἰθιο-ος and Greek, but native and E-thi-ouphis, THE MIGHTY SACRED ONES of the earliest Caucasian range.

ART. VIII.—*Histoire sommaire de l'Égypte sous le Gouvernement de Mohammed-Aly, ou récit des principaux événements qui ont eu lieu de l'an 1823 à l'an 1833*, par M. Félix Mengin; précédée d'une Introduction sur l'Arabie, par M. Jomard; accompagnée de la Relation du Voyage de Mohammed-Aly au Fazoul. Paris. 1839.

SINCE the publication of our last political lucubrations, in July, 1839, the positions which European policy was then assuming in the East have been successively established, and the questions that divided the Western world set comparatively at rest—for a time. In the various complications of the general political system, the immense number of considerations and interests which it embraces forbids necessarily the hope of any fixed repose; but since the object of all diplomatic exertion is avowedly the establishment of respective national interests, and the extension of respective national influence, in other countries; we may be permitted to observe, that it is not so much the end as the means employed, that conduces to the permanency of the one, and the weight and the respectability of the other.

It is not always, and in isolated cases especially, that success can be deemed a sure criterion of merit, or wisdom; any more than failure a necessary proof of ineptitude. Yet both are, to a certain degree, the almost inevitable indications of a certain tal-

* See F. Q. R. No. 43, Art. Statuary.

† Is this the same root as the Gaelic CULDEES?

ent, or a certain incapacity ; for it is rarely that accident can fairly be charged with all the results of a given course. And from these results alone can we fairly estimate how far the means were proportioned to the end proposed in the first instance ; and how far the presence or absence of judgment, decision, activity, and all other requisites, was developed in the emergencies that attended the progress of the action.

The British world of pseudo-politicians has just been thrown into ecstasies of rapture, no less than surprise, at the complete success that has attended the recent attempt upon Afghanistan : and so intense is the delight and so loud the gratulations consequent thereon, that the merits of the question itself seem never to have roused one moment's thought.

We ourselves can easily pardon and sympathize with a success, not only so glorious, but, from the quarter whence it comes, altogether so unexpected. Let us not be misunderstood : we do not mean to say that the triumphs of British armies and courage in the East was beyond anticipation, so far as the gallant troops and their leaders were concerned. Enough of experience in the history of India had shown that such a result was at all times calculable ; and still more in a country where the terror of British power had so strongly spread, that the British agent, Col. Wade, had long since, as we formerly stated, distinctly declared that a single British Commissioner could pass freely and unmolested through the country.

This feeling on the part of the natives must not be altogether attributed to alarm : it is on record that the disposition of the people and their now deposed ruler was decidedly, and long since, in favour of an English alliance. With what other prospect, indeed, could the advantages of this be compared, when our own Power was at the gates of Afghanistan for protection and succour ; and all its danger was from Powers at a distance, or else from a feeble, vacillating, and ill-combined rivalry of states or rather factions, nearer its own home.

That the policy of Great Britain in Hindostan had been of late years such as to introduce distrust instead of confidence, and induce enmity in the place of friendship and reliance, few will, we think, be hardy enough to deny ; the rejection of Dost Mohammed's offers of amity with British India on the basis of a trifling pecuniary aid to enable him to maintain his ground against foreign attempts ; and the incertitude, and ignorance, and doubt as to events formally communicated by British residents abroad to the Governor-General, (see No. 46,) which made inactivity pass for fear,

and gave to the ever-changeable policy of the East a motive for distrust and an inducement to hostility, have been stated by us on a previous occasion and confirmed by the Parliamentary papers, the very official reports of the parties concerned. That after such weakness and blindness, both at home and in the East, to say nothing of the great Eastern question as it is termed, any thing like success should ever have attended any measure emanating from such men, is assuredly a source of the most unqualified surprise, and a theme for the sincerest gratulation. They built a wall expressly to run their heads against, and it has fallen upon the adversary ; they dug carefully a wide pit for their own feet, and bound their own eyes for fear they might escape it ; but before they could have time to immerge into it to their own hearts' content, lo, the enemy is found at its bottom !

How much soever we may felicitate ourselves upon this auspicious event, it is nevertheless requisite to distinguish between the glory of the result and the triumph of those who claim the credit of it. No one, we say again, ever could doubt the skill and courage of the gallant army employed, or could question that if success was possible it was sure of achievement. But every one, it is now evident, did very strongly despair of anything like a fortunate issue to the affair in the hands of the ministry that was to guide and conduct it ; and whose preliminary arrangements were such as to have set all calculation at defiance, and all right reason and political justice and foresight in direct opposition to themselves. With the time and the expense requisite for raising a large force in Bengal, and for disbanding it so soon as raised, a really powerful and active adversary would have taken the hint, and stopped all means of aggressive inroad against himself in the narrow defiles that form the gates of Afghanistan. A force friendly to the Cabul chief, and far inferior in number to the smaller army of Hindostan ;—to that we mean which was raised for actual service, and by no means comparable to the Calcutta force so suddenly organized, and so expensively, to allay the sudden and groundless alarms of the Governor General at his own previous ineptitude, and to atone for his neglects ;—a small but friendly force, despatched at far less cost, and in better season, might have entered Afghanistan as auxiliaries, and by an honourable and not extravagant outlay, have secured the guardianship of the formidable passes : but while Lord Auckland insisted, as on the 20th January, 1838, that “the startling communications”

of Sir A. Burnes were of "little importance," BECAUSE they "only marked the desire of the Russian government to push at least their influence to the Indian frontier,"—"Don't be uneasy, it is only I, the wolf;" said that truly harmless personage to Red-Riding-Hood's grandmama:—it is certainly pleasant to find that, warned by the fate of his venerated prototype, our excellent functionary did not in his simplicity answer, "Pull the bobbin, and the latch will come up:" and, though we cannot very easily divine why a matter of such "little importance" should have so suddenly produced so great a stir, it is fortunate perhaps for us that this effect was produced at last, even though on a scale of exaggeration proportioned to the foregoing supineness. So strong, in fact, were the sympathies of ease between the ministries of Calcutta and Great Britain, that while Lord Auckland was satisfying himself that it was only the lion in the lobby, and questioning the propriety of letting him in if he liked it, perhaps to try if he could turn him out afterwards, Lord Palmerston was assuring the House of Commons that he had neither teeth nor claws, and would not bite or scratch even if he could. The change that took place in "the spirit of the dreams" of these two alert diplomatists is no less remarkable, nor its simultaneousness; for about the time that Lord Aberdeen and Sir A. Burnes were being assured that there was no doubt or fear whatever,—not even for the trifling territory of Hindostan—the couriers of the two ministries were crossing each other on the road with despatches of prompt exertion and open hostility! Under such vigilance, and recalling, as all did necessarily, the utter failure of all Whig martial attempts, from Buenos Ayres to Irun, could any one, we repeat, avoid feeling both pleasure and astonishment that any thing in such hands could have succeeded? But after all, was the triumph the ministers', or the army's? The imbecile in Joe Miller boasted that his wife was with child at last—"What then?" said his neighbours, "No one accused your wife."

If the conduct of the government of India was utter blindness, and saved only from disaster by the conduct of the gallant army, is this a theme for triumph? Yet, be it so—but is it a proof that success was deserved by the government, and that their conduct merits, or has acquired, the confidence of any other government so as to place reliance on it? Look at the position of the Five Powers; the good understanding and joint action of whom was so unhesitatingly predicated some time since, and whose only agreement seems to be, not to trust each other. Had any-

thing like wisdom been observed in the conduct of England under the Whigs, would not the Whig government have obtained some tokens of confidence from that Russia which was filled with the sincerest desire to act only in honourable concert with Great Britain!—as we for years had been recommended to believe—if we could. Should we not have seen some fruits of that "fructifying" policy which made English interests subservient to those of France, and by which we were told she would learn to consider us in general fraternization with herself? Yet what is the result? Russia after trying to the utmost her own game in Turkey, foiled by the position of the combined fleets, turns now to use her weight with us only so far as it serves for a counterpoise to France; and France, combining her ships with ours in jealousy of Russia, throws her weight into the scale of Egypt because she would rival our commerce!

Nor less to be considered in this conjuncture is the extreme confidence of our ancient ally, Turkey. Notwithstanding his glorious campaign in the East, she has never, that we are aware of, named Lord Auckland her Grand Vizier; nor appointed the English Knight-Commander of Irun, on the score of his recent campaigns, to retrieve the fortunes of Nazib. Nay, in spite of the wisdom that brought about the strangely felicitous successes of that gallant warrior in the Peninsula, and which, as surpassing all that ever had been hoped from him, was rewarded with the insignia of triumph at home, since it was thought, by some gentle Musidora, that—

—————"The time would come
He need not fly;"

in spite of all this, and of the auspicious commencement of a six months' delay in settling her rights and claims, the Boy-Sultan of Turkey, who at least has read the history of Belgium, has at length resolved not to rule over a land fertile of protocols, even though these should extend over a space double the territory in dispute at present; and he has, in consequence, adopted the resolution of settling his own affairs, at least internally. All this does not show that the recent success is the measure of merit, as regards our ministry, in the eyes of foreigners at least.

The position of Turkey is such, undoubtedly, as to require the strongest measures for her safety; and if she is to enter into the rank of nations, as a breakwater against undue influence in any quarter of the West over the East, it is necessary that her present institutions should be cherished and fostered, and that the state of her internal relations should not be injured by any thing like vio-

lence from without. She is rising from a severe prostration; but perhaps, like Antæus, has gathered strength even in her fall. She knows now in what her weakness consists, and to what means she must look to recruit her exhausted energies. She has discovered that war, even if successful, is not strength; and that this must be obtained by good government on all points of her domestic administration at least. Of her present political position we need say little now beyond quoting the sagacious remarks of a traveller, Mr. Elliott, who more than two years ago perceived its stationary precariousness, when acted on by the fatal policy of England and the other powers. His remarks, no slight proof of their soundness and wisdom, apply to this passing hour as closely as to the time they were written.

"There never was a reign, except that in which the empire was founded, so fraught with important consequences to Turkey as is this. The existing lustrum is charged with her destinies; and Europe, Asia, and Africa await the result with anxious expectation. On the one hand, her resources are almost unlimited; with a population of upwards of twenty millions, a soil teeming with fertility, and an extent of country capable of supporting triple and quadruple its present numbers; there is no degree of eminence known among nations which she might not attain. On the other, obstacles apparently insuperable intervene; the pride of the people must yet be further humbled before they will believe that they have aught to learn; their religion, or its peculiar character opposing every species of reform, must be changed; security of property, clearly defined laws, the administration of justice with equity, sound financial regulations, the selection of public functionaries duly educated and qualified for their respective offices, and a wise international policy, must be substituted for the errors of a system of government based on a false theology.

"But, to effect all this, time is required. For the meanwhile, the empire is hurried to destruction by the pressure from without. Circumstances have forced her into painful contact with the insatiable ambition of the czars, the timid cautiousness of England, the vacillating system of France, and the cold calculating policy of Austria. All these have exercised and still exercise a baneful influence on the divan, which is driven to and fro by fears and menaces, distracted by contentions, and harassed by intrigues. Torn by so many conflicting interests, Turkey would long since have fallen into the hands of one or other of the European powers, had not their reciprocal jealousies rendered it impossible for any one to take possession of her without encountering the cannons of its rivals.

"The present is an interval of strife with

expectation, in which all are watching each, and *one* is baffling all. England parades her fleets in the Mediterranean, displays the prowess of her vessels at the forts of the Dardanelles, and then speedily recalls them, too keenly sensitive of the consequences of a crisis which may be postponed but cannot be averted, and too little alive to the impression communicated by the retrograde movement of her ships, which were wont never to speak but in thunder, and never to thunder but in victory. France, infected with a similar spirit, acts on the principles of the *juste milieu*, and her ambassador is instructed to keep well with all parties; while, availing herself of the relaxation of the rigorous institutions of Islam, and the sultan's inability to humble his vassals, she disperses her travelling politicians through the country, covers the sea with her steamers, and lays the foundation of a new empire in Africa.

"Nor is Austria indifferent. The keen eye of Metternich, whose policy is to maintain for the present, at all hazards, the peace of Europe, already pierces the flimsy veil which unmeaning protocols and cobweb treaties have thrown over the fate of Turkey; and though he be silent, his silence is that of thought, not of sleep. But while others are waiting, Russia is preparing. The colossal Muscovite, having habituated Stamboul to the view of her eagles, has fallen back on her frontier; '*alieni appetens, sui profusus*,' she scatters her gold with a lavish hand; promises and threats are for a season substituted for cannons and Cossacks, and diplomacy is leaving but little for the sword to accomplish; the counsels of the divans are led by her intrigues; her partisans increase in the very family of the sultan; and she awaits with intense anxiety a crisis from which she has every thing to gain, and nothing to lose.

"In the meantime, Turkey, the object of political desire, stands trembling and alone, wooed and deserted by all; with too little ability to protect herself, to fall into the arms that first opened to receive her; alternately sought and rejected by each. But from the inauspicious day in which she crouched under the wing of the Russian eagle, her doom was sealed; the crescent then set to rise no more above the political horizon; and the old Moslim empire of the Ottomans, as established on the principles of the Koran, was at an end. The subject for consideration is not now whether the existence of that can be prolonged. It has already ceased to be. But another question, transcendent in interest, is proposed to the powers of Europe—Shall Turkey continue an independent kingdom? It is clear that she can no longer entrench herself behind the barricade which Mohammedanism erects against the march of intelligence and improvement; she can no longer insult the rest of Europe by an assumption of superiority in inverse ratio to her claim; but if she will consent to remodel her institutions, to receive the impress of European civilisa-

tion, and to admit into her dying embers a new principle of political life, her nationality may yet be prolonged. France and England seem conscious of this truth; and, if their policy be sound, they will exert their influence to regenerate her. Russia is equally aware of it, and hence she strives to retain both government and institutions in a state of inefficiency and decay. The drama is drawing to a close. The denouement is the fate of Turkey!"

The miserable state of trade regulations in Turkey hitherto have been often dwelt upon; but a familiar exposition will enable the reader to understand it more distinctly.

The whole system of government was destitute of order and certainty, and open to the grossest abuses: a fact of which the perpetual changes in the financial department might afford an example. For instance, the tax paid on imports and exports was frequently changed; and sometimes raised on a given commodity, within a month, twenty or thirty per cent. Had it been fixed, however high the rate, merchants could have calculated accordingly; but repeated alterations involved them in inextricable difficulties. A man wishing to purchase corn for exportation, might have been charged two paras a-pound the week before at the Custom-House. If, acting on this, however, he made his bargain, fixed his own price, and prepared to export it, he might find a charge of from four to six paras per pound levied on his exportation. It often occurred that an individual was called upon to pay double the sum required from him but a short time before for the same kind of goods, and also, that he was further compelled to pay the subsequent increased tax on the goods he had previously exported, under a pretext that the Firmaun was then in existence, though not publicly issued. Such severity was used in these cases, that a man trading only on commission, and whose accounts with his employer had been balanced, and their transactions ended, was compelled to suffer this injustice. His remonstrances were of no avail: the revenue was to be collected at any rate; and the helpless agent had to pay for the uncertainty of the commercial regulations.

With these facts before us we cannot wonder that a wise policy has attempted to render even the present state of political uncertainty, affording as it does a breathing-time for Turkey, available for her internal improvement.

"HATTI SHERIFF, READ BY RESCHID PACHA ON NOVEMBER 3, 1839, IN PRESENCE OF ALL THE MINISTERS, ULEMAS, PACHAS, AND DEPUTATIONS OF NATIONS, SECTS, AND RACES SUBJECT TO THE SULTAN.

"All the world knows that in the first times of the Ottoman monarchy, the precepts of the Koran, and the laws of the empire, were a rule ever honoured; in consequence of which the empire increased in force and grandeur, and all its subjects, without exception, acquired a greater degree of ease and prosperity. But since a century and a half, a succession of accidents, and different causes, have led to people's ceasing to conform to the sacred code of laws, and to the rules which flow from it. Thus the internal prosperity and force became changed to weakness and poverty. An empire loses its stability in ceasing to observe its laws.

"These considerations are always present to our mind; and since the day of our accession to the throne, the thoughts of the public good, of the amelioration of the provinces, and the alleviation of the people's burdens, have occupied me solely. If one considers the geographical position of the Ottoman provinces, the fertility of their soil, the aptitude and intelligence of their inhabitants, one remains convinced that, by seeking out efficacious remedies, these may be obtained and put in practice within the space of a few years. So that, full of confidence in the succour of the Most High, and relying on the intercession of the Prophet, we judge fit to seek by new institutions to procure for the provinces of the empire the benefits of a good administration. These institutions relate principally to three things, which are—1st. Guarantees which ensure to our subjects the security of honour and fortune. 2d. A regular mode of fixing and levying imposts. 3d. A regular mode of levying soldiers, and fixing the duration of their service.

"Are not, in fact, life and honour the most precious benefits which exist? What man, no matter how averse to violence be his character, could refrain from recurring to violence if his life and honour be threatened? If, on the contrary, these be secured, a man will not quit the paths of loyalty and fidelity. If such security be absent, every man remains cold to the voice of either prince or country. No one thinks of the public fortune, being too anxious about his own.

"It is most important to fix the rate of taxes. The state is obliged to have recourse to them for the defence of its territories. Fortunately for the people, some time back they have been delivered from the vexatious system of monopolies—those bad sources of revenue. As bad a source of revenue still subsists, in the venal concession of offices. By this system, the civil and local administration of each region is delivered up to the arbitrary will of one man; that is, to the most violent and greedy passions—for if such farmer of the revenue be not super-excellent, he can have no guide but his interest. It is henceforth requisite that each Ottoman subject should pay a certain sum of taxes, proportioned to his fortune and faculties. It is also requisite that special laws should fix and limit the expenses of the military and naval force.

"Although the defence of the country is an important and universal duty, and although all classes of the population must furnish soldiers for the purpose, still there ought to be laws to fix the contingent of each locality, and limit to four or five years the term of military service. It is an injustice in itself, as well as dealing a mortal blow to agriculture, to take away more hands from districts than they can fairly spare; and it is depopulating the country, and reducing soldiers to despair, to retain them all their life in service.

"Without such laws as these, of which the necessity is felt, there can be neither empire, nor force, nor riches, nor happiness, nor tranquillity. All these blessings may be expected from new laws. Henceforth, moreover, every accused person shall be publicly tried, according to the Divine law, after act and examination; and no power shall secretly or otherwise cause any one to perish by poison or by any other means, until a regular judgment has been passed. No one shall hurt another's honour; and each shall possess his property with liberty, and in fear of no one. The innocent heirs of a condemned person shall inherit his property, nor shall the goods of the criminal be confiscated.

"These Imperial concessions extend to all our subjects, of every religion, without exception. Perfect security is accorded to all the inhabitants of the empire in life, honour, and fortune, as wills the text of our law.

"With regard to the other points, which must be regulated by enlightened opinions, our Council of Justice, augmented by new members, and by the adjunction of the ministers and nobility of the empire, shall assemble in order to prepare laws for the security of life and fortune, and the regulation of imposts. Each person in these assemblies will state freely his ideas, and offer his advice.

"The laws respecting military service shall be debated in a military council, at the palace of the Seraskier. When the law is prepared, we will give it our sanction, and write a heading with the Imperial hand.

"These institutions aiming to cause religion and government to flourish, we will permit nothing contrary to our promise. We will have these laws placed in the Chamber of the Prophet's Mantle, and will then swear to them in the presence of the ulemas and the grandees, making grandees and ulemas also swear. Whoever shall infringe these laws shall be punished with the legal penalty; and a penal code shall be drawn up for the purpose.

"All venality and traffic of offices shall be abolished, as the great cause of the decadence of the empire.

"These dispositions, being a revocation of old usages, shall be published at Constantinople, and throughout our empire, and communicated officially to the ambassadors resident there.

"May the High God keep you in his

guard, and malediction on those who shall act contrary to these institutions."

How much some such system was needed, we need only prove by the authority of Marshal Marmont, who examined the state of Turkey with a soldier's eye, as it existed in the time of Sultan Mahmoud. He observes,

"An administration calculated to create and husband resources does not exist in Turkey, and is no longer suited to her. The elements required are absolutely wanting: these are a mass of enlightened individuals, with enlarged and steady views, and unwavering resolutions; but this country probably contains not one such being. Every thing would require to be remodelled at the same moment, for all is under the influence of ignorance and corruption; and whatever Mahmoud may desire in this respect, he is not fated to attain his object, of which he has but a vague and undefined conception. The weakness and misery of his dominions must therefore increase, and the internal disorders that will arise on the first unexpected outbreak, will cause the destruction of a state whose real existence is confined to a single city, and its name will be erased from the list of European nations."

Of the army also the Marshal gives a very minute account.

"The lot of the Turkish soldiers is a very happy one. They are better fed than any other troops in Europe, having an abundance of provisions, of excellent quality, and partaking of meat once, and of soup twice a day. Their magazines are filled with stores, and the regiments have large reserves. The pay of each soldier is twenty piastres per month; the whole of which he receives, as there is a prohibition against withholding from him any part of that sum. In short, everything has been effected that could promote the welfare of the soldier.

"If no fault can be found on the score of the 'materiel,' much is to be said against the 'personnel' of this force. On the arrival of Achmet Pacha, we repaired to the exercising ground. Four battalions were in line, and after inspecting them they manœuvred before me. Nothing could be worse than this exhibition; indeed these men ought not to be looked upon as troops, but merely as a mass of people, bearing the stamp of misery and humiliation: and they are evidently depressed by a knowledge of their own weakness. They all seem to have a willingness about them, but feel ashamed of their occupation; and from the private to the colonel, not an individual amongst them has any conception of his duty. Moreover, the men are diminutive in stature and wretched in appearance: many of them are too young for service, and we are led to inquire what has become of that noble

Turkish people, the lofty, proud, majestic, handsome race of former days, for now we find no trace of them in the existing troops.

"I have endeavoured to discover why they have not hitherto succeeded better with the new system, and I thus account for the failure. The Sultan was desirous of organizing troops according to the European mode, and his ambition was to form an army on the instant. He accordingly raised at once a great number of regiments; but the instructors being merely individuals of an inferior station of life, without capacity or talent, who had been led to Constantinople by the circumstances which attend revolutions, were unfitted to accomplish the object in view.

"The new organization commenced simultaneously in all the corps; and the same description of person was universally employed in endeavouring to carry it into effect. In none of the grades had any man confidence either in himself or in others, and no one therefore had a right to the command, which should always be derived from some superior claim. It is only as a consequence of such a principle that men are ever found disposed to yield obedience. In the troops of all the other powers of Europe there are two admitted titles to precedence: birth and merit. The former has its basis on a higher social grade, which, by giving opportunities for better education, leads to the expansion of the mind; the latter, on the experience and information resulting from previous service. In Turkey there are no gradations in the social order, and the son of the water-carrier is on a par with the Vizier's child, having often the same education. Hence there is no admitted superiority in those invested with power, and the previous equality indisposes others to obey authority obtained through mere caprice.

"As to the right derived from mere experience, there can be none where all are novices.

"Such were the radical defects that prevailed in the formation of the Turkish army.—The remedy would be to reduce things to their elements, and to recommence by establishing, in public opinion, a respect for talent and capacity, in order to obtain that obedience and confidence in superiors, without which an army cannot exist; for it is such confidence that produces discipline and order, and creates the moral power requisite to give unity, compactness, and energy to the whole.

"If, instead of attempting to raise an army, as it were, by a mere decree, the Sultan had been content with forming a single battalion, and had obtained the services of thirty or forty really good officers, and a chief capable of comprehending the importance of his duties, it is probable that, in two years, he would have succeeded in producing a battalion to serve as a model for the rest, and this result once obtained, the Sultan would have possessed the elements re-

quired. At the end of six months, or at the utmost of one year, by adding to the number of those first enrolled, and dividing the whole into two battalions, he might have formed a complete regiment, for the men of the first levy would, in the eyes of the recruits, have appeared as old and instructed soldiers. It is obvious that in ten years he would thus have obtained an army. Whereas, according to the system followed, such a result is improbable, for an union of men like the present cannot be said to merit this title.

"When Peter the Great wished to form his troops in Russia, he adopted the principle that I have above described, and he pushed its details even to excess."—p. 61-65.

The capabilities of the Turks for seamen are by no means so generally known, as the former custom of employing Greeks was supposed to indicate both a distaste and an incapacity of the Osmanlees for the sailor's arduous life. It would appear that this is by no means correct. Marshal Marmont states,

"I was much surprised at the wonderful expertness of the crew of the *Mahmoudie*, composed exclusively of Turks. By command of the Capudan Pacha, they performed the small-arm and great-gun exercise, manned the yards, went aloft and came down by the stays, the whole being done with a celerity and precision that could not have been surpassed by the smartest French sailors. On expressing my admiration to the Capudan Pacha, he replied, 'It is by dint of pains-taking and punishment, that I have brought things to this state, for there is not one of these fine fellows who has not received five hundred blows with the stick.' It would appear that a severity of corporal punishment is suited to the Turkish character, for these men are thoroughly drilled in their exercise, and well disciplined; and as there were at the period of my inspection only eight invalids in this crew of 1200 sailors, we may infer that in the system adopted there is nothing injurious to health.

"The Capudan Pacha is evidently a man of energy and resolution, and he is the only one of that stamp with whom I met at Constantinople.

"If severe punishments, and measures of violence bordering on brutality, succeed with Turkish seamen, the same treatment might be equally efficacious with the army, and some military chief, resembling the Capudan Pacha in character, might follow it and render an inestimable service to his country."—pp. 70, 71.

Much of the foregoing extracts, however, may be considered as painted somewhat too strongly by the gallant Frenchman. We subjoin, therefore, the general remarks of his trans-

lator, Sir Frederick Smith, of the Engineers,* whose high talents, acknowledged judgment, and experience on these subjects, united with great professional skill, and a thorough knowledge of the countries he surveys, entitle his opinion to the highest consideration. We quote from his remarks at the end of the volume, as a corrective to the observations of M. Marmont; and only regret that they are so concise as to suit rather with the writer's modesty, than his merits and facilities for deciding.

"When on the other hand it is advanced that Russia is already too extensive to be strong, and that further extension would produce nothing but weakness, it does not appear to us that the case is fairly stated. Many of her late acquisitions may be regarded as purely territorial, and while they have added nothing to the wealth of the empire, they have probably diminished for a time its strength, because considered politically as well as mechanically, force is produced by concentration. But the true way of looking at the recent acquisitions of Russia, is to regard them as means for the attainment of some great end. They are like the approaches of a skilful engineer, in the attack of a fortified place, and Turkey may be considered as an outwork, which, when captured, will not only be valuable in itself, but lead to further success."—p. 137.

"It is well known that Russia has long been desirous of possessing a harbour in the Mediterranean, both for commercial and warlike purposes. Smyrna is the one that would most promote the commercial advancement of Russia; and unless the policy of the other great powers is speedily changed towards the Ottoman Empire, not only will Turkey in Europe, but Turkey in Asia, fall under the dominion of Russia, and as a matter of course she will then become possessed of Smyrna; one of the finest ports in the world.

"The question which therefore appears to us to be now of more importance than any other connected with foreign affairs, that can engage the attention of the British statesman, is how to save the Turkish Empire. There may be doubts as to the real feelings of the Sultan towards England and towards Russia, and also as to his seeing through the veil of pretended friendship, with which the latter seeks to hide her ambitious projects. These are speculations, however, into which it is unnecessary to enter, for it is known that in the councils of the Grand Signior, there are men who, although they may still feel mortified at having been abandoned by England and France, when both were

applied to for that succour which the Russians were glad to afford, yet are aware that if they could rely on the firmness of England, it is to her, to their old and natural ally, to whom they should attach themselves. For the Turks cannot fail to perceive, in whatever manner the question may be mystified, that the essential difference between the protection or alliance of Russia, and that of England, is, that while it is the manifest interest of the former to annex Turkey as an integral portion of her dominions, it is more clearly the interest of England to secure the independence of Turkey, and to give her all the energy and force of which she is susceptible.

"That Russia possesses great influence in Turkey is unquestioned, but it is an influence created not by affection, or by a sense of obligation, but by that dread of power which a feeble state must ever entertain of a strong and grasping neighbour.

"Whatever may be their dread of the Russians at the present moment, the Turks entertain no fear of being able to defy them if time and a fair opportunity for organization were allowed. For they have not forgotten that the best troops of Russia, commanded by her ablest generals, took two campaigns to pass the Balkans, and lost in the operation the greater part of their force;* neither are they unobservant of the impotent attempts of Russia to subdue a handful of Circassians; and it is believed that though the Turks are aware that their soldiers are not on a par with those of Russia, they conceive themselves in no degree inferior to the Russians as sailors.

"We may therefore conclude that the Turks are ready to avail themselves of any fair pretext for throwing off the Russian yoke, and that they would naturally look to England rather than to any other power for assistance.

"The regeneration of Turkey can only be effected by her acquiring such a physical force, as will enable her to become independent of Russia, and by her adopting such a system of civil government as will give security to life and property, and promote agriculture and commerce.

"When the occupiers of the land shall have a certainty, that no demand will be made beyond such a fixed tax, as will leave them a fair remuneration for their labour, agriculture will necessarily flourish; and in order to produce this certainty, little else appears to be requisite beyond the regular payment, from the public revenues, of the district pachas, with all their subordinates, and the establishment of severe penalties on any functionary, who may make exactions from the people."—p. 320-323.

* The Present State of the Turkish Empire, by Marshal Marmont, Duc de Raguse. Translated, with Notes and Observations on the Relations of England with Turkey and Russia, by Lieutenant-Colonel Sir Frederick Smith, K. H., of the Corps of Royal Engineers. London. 1839.

* The Russian army marched with a force of 150,000 men, and what from disease, the sword, the consequences of a bad commissariat, the necessity of leaving troops to garrison fortified places on their line of march, only thirty thousand are said to have reached Adrianople.

"The Turkish navy would probably have soon recovered from the effects of its defeat at Navarino, had it not been for the separation of Greece, for it was from that country that the crews of the Turkish ships were generally obtained. But we may hope from the specimen afforded by the crew of the *Mahmoudie*, which consisted entirely of Turks, and whose extraordinary expertness excited the astonishment of Marshal Marmont, that the whole of the Turkish fleet might by proper discipline become equally efficient, and that by the aid of experienced English officers, it might soon be made a match for the Russian fleet."—p. 324.

"The French system of field movements was the one selected for the Turkish infantry, and officers who had retired from the French service were appointed to be the instructors. This selection was very unfortunate, as the French system seems to be much less suited to the character and peculiarities of the Turkish people, than either that of the English, or of the Prussians."—pp. 327, 328.

"In Turkey there is but one class, and in that the sons of the Vizier, and those of the carriers of water, have the same education. As a consequence of this state of things not only the private soldiers, but also the superior officers, are taken from among the mass of the people, the latter being selected sometimes in consequence of their higher attainments, but more frequently according to the caprice of those in authority. Here is one great cause of the present defective state of the Turkish army; and if it be an evil to appoint incompetent persons to situations of responsibility, it is no less so to remove the deserving from such posts from mere caprice and prejudice. This, however, is so frequently the case in the Turkish service, that the officers never feel secure in their positions, and therefore neither acquire confidence in themselves, nor obtain the respect of their men. So long as this mode of treating the officers may continue, the Turkish army can never attain to any great degree of excellence. The first step towards placing it on a proper footing, will therefore be to educate the officers, and to give them a certainty of retaining their rank during good conduct. This can only be done by the adoption of a sound and rational military code, in which, amongst other enactments, it should be declared that an officer will not be liable, under any pretence, to be removed, or otherwise degraded or punished, excepting by the award of a court of his peers; and that the highest authority shall have no power to increase the sentence of this court.

"A school of mutual instruction, on the Lancasterian system, has been established for the army, from which much good may be expected to result, but in order to give greater value to this institution, the students should be divided into classes. By this means young men of very decided talent

might be advanced to a superior class, to be educated for the duties of officers; and during their progress through this higher class, they would, owing to their acquirements, ensure the respect of the body from whom they had been separated.

"By thus obtaining an educated class of men for the rank of officers, by paying them well, and by making promotion in their inferior regimental grades depend entirely upon merit, and in the superior regimental stations on seniority, a great step towards the formation of a respectable army would be taken. It is therefore to be hoped that should the English government possess or hereafter acquire influence with the Porte, it will be exercised in bringing about this improvement.

"It would be undoubtedly a work of time to give the superior officers of the Turkish army a knowledge of the art of war on a grand scale, but this would be less necessary if a close alliance were entered into between England and Turkey, for in that case the latter would have the assistance of the best officers of the former power. The object of present importance is, therefore, the training of the men, and if adequately provided with intelligent instructors from the British service, there can be no question, that in six months the Turkish infantry might be put into good fighting order. It is not contended that in this space of time they could be taught to manœuvre with all the precision or the celerity of the English, the Prussian or the French army; but from the aptitude of the Turks for acquiring a knowledge of military details, we may feel assured that they would be rendered expert in the use of the musket, and capable of performing with sufficient accuracy those movements which are usually required in the day of battle.

"The Turkish cavalry have adopted the system of field movements of the French cavalry. This has been very judicious, because in the French service steadiness and order are considered as essential for the cavalry, as they are deemed unimportant for the infantry, and therefore the system of the former is well suited to the Turks.

"The horses of the Turkish cavalry are strong and active, and, though not large; they have more bone than Arab horses, and are admirably calculated for light cavalry."

"The artillery are the best soldiers in the Turkish army, and notwithstanding the defective nature of the carriages, they work their guns with great dexterity."—p. 332.

From the extracts made by us, and the perusal of the *Hatti Sheriff*, it will be seen that the Turkish ministry are sufficiently able and informed as to the most pressing necessities of the country; and that in this respect they agree perfectly with the works we have quoted. The security of honour and fortune, which leaves nothing to chance

or despotic caprice, as it insures the possession of one's position in the state, renders him also more careful not to infringe the rights of others, lest he be judged by the world to have deservedly hazarded his own. This creation of two fixed principles, the one internal, of moderation, and the other external, of public opinion, is the sure pledge of what is most wanted in Turkey, namely, moral reform—by which every man shall feel his own value, and that of the rest.

Closely connected with this is the regulation of the mode of levying imposts; for it teaches the nation at large not only what are their own rights and those of the government, but also inculcates habits of provision and foresight, and teaches each individual that, by apportioning a small share to the necessities of the state, he thereby secures the enjoyment of the remainder at his own choice, instead of so secreting it as to make the very means of a Moslem's expenses a subject of mystery to the whole world of scrutinizing pachas and inquisitive travellers. When a man in office has a fixed duty, he can always tell how to discharge it, and has a pleasure in its proper fulfilment; but when acts such as the raising men or levying money are to be performed, and by no recognized principle, is it wonderful that passion and interest will always prevail? and when each needy governor knows that he too is liable to be fleeced by his superior, a system of distrust and general spoliation is generated which more than all else demoralizes a nation.

On the navy and army it will be little needful for us to make any remarks beyond the hints thrown out in Sir Frederick Smith's volume; but if the general tone of the nation is raised, their's also will be elevated in proportion, and not, as in the case of the Janissaries, at the expense of the community at large.

With these primary reformatations, the Turks can well afford to wait awhile for the charms of music and wine, and even the more intellectual luxury of painting. But this will probably follow soon. The formation of a Council of State, which has actually taken place, and which decides by majority, and not, as before, by power or favouritism alone, upon the measures to be adopted and laid before the Sultan: in which council too each member has the right to deliver his opinion uninterrupted, and on each clause of a law as presented, and after a previous opportunity afforded him of examination of details by a printed report distributed to all the persons composing the council, on the plan of the French Coun-

cil, is a bold step towards real liberty. From the recent corrupt state of the Turkish Court, the reporters of the council will doubtless be closely watched.

We have heard it objected that no electoral law has yet been promulgated or announced. But this, to our thinking, is a proof of wisdom. What could the Turks, by far the greater part of whom have no conception of a system of government of any kind, make of the power to choose a member of a public chamber? Education must become far more general, even among the middling classes of that empire, than at present, before they could be entrusted with a gift so powerful and so dangerous. The natural indolence of the Turk must be thrown off, his general indifference to externals beyond his own immediate circle abandoned, and habits of care and activity, and a taste for public business, created in their stead, before he could avail himself advantageously of the boon. It is, we conceive, more prudent as well as more graceful to let Royalty divest herself by degrees of the attributes of long accustomed despotism.

In regarding the general position of Turkey, the transition is necessary to the great vassal, if not rival, of her existing power. So much has been said in every shape of praise or vituperation of this extraordinary man that we need add but a few remarks on that head to what we stated in a previous number.

It is true that the personal talent of Mehemet Ali, and his riches, have exerted the greatest influence upon all who have approached him. It is nevertheless unquestionable that his severities to the natives of Egypt and Syria, have been of the most direful character. The incessant insurrections of Syria, once more, as we are writing, in full revolt, answer for her impatience, and we have been ourselves told by more than one traveller into the interior, and have seen it in the MS. narratives of others, that the most fearful tyranny is exercised in provinces remote from his immediate sway, and less under the eye of Europeans: and that in Egypt especially the most fearful scenes were of every day occurrence. Assuredly the Egyptians even of the present time deserve the character they obtained centuries ago, of indifference to kindness and indeed to everything but fear: yet a humane legislature would not push to the utmost atrocities that make nature shudder, whatever the object of his endeavours. In many cases gratitude, in others policy, prevents the publication of his cruelties; and travellers who expect again to revisit the dominions of Mehemet Ali are careful to suppress anything

that may tend to deteriorate his reputation in Europe, as they themselves would suffer by it. After these remarks we proceed to a short narrative that speaks in favour of the keen-sighted policy of the Pacha, as shown in his rise ; a subject that cannot, however often repeated, become uninteresting at the present day.

The politics of people in the East are ill understood in Europe. We imagine them to have designs, when they are but caprices ; plans, when they are but passions ; and to look to a future, when to-day and to-morrow embrace the whole foresight. We have perceived in the aggression of Mehemet Ali, a premeditated and long progressive ambition ; it was but the seduction of fortune, which, from one step to another, led him almost involuntarily to shake the throne of his master, and to conquer half his empire ; a fresh opportunity may carry him still farther.

The quarrel originated in the following manner :—Abdallah, Pacha of Acre, a young inconsiderate man, raised to the pachalik by a caprice of favour or hazard, had revolted against the Grand Seignior ; being overcome, he had solicited the protection of the Pacha of Egypt, who secured his pardon from the Divan. Abdallah, soon forgetting the gratitude which he owed to Mehemet, refused to execute certain conditions sworn to in the period of his misfortunes. Ibrahim marched to coerce him ; he found at Acre an unexpected resistance ; his anger was roused ; he demanded from his father fresh troops, which were sent, and they were also repulsed. Mehemet Ali grew tired and recalled his son ; but Ibrahim resisted, and declared his intention of dying under the walls of Acre, or of reducing it to the power of his father. He at length broke open the gates of the town, at a great sacrifice of men. Abdallah, being taken prisoner, prepared himself for death ; Ibrahim sent for him to his tent, and having addressed to him a few bitter sarcasms, dispatched him to Alexandria. Instead of the bow-string or the sabre, Mehemet Ali sent him his own horse, made him enter in triumph, seated him by his side on the divan, complimented him on his valour and fidelity to the sultan, and gave him a palace, slaves and large revenues.

Abdallah deserved this treatment for his bravery. Shut up in Acre with 3000 Turks, he resisted for a year the whole of the Egyptian land and sea forces. The fortune of Ibrahim, like that of Napoleon, vacillated before this rock. If the Grand Signior, in vain solicited by Abdallah, had sent him a few thousand men at the proper time, or

had even sent to the Syrian coasts two or three of those fine frigates which were uselessly lying at anchor before the pavilions of the Bosphorus, Ibrahim had been repulsed ; he would have retreated into Egypt, convinced of the impotency of his rage. But the Porte was faithful to its system of fatalism ; it permitted the ruin of its pacha to be accomplished. The bulwark of Syria was overthrown, and the Divan awoke not from its torpor before it was too late. However, Mehemet Ali wrote to his general to return ; but he, a man of courage and enterprise, determined to test to the uttermost the weakness of the sultan and his own fortune. He advanced. Two brilliant victories, weakly disputed, that of Homs in Syria, and that of Konia in Asia Minor, rendered him absolute master of Arabia, of Syria, and of all those kingdoms of Pontus, Bithynia, and Cappadocia, which at present compose Caramania. The Porte might yet have cut off his retreat, and, disembarking troops in his rear, have retaken possession of the towns and provinces where he could not leave sufficient garrisons ; a body of 6000 men thrown into the defiles of Taurus and Syria had imprisoned Ibrahim amidst his victories, and made prey of him and his army. The Turkish fleet was infinitely more numerous than that of Ibrahim, or rather the Porte had an immense and magnificent fleet ; Ibrahim had only two or three frigates. But from the commencement of the campaign, Kalil-Pacha, a young man of elegant manners, the favourite of the sultan, and named by him Capitan-Pacha (High Admiral), had retired from the seas before the small force of the Egyptian ; he had actually quitted the harbour of Rhodes, and sailed to shut himself up in the road of Marmorizza, upon the coast of Caramania, at the bottom of the Gulf of Macri. Once entered with his ships into this port, the entrance of which is singularly narrow, Ibrahim, with two vessels, could prevent him coming out. He, in fact, came out no more, and all winter, when the military operations were the most important and decisive on the coasts of Syria, Ibrahim's fleet alone appeared in those seas, and carried him, without obstacle, reinforcements and munitions of war. Still, however, Kalil-Pacha was neither a traitor nor a coward ; but thus go the affairs of a people who remain lethargic when all is in motion around them. The fortune of nations lies in their genius ; the genius of the Ottomans now trembles before that of the weakest of their pachas. The rest of the campaign, which recalls that of Alexander, is well known. Ibrahim is incontestibly a hero, and Mehemet-Ali a great man ; but all their fortune rests upon their

own two heads ; take away these two men, and there is no more an Egypt or an Arab empire, there are no longer Maccabees for Islamism, and the East will return to the West, by that invincible law of nature which gives empire to intelligence.

After our previous remarks it will be amusing to trace the opposite opinions of Marshal Marmont and our own acute and sagacious traveller, Mr. Elliott. The former observes

“The creation of the power of Mehemet Ali is in itself a dismemberment of Turkey, with which the new state forms a remarkable contrast, and although this is not the moment for a full consideration of the subject, yet I feel bound to offer a few remarks upon it. All the requisites for organization, of which Turkey is deficient, have suddenly sprung up in Egypt, and are earnestly and unremittingly employed towards the attainment of the desired object. Mehemet Ali is accused of being covetous, and of exposing the people to be plundered by his officers ; but by no other course than that adopted could he procure the funds required for his operations. I speak neither of the justice nor philanthropy of the question, but of its policy. The Viceroy has already made great progress in his undertaking, by establishing a system of obedience, and a perfect police, in the extensive country under his control ; his name is respected, and such is the opinion entertained of him, that opposition to his will never enters the mind even of those who were previously the most inclined to independence, or rebellion. This is the foundation of regular order ; for the first step in civilisation is to produce submission.

“The second important act of Mehemet Ali was the change he originated in the agriculture of Egypt, by inducing the ‘Fellahs’ to adopt a system from which crops of infinitely greater value have resulted. If success continue to attend his various improvements, and if the works he has commenced answer his expectations, there will be a further increase of revenue, although even now seven times the amount this country yielded to the French troops at the period they occupied it. Manufactures, suited to the natural circumstances of Egypt, have been established, and are prospering ; they suffice for the necessities of the government and the wants of the people, and compete with those of other nations in the European markets.

“Those who take a contracted view of the present position of this country might be led to conclude that the Pacha alone profited by these riches, because the bulk of the inhabitants are not supposed to derive any immediate or tangible benefit from them ; but it should be remembered, that the Arabs are desirous of rising in the scale of nations, by becoming independent of Turkey ; and that as the wealth acquired by their ruler,

and applied to promote his political power, is in furtherance of this object, the people are so far positive participators in the improved condition of the state. When the necessities of Mehemet Ali shall have been satisfied—when his enterprises shall have ceased to require the immense expenditure they now demand—when articles of commerce shall have increased in value—and when the Pacha shall purchase what he now requires as imposts—there will be an improvement in the condition of the whole community, who will be disposed to assist in supporting his government. Mehemet Ali has accomplished another great object in establishing an efficient force. He now possesses an army, the formation of which presented extraordinary difficulties, for the extreme repugnance of the natives of the East to a regular military service, and their prejudices on this head, are well known ; yet he has overcome all these obstacles by acting discreetly, and by adopting such preliminary measures as were calculated to insure success ; satisfactory results have been already obtained, and he is following a course that must lead to their extension and improvement. Officers are instructed, in the various schools, for all branches of his service ; and the confidence he reposes in a clever man, who is the foundation-stone of the edifice he is rearing, is a guarantee that, in a very few years, his army will bear a comparison with those of Europe. The means at Mehemet Ali’s disposal, for the establishment of his naval force, were limited, and the materials of which it was composed, as well as the national circumstances at the time of its formation, were unfavourable to its success ; nevertheless it is as formidable as the exigencies of his situation require, and being well appointed and efficient, it holds out a promise of performing valuable services.

“The basis of a durable power has thus been effectually laid, since this government has not only sufficient internal force and energy to establish and maintain order and create resources, but possesses such means of enterprise and defence as are calculated to protect it from aggression, acquire the respect of other nations, and secure its independence. In the accomplishment of this great work, Mehemet Ali has had the assistance of a compact and homogeneous population, full of intelligence, remarkable for its self-respect, strongly predisposed to enthusiasm, laborious though excitable, sober, contented, and obedient. In short, the people are ready to promote the interests of their country, and susceptible of any form or impression they may be required to take. The condition of the Christian population of Syria is favourable to the advance and stability of the new power, being assembled in the same district, well disciplined, sufficiently numerous to be useful but not to dream of independence, and so much in dread of Turkish tyranny as to be willing to draw tighter the bonds which connect it with the

government of Egypt. By attention to the interests of this people, it may be incorporated with the Arab state, and add materially to its strength."—pp. 101–106.

He adds, however,

"We should bear in mind that Mehemet Ali, through whose genius Egypt has acquired her present consequence, is far advanced in life, and that whatever may be the military talent of his son, he has hitherto given no proof of political sagacity, or of his fitness to govern an independent state. We should equally remember that Mahmoud has only one son, who is represented to be in a delicate state of health; nor should we forget that Mahmoud and this son are supposed to be the last male descendants of the blood of Othman. The death of the Sultan, or of the Egyptian viceroy, can therefore hardly fail to give rise to some important change, for which England should be prepared."—p. 306.

Mr. Elliott, to whose general accuracy and sound judgment we cannot confess too many obligations, and whose sphere of research has been wider than falls to the lot of the many, compares the position of Egypt and Syria under the Pacha's rule with that of Hindostan under our own.

"There may be, and doubtless are, some errors of legislation; but the difficulties to be overcome are at least sufficient to account for them; and perfection is not to be expected. Before the cultivator can be blamed, an estimate must be formed of the capacities of the field whereon he has had to labour; it must be ascertained whether the soil on which he has been compelled to rear his seed be adapted to it; and whether it could possibly have been made to yield a richer harvest. In like manner, if we would appreciate the skill and resources of those who have been called to redeem from the waste and to raise to a state of cultivation the vast political plains of Hindostan, we must first analyze the character of the people submitted to their rule; and then, if we judge rightly, we shall award them no ordinary meed of praise for the happiness and prosperity resulting to their subjects, and be very far from censuring them for the absence of that which no human legislation could have supplied. Here failure is attributable rather to the materials than to the workman: a more paternal or judicious government never held sway in the east, or one which afforded, on the whole, a degree of satisfaction bearing any proportion to that yielded by the British.

"It is one thing to find fault; it is another to point out a remedy, or to adduce a single case in which different means would have ensured better success. The conflicting interests of the various tribes under our government, and the dissimilarity of European

and Asiatic modes of thought and action render the difficulty of legislation for India very great; and this difficulty is much enhanced by the constitution of an authority which, instead of being independent and supreme, is itself subject to a higher power. When, it may be fairly asked, has any government so circumstanced succeeded equally well? A political paradox has been realized by the admirable administration of this *imperium in imperio*; and, whatever the defects it shares with every thing that is human—and they are many—it is not too much to say that few can be found, even among their adversaries, who will deny to the governors of that vast empire an anxious desire to promote the welfare of their subjects, or who will hesitate to admit that they have conferred on them unspeakable advantages.

"When the traveller compares the existing condition of India and Syria, the one with its Mussulman and Christian thousands, the other with its Mussulman and Pagan millions; when he sees the cruelties, injustice, and oppression of the government, with the lawlessness, and political and moral degradation of the people, under the Egyptian viceroy; and contrasts them with the mildness and justice of English rule, and the security and happiness of British Indians; he will not only wonder at what has been done for our Eastern possessions, but he will estimate more justly the blessings conferred on them by liberation from a Moslim yoke and the substitution of Christian sway.

"Notwithstanding much that is plausible, the policy of Mohammed Ali is assuredly a shortsighted one. He acts as if his sole object were, without consulting the interests of his people, or of his son and successor, to accumulate as much as possible during the year or two that may remain of a life already extended beyond the age of man. All classes of his subjects are alike disgusted. The Moslims think he does not pay them due regard as followers of Mohammed; they resent his encroachments on their privilege to beat and kill all 'Christian dogs;' and they are still more dissatisfied with his system of conscription, which has desolated the country. When a demand arises for soldiers, he not only decimates, but actually appropriates the entire adult male population of villages. In many of those through which we passed not a single male between eight years of age and the decrepitude of old age was to be seen; and the women forgetting their natural dread of the eye of man, the restrictions of their religion, and the shame incurred by such an exposure, ran out to make inquiries of us which none could answer. They asked, beating their breasts and giving vent to the bitterness of grief, in loud and lamentable cries, 'Shall we ever see our husbands, brothers, and sons, so cruelly snatched from us? Is our village condemned to desolation for some unknown crime? Are our crops doomed to rot on the ground? And are the powers of nature to be henceforth exercised in vain on untilled

fields?' In other places where the conscription has been less rigorously enforced, the men frequently addressed us in the language of alternate hope and despair. 'Why do not the Franks come to take possession of our country? We know they will conquer it soon. We are waiting for them. Why do they tarry so long?'

"While such is the discontent among Moslems, the rayahs, alas! have no greater cause to love their tyrant. What can be expected by others from the father who is merciless to his own? If ambition and self-interest united to a personal indifference towards all religions, have secured for the professors of Christianity some little consideration, that consideration is limited by the principle from which it emanates; and the moment it clashes with the oppressor's selfish views, the Christian is forgotten to be human, and treated like his fellow labourers on the soil, the ox and the ass. Thus extortion knows no limits. The peasants are left with the minimum of food and clothes requisite for life; and the first cry of 'Give, give,' which is answered by total destitution, is urged and re-urged with the thong of the bastinado. Elsewhere the curse is enforced, 'labour and the sweat of the brow;' in Syria it is labour, and starvation, and nudity, and a sweat of the blood."

"In England, Mohammed Ali and Ibrahim Pasha are spoken of as enlightened men, fond of Europeans and anxious to introduce civilisation among their degraded subjects; but a few days in Syria will convince an unbiassed mind that they are not truly enlightened, and that their apparent partiality for Franks is merely the result of a discovery that they can turn their superior knowledge to a selfish account. That they would by no means communicate to their people any light or benefit which may unfit them for being passive slaves, is proved by their obstinately maintaining, in spite of the remonstrances of England and the reiterated mandates of the Porte, a system of monopoly which is ruining Egypt and Syria, by compelling the natives to labour without wages, and by assigning to the pasha the hard-earned fruits of their industry. It is thus that the Macedonian slave has filled the coffers of the viceroy of Egypt; and from conduct such as this an estimate may be formed of his disinterested and enlightened mind. *Ex uno disce omnes!*"

The value of Syria is greatly enhanced to the two great contending parties by the recent discovery of coal in the mountains. The facilities thus afforded to steam communication with Europe are increased by the projected railroad from Kornal to Beyrout, a journey of eight hours, now performed on mules. Mr. Elliott gives the following idea of the value of the discovery.

"The discovery of coal in the mountains will increase the value of the iron in Leba-

non and Anti-Lebanon; and a furnace is about to be erected for smelting the ore. There is little doubt that iron works were carried on in this quarter by the Romans, as large quantities of scoria or slag are occasionally discovered at a distance from the mines, and generally near forests of ever-green oak, the wood of which was probably used for smelting, as the ore thus prepared is superior to that subjected to coal fires, because the metal becomes partially carbonated, and is therefore with less difficulty converted into steel, a purer carbonate of iron. It is a knowledge of this fact, with the consequent preference of wood for the purpose, that makes the Swedish iron peculiarly valuable; especially that of the mine of Dannemora, near Upsala, which is the best produced in Europe."

We have thought it right to bring this new acquisition pointedly before the reader, because it marks the commercial value of a country rising every day in importance in the political world. It is sufficiently known that Mehemet Ali has claimed not only Syria, but Adana and Tarsus also, as part of his projected sovereignty. We must give a few moments to this question.

To the first proposition of the Pacha for assured independence the answer of the four great powers was, their resolve to maintain the status quo. Mehemet gave way, but in appearance only. He had long been aware of the favourite proverb of Coumourgi, to hunt the hare in a waggon, and was resolved to run down his object steadily, though slowly. The intrigues and jealousies of the Turkish ministers offered him an advantage of which he was not slow in availing himself, and, having a large body of admirers and partisans at Constantinople, he easily contrived that their wishes should assume an audible tone, and that this should be carried to the impatient ears of Sultan Mahmoud. A few tamperings with Arabia and Mecca, the holy seat, and consequently the seat of religious influence over Islam; a gross insult offered to the deputation thence, and without reference to the Sultan as paramount Lord, precipitated a war,—by the exasperated orders of the latter, and the insults purposely offered to his troops by the Egyptians. That war lasted but a day;—the day that gave SYRIA, or INDEPENDENCE, or BOTH, to the Pacha of Egypt. His own skill had won the game, and foiled not only his master, but all the western powers at a single stroke. Well might he laugh at their beards.

His great point achieved, the Pacha was on velvet. Whatever occurred, he must keep some advantages—France was on his side, territorially from Algiers: England was

with him, commercially from the Suez communication: Russia upheld him, as weakening Turkey: and Austria, with her pendulous movement, would swing back to a certainty from beyond a given point, since she could not advance alone, and cling to her central principle of isolation from strife since the status quo was impossible.

We, as long since as June last, declared our conviction that a division of the Ottoman empire so far as Egypt was concerned, was necessitated by the mutual jealousies of Europe. The trade of the East must of necessity pass through two channels over land, if at all, to satisfy the eager and powerful nations of the West. As carriers, Turkey and Egypt would both be gainers, but the latter chiefly; and if allowed with her commercial aggrandizement and her hold in Arabia, to add Syria to it also, she must soon become more potent than her paramount. Yet this was a delicate question for Egypt; she actually held to Adana, with Tarsus, by right of conquest, as well as by investiture of the Porte as a vassal. But on the other hand, as a vassal she could not legitimate conquest, unless by absolute force; and this Europe was half resolved to prevent. France, through Syria, could gain direct access to the southern part of Asiatic Turkey, for commercial or military views, as suited best her own interests hereafter, and might open herself a road to Persia. If she could ever possess, or even influence, Egypt, this could be done far more easily, and attract far less jealousy and opposition, than when that possession or influence would affect Syria also. England, aware that Egypt might become the Turkey of France, was the more interested as to Syria; her harbours, it is true, were indifferent in the extreme; but steam supplied some, and the most material, defects. Syria was rising into hourly increased importance by the dispositions of Persia towards her ally Turkey; and the movements of the Egyptian force near Bahrein and Bassora showed the immense importance of a direct communication with the south and eastern portion of the Ottoman dominions; with Bagdad and with Armenia also. Russia, whose utmost views of aggrandizement southwards her most vehement impugnors confine, for the present, to Europe, or Asia Minor at farthest, could care little for the secondary province of Syria; at least not till Greece and its marine were her own. But to Turkey, Syria was vital; for its revenue and for its position:—maritimately, as flanking her Anatolian coasts and equalizing with Egypt the possession of the Levant; and militarily and politically, as the direct avenue from thence

to her important Pachaliks of the south, against which the Persian was already preparing a novel, or dreaming of reviving an ancient, claim; towards which also Egypt was advancing with the army of Hussein Bey; and which further, and in itself, was, in the absence or privation of Syria, but an indirect route to Arabia, of which the Ottoman's hold was at best but slender, and would soon cease from the vicinity and superior influence of Egypt.

A portion of Syria, perhaps as far as Jerusalem, might possibly, we conceive, be conceded to Egypt, so far merely as to ensure a ready access to Petræa; but a line much beyond this would cut off too much of Arabian communication to be submitted to by Turkey, unless in the last extremities: and while the Pacha is reducing the Red-sea coast, the station of Britain, near its extremity, at Aden, is not only a commercial and military position for the latter, as regards herself, but also a counter-check to Egypt in favour of Turkey; and a support in the same sense to the Imaum of Muscat.

While Egypt is too really master of Arabia to require the strengthening her position by possessing Syria, whose inhabitants detest her sway; and Turkey is too little master of that large peninsula not to need the preservation of her domains in integrity in that quarter, what can be thought of any serious claim of Egypt on Adana? Tarsus and the defiles of Cilicia are the southern gates of Constantinople: is the Turk to surrender the keeping of this into hands already more powerful than his own? The master of that position is the real lord of Asia Minor; and if yielded, the Pacha becomes the lord paramount, and the Sultan his vassal; or that of Russia. The reader who will consult Wylde's map of these countries and to Birmah, as coloured from their actual possessors, will at once recognize the truth; and perceive how the privation of the whole territory now in dispute isolated Turkey from her natural rights and from her allies, and that now it leaves her a territory as long and straggling, and as weak, as Italy; the ready prey consequently of any one of her neighbours or even subjects; the Russian, the Koord, the Persian, the Arab, and the Egyptian: all may not have the power now; but, the point once conceded, who shall preserve for her even the rich Pachalik of Bagdad?

If however the Syrian soil revert to its lawful proprietor, the possession of Cyprus is no less material for Turkey; for it is the maritime key of Syria and Adana, and in truth, of the whole southern coast of Asia Minor.

The harbours of Cyprus are the harbours of Syria in reality ; and the coasts of the former answering to the angle of both Adana and Itchil northward, and Syria to west, command the sea communication of both, and consequently guarantee the safety of the whole range from Asia Minor to Bagdad, from the West. This rich and lovely island is therefore most important to Turkey and Syria. If the cession of it is great for Egypt, so too is the Ottoman's cession to the Pacha of recognized independencies ; from a vassal to a king.

In the course of negotiations we have heard of a proposition on the part of Russia for consenting to wave her far-famed treaties with the Porte, if Britain would consent to the exclusion of all foreign ships of war from the Dardanelles and Bosphorus. We cannot believe that any such proposition could be seriously entertained, or as has been said of this, by the British Ministry ; for we have no hesitation in saying that an assent to these terms ought to bring any English Minister to the Block : and this not only for treason but incapacity. In truth, the loss of such a head would be of no less advantage to the owner than to the nation. The Black Sea, possessed by two powers, is an open sea ; and if Russia, England, and Turkey, were all to consent to the principle, not only would this be a waiver by Britain of her direct imprescriptible rights, immediate interests, and actual Eastern dominions, but a gratuitous folly into the bargain. Russia and Turkey conjoining to close the Dardanelles would be a practical exclusion for all nations ; but England in consenting would give up Greece to Russia. And for what ? The treaty of Unkiar-Skelessi has but two years of further duration ; and what, in the worst case, is the value of this ? But it cannot be forgotten that France promptly protested against that treaty, to the bitter mortification of the Russian government, as betrayed in their pert and indecent reply, which no one can have forgotten. Sir Frederick Smith's admirable remarks on the Dardanelles finally dispose of the silly bugbear which the Marquis of Londonderry has the merit of first exposing ; (see F. Q. R. Nos. XLIII and XLV.) but if England were weak enough to yield all interest in Circassia, and North Persia and the Caspian, she could not give away the rights of any nation but her own. France, that under Louis XIV. rejected at the treaty of Breda, even the name of British for the channel between the two countries, has formally reserved her rights, and would reserve them even without it. No nation without its own consent can be excluded from an open sea, like the Euxine.

The present expedition to Khiva, the first fruits of our vaunted Indian activity, show at least that Russia has no apprehensions near the Euxine. The really large force, 24,000 men, assigned to the expedition, is, however, not at all too large for its ostensible object alone ; and we have shown in a former number (XLIII.) that the Tatar tribes are no despicable enemies in their own land ; concerned too as they are in the plunder of the Russian caravans and the general insecurity of that part of the world. The male population of Khiva, as of all Tatary, may be fairly reckoned at four-sixths capable of bearing arms ; and the formidable steppes in the route are not be passed against those tireless enemies with any but a very large force. The necessities of Russian trade have compelled the measure undoubtedly ; waning as it was before that of England in Central Asia : (see our No. for April last,) it is still considerable. A single large caravan from Russia exports into Tatary goods to the value of £180,000 sterling, and consisting of iron, glass, cochineal, cotton, and sugar. Of this one-half the amount is actually Russian ; the rest in transit from Germany, France, and England ; in the order of their values. Smaller and more frequent caravans take about a sixth of the foregoing. The chief European nations therefore are interested in the suppression of the system of Tatar plunder.

The influence of Austria has been confessed by Russia in the increased means of communication she is making with the former by roads, rail-roads, and canals ; while her intercourse with Prussia is sternly watched by a cordon ; for the dread of Prussian principles, and these are lax enough, weighs heavy with the autocrat. We are no friends to Prussian manœuvres, as our Journal has proved ; and the recent correspondence between Lord Palmerston and the Baron Bulow justifies all our doubts of that insidious Power, of which even the partizans of the English ministry are now convinced. Prussia therefore is become jealous of Russia ; and would fain participate in the two Eastern questions, Egypt and Asia. The news of the expedition to Khiva has caused a great sensation at Berlin.

But as to the interest taken by England in this expedition we must devote a space. It may be no more than it professes to be ; a chastisement necessitated by the Tatars ; but can any one doubt that the moral influence of this movement, as well as the political, is meant to counteract that of Britain upon Cabool ? The duty once performed, the Russian troops are, according to the

formal proclamation, to return to their stations; as Russia has no design of aggrandisement nor conquest.

"But now every means of persuasion has been exhausted. The rights of Russia, the security of her trade, the tranquillity of her subjects, and the dignity of her state, call for decisive measures, and the emperor has judged it to be high time to send a body of troops to Chiva to put an end to robbery and exaction, to deliver those Russians who are detained in slavery, to make the inhabitants of Chiva esteem and respect the Russian name, and finally to strengthen in that part of Asia the **LAWFUL INFLUENCE TO WHICH RUSSIA HAS A RIGHT (!)** and which alone can ensure the maintenance of peace.

"This is the purpose of the present expedition, and as soon as it shall be attained, and an order of things, conformable to the interests of Russia and the neighbouring Asiatic states, shall be established on a permanent footing, the body of troops, which has received orders to march on Chiva, will return to the frontiers of the empire."

But who can answer for this? Like the Vicar of Wakefield with Ephraim Jenkinson, we think we have heard all this before. But supposing it to be really a march of conquest, and subjugation under the name of alliance,—for stay there the Russians cannot;—who can blame them? Have we not only furnished them with an answer to reclamations and remonstrances, but with a pretext too, if indeed they ever wanted one? Has not our ominous activity courted them into this effective, though indirect, counter movement? a cheaper and easier, as well as more efficient poise of moral influence over the wastes of Tataria, than all that war could effectuate against ourselves, and fairly disposing of all our dear-bought magnificences and our still more dearly to be bought experience hereafter in the East.

"The lawful influence to which Russia has a right in that part of Asia," is evidently, and almost avowedly, set forth as an intelligible hint to Europe and Asia also; and to the 24,000 men put in movement for the purpose of sustaining that influence may be added a reserve, if circumstances require it, of 20,000 more from the army of Caucasus, as we are expected to believe. We certainly believe nothing of the kind. The first-named force on paper may be reduced one-fourth effectively; and its columns, from the very nature of the country it has to pass through, consisting of salt and sand deserts, will be wide-scattering, and chiefly for want of water; but that a second force nearly equal to the former could be spared from the Caucasian range at this moment is in itself ridiculous; and they who spread

the report—it is no more—do not inform us how it is to be provisioned. We can positively affirm that there are no means for this in their actual location, and we entirely doubt the practicability of this as they advance in the present state of the neighbouring countries. If the Khan of Khiva adopts the Tatar warfare altogether, and is resolute, he will by no means become an easy conquest. But as to maintaining themselves in the conquered country against the enmity of the native races, it is a chimera that could be engendered by ignorance alone, and which can be exceeded only by the silly dream of bringing the aforesaid Tatars to invade our empire of Hindostan from "their traditionary accounts of the wealth of Delhi!" Children like pretty stories.

But all this additional preparation, or rather the noise of it, is part of the policy of Russia; and is but a continuation of those paper, and newspaper, movements by which Europe is kept in constant activity,—so far at least as the ears are concerned,—and forced into ceaseless recollections of the Czar. This great monarch has, as Mr. Bremner well observed, his hobby-horse; and if he likes to advertise his power, his promptitude, his armies, and their efficiencies, it is a very good thing for the foreign journals that are favoured with his care. We ourselves cannot help thinking that a weekly advertisement in the Times would do the work more efficiently, could that bold newspaper once win the Autocrat's affections. In the mean time, how dearly must we prize the fond and gratuitous affection of the French press, that is always so feelingly alive to the danger that threatens our Eastern possessions, and so active in pointing out every movement that might endanger it—save their own.

But in spite of all alarms now at the navigation of the Oxus extending to within a few days' march of Cabul, and which we suppose was much the same a month or two since, and before the Russian expedition advanced to Khiva; and notwithstanding it is now discovered that the advance by this route upon India is more easy than by Herat; leaving Russia to choose which she may of these brilliant novelties, our only recommendation would be that the British government at home should forbid the exportation of these French speculations to Hindostan. Think how the mighty soul of the Governor-General of India would be consternated at the awful intelligence! Imagine the usurper-general of Asia suddenly discovering that boats can float in a river 700 miles distant from his government! Why the horror of aggression that

fills that excellent man's mind would lead him at once to seize Persia, Tatar, and Thibet at least, in order to prove to the world the valour and disinterestedness of England. There is no reason on earth why Khorassan should not be overrun, and there are abundant claimants for the Persian crown. It is well the reigning Shah, who was to dine at the Government-House in Calcutta, change the cathedral into a mesjid, convert Bishop Wilson into a good Sheah, and restore the magi—has struck his colours to the great and "dangerous Archimage," in good time to save his own throne. But if a river is so alarming because it holds water, what must be a desert, that contains sand? Might not a gust of wind from the north-west bring columns of this to overlay the fertile plains of Bengal, and choke the rice-lands of Patna, overwhelm the dawks or letter-carriers from presidency to presidency, and sweep Lord Auckland's elephant train, like Bruce's camels, into the air? Surely these are sufficient dangers to warrant our marching upon Khorassan and the Caspian; and, since the object is to avoid unnecessary contact with Russia, take the Khan of Khiva under our protection and build a fleet upon the Aral. Lord Minto, we know, cannot spare even a yawl or jolly-boat from the imposing majesty of the British navy; but perhaps the Thames Yacht-Club would aid him in this emergency, and there is store of cannons and dandies about the reaches of Chelsea and Calcutta.

Count Bjornstjerna, to whose able work we long since introduced the reader, and who has done our journal the honour of adopting the arguments in Number XLIII, for October, 1838, in his work published the following spring,* and condensing them, with his confessed judgment and high military skill, into his six **CONCLUSIONS**, amongst the vast mass of additional and inestimable matter in that volume, has shown that it would require, even were all the means obtained, full four campaigns for Russia to invade Hindostan, and then only so far as the territories of Runjeet Sing; and even in this case that the force must be small and unprovided with artillery! The wisdom and necessity there-

fore of our Cabul expedition are manifest: and now that it is won, who is to keep it?

The affection shown by the Affghans for Britain formerly has changed, since the glorious expedition sent expressly for their good and to restore their idol Soojah, into something very like hatred, as our soldiers know to their cost by the desperate assassinations perpetrated. Will Soojah require to be maintained by British troops? and are all his quarrels to become ours? What are the communications of that country? and how is a chain of posts to be preserved at ten-fold expense every year against a hostile or at best marauding race of mountaineers, filling every pass and aware of all the fastnesses? The desperate game of Russia in Circassia and Caucasus is to be brought home to India! and this too while its resources are lessened by the loss of the fatal opium trade, which of late years the British government in India has **OPENLY ENCOURAGED** for the sake of its revenue. The addition of Cabul to British protection will be a serious thorn in the side of the Indian government at all points, and its difficulties of communication will doubtless necessitate the occupation of a part of the Punjab by the British, as a line of open ground from Delhi and Loodiana, possibly through Lahore, Jubalpoore, Horreah, and Bhira, into Affghanistan. Already it is discovered at Calcutta that the son of Runjeet needs our assistance; and it is therefore likely that he will obtain it, and no less likely that he will have to pay for it. All this is as it should be; no doubt. But where is it to stop? We answer, When nothing more can be got, and not till then. The modern Alexander is as scrupulous as his prototype, and will stay his career only when he cannot move. But with all his activity and vigilance beyond our territories, he could not see Karnoul within it; with all its fearful preparations, very sagely anticipating Russia and Dost Mahommed and the Shah in full march upon Bengal! What natives could have used the apparatus provided? Neither Indian, nor Affghan, nor Persian: only Russia—who never dreamed of it.

* A weekly journal of the highest character has made in September last a serious mistake, evidently by oversight, on this head; predating the Count's work by 12 months, as its own pages show. Compare its statement at page 606, col. 2. with the "*Note by the translator*," page 589, col. 2. Our information at the time was supplied by an actual spectator of the siege of Herat: and all his communications, and our judgments, have been fully justified by events.—Ed. F. Q. R.

We think enough has been said to show that the accusations of folly, precipitancy, injustice, and inconsideration in the government of India, have not been in the least affected by the gallant conduct of the British army in Affghanistan. If this is the chosen garden of Eden, we trust that its present noble occupant will not be thrust out of it from his longing for the forbidden fruit; and should he, by any fortuitous felicity, approximate at any time to the tree of knowledge, it is to be hoped that the leaves, however

desirable for his friends at home, may not form a ledger, or more properly a waste-book, of his expenses for the defence, as well as for the acquisition of the new territory.

The policy that England has been so sagely pursuing of late years in the East, is now producing returns such as might be expected from the sagacity of those new adventurers in the art of government. The Anglo-Indian administration has of late years, with characteristic honour and honesty, contrived to render the opium-trade, with all its iniquities, a source of support to the state,* and for this object have given it such direct encouragement as to make itself an absolute patron and partner in the crime and the profits. This source of revenue has been absolutely recognized by Parliament also at home; and when this nefarious violation of the laws of man and God was terminated by the resolution of the Chinese government, the instruments were left to suffer the loss they have deservedly incurred; but the Whig panders to those horrible, the most horrible, passions that degrade creation, play the fox as of old, and clear the wall at the goat's expense.

So petty rogues submit to fate.

But the question is no longer a matter of profit and loss; it is a reckoning of blood; and the slaughter of hundreds may, and probably must, atone for the gross blindness and shameful negligence of the British government. The India Company's trade was terminated; and though it was obvious to any but ministerial eyes that with the removal of a systematic and reserved form of mercantile intercourse many irregularities must ensue from the novices let loose into the China trade, no really effective, careful measure was ever devised to substitute the past restriction; the beautiful theory of a free trade was to be adopted, and China would imitate what Europe had spurned; China, the unchanging of every age! What signified the future to a ministry who held their seats by the day, and worked by the piece? Precaution would have been a clear tempting of Providence on the part of that pious man who has suffered Buenos Ayres, and Chili, and Mexico, and Turkey, and Egypt, and Russia, and Prussia, and France, and China, to do their will at their own pleasure, and leisure—while he has had his. The externals of policy he sagely considered irrelevant, and confined his attention solely to home.

* See a concise and valuable article on the Opium Trade in the present No. of the *Oriental Herald*.

"Ut flos in septis secretus nascitur hortis,*
Ignotus pecori, nullo contusus aratro;
Quem mulcent auræ, firmat sol, educat imber;
Multi illum pueri, multæ optavêre puellæ."

For the alleged insults, injuries, and degradations inflicted on British character and interests, if such they be, the British Parliament is bound to require explanation. The opium sufferers are turned off unceremoniously; and Britain must, we suppose, lose all the money incurred by our glorious successes over a miserable handful of frightened and powerless, though brave Ghaznevites and Affghans.

But how are we to prevent this new war with China? The moral force of a few vessels might have saved much, if not all, of recent outrages; but that very minister of the admiralty whose partizans charge neglect on the former English ministry, because, at a time when English energies were taxed to the utmost, and upwards of six hundred vessels were on service in every quarter of the globe, some could not be spared for the service of Spain—and this during an unexampled war—while a host of Whigs, with six vessels in active service, threw Turkey into the arms of Russia, because England could not spare another ship—this very minister, in peace, with not a tenth part of the above-mentioned force required, (as it is stated at least,) has left half Europe, all America, and China, to shift for themselves, without protection even from a single frigate! Of such imbecility what can be the result? And will Britain trust him as her minister of marine for another hour?

A war with China is not a jest; a fleet may cut off supplies and injure trade to a certain extent—not beyond it. The miserable junk-men and floating population of that country are outcasts by its laws. Their wrongs are merely their own: but if we are to make a serious impression on the Chinese government, it must be on land also: and how is this to be effected? Armies of some hundred thousand men each, though vanquishable in pitched battles, are troublesome by their very numbers, and their passive courage—their constancy in defeat. If we trade with the Chinese under their existing laws, what security is there that homicide may not again occur? If we desire to alter this, how is it to be done? Are we to join

* For the unlearned reader's gratification we endeavour to imitate the original of Catullus.

"So blooms in sheltered glades the unconscious Flower;
Reared mid soft airs, hot sun, and cooling shower;
Unharm'd by Shares; to vulgar Herds unknown;
Whom boys admire; and Maids have made their own."

the dethroned dynasty, with its millions of followers, and drive the Tatar usurpers from Peking!

The mischiefs of neglect already committed externally are known. A more serious point we now bring under consideration. It has been public and notorious, that experiments of a most formidable character, as to projectiles, have been made; that in England this has gone so far as to necessitate a great change in our defensive system. This has been confessed by those best calculated to judge; has been examined into scientifically, by official order, years ago. Certificates, couched in terms it would be difficult to surpass, have declared that the invention is far beyond any effort of imagination; that the existence of Great Britain depends on it; that the fate of the navy must go with it wherever it is carried by the inventor; royal sanction has been given; the royal signature pledged, and for years, to the individual. Every thing that words could promise, or incredulity require, has been exacted—and every proof demanded has been given, till doubt was converted into admiring consternation.

Why is this power, against which all resistance, even that of the strongest fortifications, is impossible, still unobtained for the country?

Is it to be allowed to go to other nations, for them to turn it at once against a country they envy, and would fain destroy? Where lies the obstruction then? Is it really in that one sole quarter where inactivity and imbecility have been so often, and so justly, charged of late? The Whigs boast of economy; and the saving consequent on adopting this invention is admitted to amount to millions; enough to pension off all those who might suffer by the change, and still produce a vast diminution of expenditure to the nation, as well as secure it against all contingencies for the future. Why then is all this thrown aside? Is it that the services of the present head of the Admiralty are so valuable, that even millions, annually saved, would not console the nation for his single loss!

CRITICAL SKETCHES.

ART. IX.—*Encyclopédie des échecs, ou résumé comparatif en tableaux synoptiques des meilleurs ouvrages écrits sur ce jeu par les auteurs français et étrangers, tant anciens que modernes, mis à l'usage de toutes les nations par le langage universel des chiffres.* Par M. Alexandre. Paris and London.

THIS, certainly, even as far as extent is concerned, is the largest, best, and completest work on that noble and ancient game. M. Alexandre's idea cannot be called other than original. He has extracted, by ten years of labour, the systems of the most celebrated players, and now lays them, in a synoptical form, before the student. Such is the plan of the work, and its practical utility is so tangible that we need not dilate on it farther: the labour of these crowded tables to the author is almost incalculable; and yet the book, with its long rows of numbers, letters, and signs, apparently so complicated, will not take half an hour to unriddle and understand completely. The author, moreover, has given an introductory game, in which this array of signs is thoroughly explained. The work is indispensable to every amateur of this pleasing science; and we have but to add, that among the subscribers to it are the most illustrious names of both France and England.

ART. X.—*Picturesque Architecture of Paris.* Folio. Boys, London.

THIS singularly beautiful work exhibits a series of plates, combining all the delicacy and effect of colours with the cheapness of lithographic impressions. The art is novel, and appears, at one step, to have reached a very high degree of perfection. The exactitude, finish, and beauty of the plates are exquisite, and invaluable to the amateur's portfolio.

MUSIC ABROAD AND AT HOME.

CHINA.

We have, in a previous Number, referred to the similarity existing between the Chinese Drama and our modern Italian Opera. A passage we met with in "Laou-Seng-Urh, or An Heir in his Old Age," translated from a Chinese Drama, confirms this view :—

"In comedy the dialogue is carried on in the common colloquial language, but in the higher order of historical and tragical plays the tone of voice is elevated considerably above its natural pitch, and continued throughout in a kind of whining monotony, having some resemblance to, but wanting the modulation and cadences of, the recitative in the Italian Opera ; as in this, too, the sentiments of grief, joy, love, hatred, revenge, &c., are, in the Chinese dramas, usually thrown into lyric poetry, and sung in soft or boisterous airs, according to the sentiment expressed and the situation of the actor : they are also accompanied with loud music, the performers being placed at the back part of the stage.*

"Whatever may be the merits or defects of the Chinese Drama, it is unquestionably *their own invention*. The only nation from whence they could have borrowed any thing is that of Hindostan, from whence they imported the religion of Budh."

There are pieces, the songs of which are difficult to be understood, especially by Europeans, because they are full of allusions to things unknown to us, and of figures of speech which we have much ado to comprehend ; for the Chinese have their poetry as we have ours. The airs or tunes belonging to the songs are but few ; and in the printed copies to every song the tune is prefixed. These songs are printed in large characters,

to distinguish them from the other parts of the dialogue.

An account of a Chinese Dance will prove that this antediluvian nation held some very philosophical notions of the character of certain instruments :—

"The Dance of *Ou-ouang*, a native of one of the northern provinces of the empire.

"The dancers advanced from the north. Scarce did they commence a few steps, before, on a sudden changing the order in which they came, they threw themselves into the figure of combatants, expressing, by their attitudes, gestures, and evolutions, an order of battle, and the fate of the conquerors and conquered. In this they represented *Ou-ouang*, who gave battle to *Tcheou-ouang*, defeated him, and remained master of the empire, by extinguishing for ever the dynasty of the *Changs*. Long before the dance, and to prepare the spectators for the music, the drum was beat, by way of *alert*, in the fear that they might, at the bottom of their hearts, be taken up with some sentiment contrary to that with which it was proposed to inspire them ; and it was by the sound of the drum that they were insensibly disposed to take the proper impressions. At the beginning of the dance there were certain passionate gestures, used with the hands and feet. This was particularly designed to divest the spectators of the compassion they might have for the sad fate of *Tcheou-ouang*."

Compare this with the description in Burney (vol. i. p. 465) of the Roman dance *Salii*,* established by Numa. The only difference seems to be, that the Chinese dancers were spared the exertion of singing during the dance ; while the Roman saltatores, in dancing, *sang* certain hymns, after the manner of their country. Thaletes the poet, musician of Crete, (according to the Scholiast on Pindar,) was the first who composed

* Their notions of the *secondary* importance of accompaniment were therefore much more correct and philosophical than ours. Surely it will strike any unprejudiced person, that theatrical delusion is often marred by the sight and obtruding noise of an unequal or ill-matched orchestra. In solo accompaniments the effect is astonishingly improved when the player is not seen.

* The *Salii* were originally twelve in number ; their chief was called *Præ-Sul*, which serves to show that they were properly *Sul-ii*, priests of Sol. Their officer was called *Vates*, a musician, and they were in reality all *Bards*.

the *Hyporchemes*, for the armed or military dance ; but the dance itself, as we see by the foregoing account, was an invention of the Chinese.

HINDOSTAN.—The impressive title of one of the most ancient Sanscrit treatises on music is “The Sea of Passions.” Each note in the scale of their music is under the protection of a divinity.

Hindu Scale.

Sa . Shadja (pronounced Sarja, or Kharja.)
 Ri . Risabha (pronounced Rikhabh.)
 Ga . Gandhara.
 Ma . Madhyama.
 Pa . Panchana.
 Dha Dhaivata.
 Ni . Nishada (pronounced Nikhad.)

The complete scale *Swaragrāma*, or assemblage of notes, is likewise a Septac or Heptachord of seven notes. The Hindus place the seven notes under the protection of seven Adhishthātri Dévatās, or superintending deities, as follow :—

Shadja . . .	under the protection of Agni.
Risabha . . .	Bramha.
Gandhara . . .	Sarasvatī.
Madhyama . . .	Mahādeva.
Panchana . . .	Sri or Lacshim.
Dhaivata . . .	Ganesa.
Nishada . . .	Surya.

Of these notes there are four descriptions : 1st, the *Bādi*, which is the Ansa or key-note, and is described as the Raja on whom all the rest depend ; 2d, is *Sambadi*, which is considered as the Mantin, or principal ministers of the Raja ; 3d, *Anubadi*, described as subjects attached to their lord.

The Indian Vedas are never read, but sung or chanted.

The Minnesängers of Germany, the Troubadours of Provence, and the Improvisatori of Italy, are nothing but imitators of the poor Penang boatmen, who for ages practised the same extempore effusions. See Wilkinson’s “Sketches of Chinese,” p. 90 :—“The manners of the inhabitants are very simple and harmless. Upon entering one of their boats you immediately become a subject for their panegyric and eulogium, and every part of your dress is severally described and sung in chorus by the sable songsters, in their savage *polacca* ; which, although possessing more discord than harmony, has a kind of melancholic dissonancy, not altogether displeasing to the ear.”

TURKEY AND THE MEDITERRANEAN.

CONSTANTINOPLE.—The young sultan has

not alone forbidden wine throughout his dominions, but even music ! But the taste for the magic god has, within the last two years, spread so rapidly throughout Turkey, that the sultan’s command has gone forth unheeded ; and the Turks will assuredly never abolish music, however they may discountenance wine.

CORFU.—During the spring and early part of the summer, Meyerbeer’s ‘Crocato’ has had a long run ; Rossini’s ‘Semiramide’ and his ‘Barbière di Seviglia’ have also enjoyed a share of the public approbation. Donizetti’s ‘Lucia di Lammermoor’ was brought out expressly for our ‘prima donna,’ M. Therese Menghini ; in which, and in ‘Crocato’ particularly, she enraptured the audiences who flocked nightly to hear her enchanting voice ; but she is now lost to the world—she died in August, deeply and sincerely regretted by every lover of music.

ALGIERS.—A series of popular operas have been produced here, under the superintendence of Gerli, the bass singer. They commenced with Ricci’s ‘Esposi, Cenerentola,’ and Donizetti’s ‘Torquato Tasso’ ; but these did not succeed for want of an efficient ‘prima donna.’ Mdlle G. Leva was then sent for from Milan, and triumphantly succeeded in Donizetti’s ‘Lucia di Lammermoor’ and in Bellini’s ‘Norma.’ Gerli then produced, for the first time, his new opera, entitled ‘Il Sogno Punitore,’ which fully succeeded until the close of the season.

Some little disaffection arose among the French party, who desired that French and Italian operas should be played alternately ; but it was at length decided by the committee that the Italian opera should be produced alternately with French vaudevilles. The Buffa-Mantegazza has obtained a six years’ licence from the French government in Algiers, with the aid of 12,000 francs, and the sole privilege of producing operas and plays ; and further, that all persons opening other theatres in Algiers are to pay him one-fifth of their proceeds. Under these auspices he has gone to Italy, and is shortly expected from Milan, bringing some of the most talented singers with him.

ODESSA.—The only music in full favour here is the Italian. The musical direction of the opera is under the leadership of F. Grini, from Florence ; the first violin is E. Boussier, from Leghorn, and the first violoncello Strinasacchi. The operatic singers are principally from Milan : Maria Frisch is the ‘prima donna ;’ she gained great applause in ‘Anna Bolena.’ ‘Catterina di Guisa’ was produced here the beginning of October, for the first time, and found great favour : the other favourites are ‘Son-

nambula,' 'Otello,' and 'Torquato Tasso.'

RUSSIA.

ST. PETERSBURG.—A. Adam has arrived at this city, and is engaged in the production of a new opera composed by himself, which will speedily be produced at the Royal Opera House. De Beriot, accompanied by Benedict, is daily expected; they gave a concert at Stuttgart, which was very fully attended. Taglioni appeared in a ballet entitled 'L'Ombre,' in which she dances on a lake, and then vanishes. The Emperor sent her a handsome ornament studded with diamonds and turquoises.

The Russian Theatre witnessed the appearance of singular talents in the person of Temenoff, who, having had no prototype, has unhappily left no successor. The credit of the Russian Theatre at St. Petersburg is materially owing to the assiduity of the distinguished dramatic writer Prince Schachofskoj. A collection of four thousand popular Russian songs by Kirijewski will shortly be published.

In the empress's establishment for the education of noblemen's and other children, they cultivate music. "On entering the dining-hall we found all the nobles assembled. They immediately struck up the 'Hymn of Grace,' their numerous and fine voices producing a magic and divine effect.

"The national concert has its peculiar instruments, in shape precisely like a wooden spoon, the upper part ornamented with bells, similar to a child's coral: two of them are held in each hand, and played precisely like castanets, and are accompanied by violins and clarionets. The vocal music is most extraordinary, ringing the changes with inconceivable rapidity, sometimes shrill, then low and plaintive, succeeded by boisterous sounds, absolutely deafening. The spoon or castanet performer was supposed to be recounting to his companions his mode of endeavouring to soften an unkind and obdurate mistress; the words were said to be strong and persuasive, partaking alternately of hope and despair; and they were accompanied with such gestures as made the whole intelligible to us."—Captain G. Jones's 'Travels in Norway, Russia,' &c., 1827, vol. ii. p. 72.

"The musical instruments of the Russians enumerated and described by Guthrie are,—1st, 'The Rojock,' a rude species of 'Chalumeau' or mountain horn: it seems to be nearly the same as the shepherd's pastoral pipe of Theocritus. 2d, 'The Dudka,' a primitive kind of flute, similar to the one

mentioned by Horace: 'Tibia non ut nunc aurichalcho vincta tubæque Emula, sed tenuis simplexque foramine pauco Adspirare adesse choris erat utilis.' &c. 3d, 'The Gelaika or Sipooka' is a species of double flute, very similar to that of the Greeks. 4th, 'The Swirelka,' a Syrin or Pan's pipes. 5th, 'The Rog,' a species of horn or Corno de Caccia. 6th, 'The Pilai,' a 'cornmuse' or bagpipe, undoubtedly wearing the primitive form of that instrument of 'rude melody.' 7th, 'The Balaika, a most ancient species of Russian guitar, of two strings. This well-known instrument to the ancient and modern Greeks was found sculptured on an Egyptian obelisk, supposed to be the work of Sesostris (it was thrown down in 1527, when the Duke of Bourbon took Rome), and lies now in the Campus Martius. The exact similarity between this old Egyptian instrument and the Balaika will enable us to judge in some degree of the very great antiquity of the primitive species of Cythera. 8th, 'The Goudok,' the most antique kind of violin, and most probably, from its construction, the parent of the modern instrument of that name. 9th, 'The Gousli, or horizontal harp, not unlike in shape to what we now call the dulcimer. 10th, 'The Loschki' seems to be a modification of the ancient 'Sistrum.'"

ETRUSCAN MUSIC.—With respect to Etruscan music, whoever regards the great number of instruments represented in the fine collection of antiquities published under the patronage of Sir William Hamilton, as well as those at Rome by Passerio, must be convinced that the ancient inhabitants of Etruria were extremely attached to music. They were the inventors of the 'Versus Fescennini,' so called by being first used by the people of 'Fescennia.' Every species of musical instrument that is to be found in the remains of Greek sculpture is delineated on the vases of these collections, though the antiquity of them is imagined to be much higher than the general use of the instruments represented upon them was, even in Greece.—See Burney, vol. i. p. 471.

Holy women served in the temple, and an unmarried girl, called 'Canephoros,' or basket-bearer, began the sacrifice, besides chorusses of virgins, who hymned the goddess in songs of their country. Strabo, 'De Bello Punico,' says in express terms that the public music, especially such as was used in sacrifices, came from Etruria to the Romans.—See also Livy, lib. 39.

Godfrey Higgins, in his Anacalypsis, p. 373, states it as the belief of Niebuhr that the Etruscans once used a symbolical writing, and afterwards transcribed their narratives

in more modern characters. Le Comte L'Etoile has in his possession a number of ancient MSS. of Etruscan music, as it is said; if they are genuine, they are the rarest musical curiosities extant.

SPAIN AND PORTUGAL.

SEVILLE.—But two operas seem to have fully succeeded of all that have been produced during the summer and autumn, and those were Donizetti's 'Torquato Tasso' and 'I Puritani.'

LISBON.—Operatic performances are at a low ebb. The only successful opera of late has been Herold's 'Zampa,' which was brought out with great pomp and splendour in the decorations.

OPORTO.—M. Ribas, the Flutist, from London, who is a native of Portugal, lately gave a concert at the Theatre there, which was extremely well attended. He is a deserving man and clever artist.

HOLLAND.

The Dutch Society for the Improvement and Diffusion of Music has published an important and elaborate work, from the pen of J. Fenny, consisting of a grand "Sinfonie," which is dedicated to Cherubini, and has been so highly spoken of that the Society have agreed to bear the whole expense of publication.

LA HAGUE.—Döhler's concert, which he gave a short time ago, was crowded with his admirers.

POLAND.

WARSAW.—There appears to be no musician of eminence residing in Poland, if we except Ernemann; nor have we had any of late years, for Chopin and Wolf soon left their native country, and the late Prince Radzivil cannot be taken into account, from his long separation and residence in foreign countries. The latest artists of note in Warsaw are Elsner, Kurpinski, and Felix Dobrzinski: the latter is preparing a grand opera for the stage. At the theatres there is nothing produced but what is considered as fashionable at Paris; 'Der Freyschutz, Preciosa, Cenerentola, Masaniello, and Robert le Diable' being the only favourites. In the concerts there is equally a total absence of Polish music, and but little German. For some years no "Sinfonie" has been produced, the entertainments consisting almost entirely of French and Italian overtures.

GERMANY.

It is currently reported that Seidelmann,

the actor, will visit London shortly with a German company.

VIENNA.—A new comic opera has lately been produced by Dessauw, entitled 'A Visit to St. Cyr,' and met with great applause; comic operas from German musicians being considered here a great novelty.

On the 7th and 10th of November, Mendelssohn's oratorio of 'Paul' was performed in grand style by 1027 vocal and instrumental performers. This vast orchestra was composed of the following chorus: sopranos, 270; altos, 160; tenors, 160; basses, 160; and Instrumental:—59 first violins, 59 second violins, 48 violas, 41 violoncellos, 25 double basses, 12 flutes, 12 oboes, 12 clarionets, 12 flageolets, 2 double flageolets, 3 ophicleides, 12 horns, 8 trumpets, 9 trombones, and 4 kettle-drums. His majesty the emperor and all the court honoured the performance with their presence. The composer, Mendelssohn, was invited to Vienna to direct himself; but some private arrangements would not admit of his absence from Leipzig.

Liszt, De Beriot, and the tenor Poggi are here. Dreischoek, the rival of Thalberg, is leaving for Paris.

The Society of Friends of Music, in the Austrian States, lately performed Mendelssohn's Oratorio of St. Paul; the programme for the other two days' performances consisted of Cherubini's Requiem, and Spohr's "Der Heiland's Letzte Stunden" ("Our Saviour's Last Hours"), which has only been performed at Cassel, Dresden and Norwich.

BERLIN, December.—Herr Müller, from Brunswick, has given several concerts in this town, in conjunction with the celebrated pianiste, Clara Shleek. The former has much merit as a violin-player; the latter received universal applause in her execution of some of the most difficult of Thalberg's pieces. M. Rume, a Belgian violinist, and director of the Conservatoire at Liège, has also been staying here, and intends giving one or two concerts.

A new play, in five acts, was brought out here on the 20th of November, entitled Albuno und Wecksel. It is evidently written with a reference to the present state of society, but was not universally applauded. The author is as yet unknown.

Miss (not Fraulieu) Robena Anna Laidlaw, pianiste to the Queen of Hanover, is going to Vienna, having created a great sensation at Berlin and Frankfort.

The Royal School of Music in this city, founded in 1834, gave a concert lately, performed by the pupils. The celebrated mass by Palestrina known by the name of the

"Missa Papæ Marcelli," the choruses in Naumann's Oratorio of "David," some pieces from "Alceste," by Lulli, Bach's Duet for two piano-fortes, and some pieces from Mozart's "Idomeneo," were performed with great effect. Haumann, the violinist, is studying here.

Spontinus Vestalin was played at the opera for the hundredth time on the 6th of October.

LEIPZIG, December.—Madame Camille Pleyel gave three concerts here: her talents as a pianiste are highly spoken of. At Dresden she was likewise greatly applauded. She is now on her road to Vienna.

The Subscription Concerts, under the judicious management of two such celebrated musicians as Mendelssohn and David, maintain their justly acquired celebrity. Madlle Murti from Rusnuf, and Fraulin Schloss from Dusseldorf, are the prominent vocal performers during the present season.

Great progress has been made in this country in the manufacture of piano-fortes. Breitkopf and Härtel of this town, following the plan of Broadwood & Co., and Schambach & Merhaut, those of Collard & Collard, they are reported by competent judges to be equal to the English, which cost £45, and can be purchased for about twenty-five guineas. Mendelssohn has composed a new grand psalm, which will shortly be produced.

FRANKFORT.—A collection of posthumous pieces of vocal music, entitled "Joseph Gersbachs Liedernachlass," has just been published here. They are short choral songs, or sacred melodies, chiefly in 4, 5, and 6 parts. The best are No. 48, "Abendlied," for six sopranos, No. 77, "Sehnsucht nach dem Tode"—the others are so short and devoid of interest as not by any means to sustain the character that this class of German part songs generally maintains. But these "sweepings of the study" are, as in the case of Mozart's "Zaïde," the most unfair tests of any composer's ability.

The pianist Rosenhain has presented the Mozart Memorial Committee, at Frankfort, with an excellent piano-forte composition, which will shortly be published at Leipzig.

MUNICH.—Mozart's celebrated opera of "Don Juan" was recently produced at the King's Theatre, with the original finale to the second act; the theatre was unusually crowded, and the opera passed off with enthusiastic applause. Everywhere this opera is an evergreen when well got up.

Ole Bull has been here and given six concerts; from hence he proceeded to Stuttgart and Paris.

WEIMAR.—Young Walter von Goethe,

the grandson of the great genius of that name, who has studied music under Mendelssohn and C. Loewe, has composed a new opera. The libretto is from a poem by Theodore Körner, and some of the scenes are represented as showing a great field of melody. It will be produced almost immediately at our theatre. He has also another opera in a state of forwardness, which will be probably brought out at Vienna.

December.—Grillpaizer's comedy, *Weh dem der Leigt*, is more remarkable for its pure poetical diction than for the humour and comic scenes which we expected to find in it.

A new opera entitled *Mitternacht*, composed by Chelard, Maitre-de-Chapelle at Munich, was performed here lately: it has many fine passages, but is a little too noisy.

Anselmo Lancia, an opera in one act, after the poem by Theodore Körner, was produced here by Walter von Goethe, grandson of the poet. The music hardly satisfied the expectations of an indulgent public.

DRESDEN.—The Chevalier Morlacchi is occupied upon a new opera for the theatre at Venice. M. Chelard's "Macbeth" is in rehearsal at our theatre under the composer's direction.

STUTTGARD.—The long expected "Life of Beethoven," by A. Schindler, will be published by Cotta next Easter, and will form one volume, consisting of twenty-four sheets.

Benedict's new opera, "Gomez," has been performed with success.

HANOVER.—Prince George, the crown prince of Hanover, has written a musical pamphlet, entitled "Ideen Betrachtungen über die Eigenschaften der Musik." It has been just published by Helwing of Hanover.

POTSDAM.—But few operas are produced at the theatres in this town, ballets and comedies being the chief productions. A treat was offered recently to the musical inhabitants by the production of Auber's "Black Domino" at the King's Theatre, which met with such rapturous applause that it is to be followed by a series of Italian and French operas.

OFFENBACH.—The posthumous opera of Mozart's "Zaïde" has been published. The curiosity of all musical people having been strongly excited to know whether this composition, appearing so long after the composer's decease, be genuine, (M. André says it was composed in the year 1770,) has induced us to peruse it with all the interest that a long-cherished admiration of this great musician could excite. But we regret to say, the feeling of bitter disappointment that assailed us after closing the piano-forte

score was very great. There is not one single passage in the whole opera that can be of the slightest benefit to Mozart's reputation; and believing, as we do, the history of its production as related in the Preface, we must say that no advantage can accrue to any person, imbued with the true musical feeling, in being forced to observe how *little* great composers can sometimes become, when they are set to work upon an inefficient and trite story. It appears that Mozart undertook 'Zaïde' (whose libretto is similar to, but not so effective as, 'The Seraglio'), but left it unfinished for the last-named opera. By 'Zaïde' lying so long unnoticed among his papers, it is evident the composer very wisely thought nothing of it excepting as a mere exercise for his pen. The musical phrases throughout are quite common-place; there is no approach to anything like his fine style, excepting in the song by Soliman beginning 'Der Stolz leu,' which reminds us of the magnificent tenor song in 'Idomeneo,' 'Fuor del mar;' but it is a mere shadow of that fine composition. The overture is effective, and so is the finale; but these, we believe, were not in the original MS. Altogether we could not but think of the sensible advice given to a rising composer by an old and clever writer:—'All those pieces you write merely for exercise, and do not think highly of, for your reputation's sake tear them up, and put them into the fire with your own hands.' 'Zaïde' should have been Mozart's holocaust.

BRUENN.—De Beriot has given a concert here, which was well attended.

PESTH.—Such was the excitement which Jenny Lutzer's performance in Halevy's 'Jewess' occasioned, that the people, after the performance, took the horses from the carriage and drew her to her hotel. The enthusiasm was equally great on her departure, the following day, for Presburg, her native town.

HALLE.—Seidelmann, the famous tragedian, has been performing in the characters of Cromwell, Mephistopheles, &c., and has given universal satisfaction.

BONN.—We lay before our readers a letter which M. Liszt has just sent to the committee for Beethoven's monument; to the propositions of which they immediately consented:—

'Gentlemen,—As the subscription for Beethoven's Monument goes on but slowly, and consequently the execution of it is deferred to an indefinite period, I have the honour to make you a proposal, which I hope will suit you. I offer to make up the sum necessary for the erection of a monument to Beethoven, and only ask the privi-

lege of appointing the artist to whom to confide this work. It is M. Bartolini, of Florence, whose works are well known to you, and whom Italy honours as her greatest statuary. In an interview which I had with him on the subject, he assured me that the monument in marble (the cost of which would be from 50,000 to 60,000 francs) might be finished in two years, and that he was quite ready to set about the work immediately.

'Signed.

F. LISZT.'

The amount already subscribed is not more, we believe, than three-fourths of the amount; so that M. Liszt's share will not be a trifling one that he offers with such generous feeling to this excellent purpose.

ITALY.

ROME.—The list of those elected as honorary members, at the last sitting of the academy of the Holy Cecilia, contains, among others, the following distinguished names—

Honorary composers—Louis Spohr, L. Cherubini, K. Aiblinger, Count M. Carafa, Count S. Neukomm, G. de Conti Onslow, F. Morlacchi, G. Donizetti, S. Mercadante, P. Auber, H. M. Berton, Charles A. Adam, L. Confidati, C. Zanotti, C. G. Rocca, L. Bartolotti, G. Cecchini, and R. Benedetoni.

Instrumental composers and professors of the piano—K. Czerny, J. P. Pixis, T. Labarre, S. Thalberg, and F. Liszt, who has so handsomely offered to make up the deficit in the funds for the Beethoven Memorial at Bonn.

Honorary singers—Mary Hanbury, an English lady, Giuditta Pasta and Giuditta and Giulia Grisi.

17th Oct.—The Christinos performed last week in their church a solemn mass to celebrate the return of peace. They were not allowed to celebrate by a 'Te Deum' the victory gained over Don Carlos.

FLORENCE.—The Musical Festival which has just been held at the Palazzo Vecchio is described as exceeding any festival ever held in Italy. The performances consisted of Haydn's 'Creation,' which was given by 563 performers, to an audience of upwards of 4000 persons. The choir consisted of 360, of which were 60 sopranos, 90 tenors, 40 contraltos, and 120 bass voices, and 50 masters. The orchestra contained 70 1st violins, 20 2d violins, 16 violoncellos, 18 double basses, 8 flutes, 6 oboes, 10 clarionets, 14 bassoons, 14 horns, 8 trumpets, 9 large trumpets.

MILAN.—Mrs. Alfred Shaw has made a successful *début* at the Theatre La Scala in

an opera by Verdi, a new writer. She certainly has one of the finest contralto voices in Europe, with the requisite strength of constitution to bear the wear and tear of public singing. There is little doubt she will have a successful career.

There is an able article on the *Music of Italy* in the seventh number of 'The European,' a new weekly paper, taken from an article in the 'Allgemeine Musikalische Zeitung,' evidently emanating from a person of sound musical knowledge and good taste. The following remarks may equally apply to the French as to the Italian modern school of operatic writing: 'Every now and then compositions make their appearance, devoid of the least glimmering of genius, written without forethought, crammed with reminiscences, beset with nonsense, overloaded with dull instrumentation, and, by way of crowning grace, performed by young *artistes*, who, to the *taught* errors of the *maestro*, add their own blunders of intonation.' These things must go on so, until men of money, of sense, and firmness, undertake the onerous situation of managers, and it may well be asked who with such qualifications would venture upon this sea of troubles?

Louisa Crell, of Vienna, who is at present a dancer at the Milan Opera, bids fair to become a rival to Taglioni and the Elslers.

Donizetti is now composing six operas, two for the Grand Opera, two for the Opera Comique, and two for the Théâtre de la Renaissance at Paris. These six productions will be finished in the course of a year, and the half are already nearly so.

VENICE.—Rossini is to winter here. There is an idea that he will write an operetta in the Venetian dialect; this would be a novelty, and we have often been surprised that it has never been attempted by any of our first-rate composers. Any one who has read those comedies of *Goldoni*, and others in that racy and admirable *lingua provinciale* will acknowledge its complete fitness for the Opera Buffa.

ROSSINI, a few days before he left Barba-jà's villa, situated near Naples, writes thus to a friend, in reply to the report that he was composing a new opera, entitled 'Giovanno di Monferrato,' "io ho finito" (I have finished,) and further adds, "for whom shall I compose, seeing you have *no singers*?" This corroborates what Laporte stated in the first opera bills of last season.

TRIESTE.—The *teatro grande* opened about the middle of September, with Donizetti's 'Lucia di Lammermoor,' Mlle. Ungher sustaining the principal character: Two

new operas are in preparation, one composed by T. Lickl, the other by Otto O. Nicolay, both of whom are Germans.

FRANCE.

PARIS.—A new opera, entitled 'La Jacquerie,' composed by a young writer named Mainzer, was represented lately at the Théâtre de la Renaissance with success.

M. Berlioz's new symphony, founded upon the tragedy of 'Romeo and Juliet,' interspersed with vocal solos, chorusses, and prologues, is spoken of in the highest terms by the 'Revue et Gazette Musicale,' (a musical periodical published twice a week in Paris, conducted by a committee of professors.) The *scherzo* movement in particular, which describes the dream with Queen Mab, has a curious and original effect. At the Opera Comique, an opera, or operetta, in one act, entitled 'La Symphonie,' composed by M. Clappison, introduced Marie, the new tenor. 'Les Travestissemens,' another opera, in one act, the music by M. Grisar, has appeared at the same theatre, but there is nothing remarkable in it. French composers are springing up hourly like mushrooms, but the *previous study* to render themselves masters of their art appears not to be their forte. M. Ruolz has produced his new opera, in three acts, 'La Vendetta.' The chorus of Voltigeurs is effective, so is the prayer and chorus 'Quels veux.'

A Mass in German, by the late Carl Maria Von Weber, is reviewed in the Gazette Musicale; we have not yet seen, but can have very little doubt of what description of variety, imaginative melody, and fine expression of the words; this favourite exercise of all the great writers would exhibit, when touched by the original pen of such an inspired composer as Weber proved himself to be in every department of his art.

'Etudes sur le Texte des Psaumes,' 4 vols. 8vo. Par M. Nolhac. Paris, 1839.—The object of this work is chiefly to show the true method of ascertaining the sense of many parts of the Psalms, by examining the manner in which they were sung in the Temple. This is treated in a preliminary Discourse, noticing the union of music, poetry, and dancing. Numerous philological and critical notes, displaying much learning and research, contribute to render this a most valuable work to the curious in ancient musical studies.

'Hymnes sacrées.' Par M. Tarquety. Music by Berlioz. 8vo. Paris, 1839.—There is nothing particularly interesting in this work, save the musical portion by M. Berlioz. He is a musician evidently of an independent turn of mind, with great powers

of invention, seen even in these hymns; short as most of them are, still the master-hand cannot be concealed.

The music in Halevy's opera, 'Le Shérif,' is all extremely light; but pleasing.

A professor of physic of the college of St. Corbigny, in France, has invented a new double bass instrument, which is played like a violin with a bow, but the left hand works upon a set of keys, which brings out passages of such peculiar power and sweetness, with so much ease and facility as have never before been heard.

A. Thomas has composed a requiem, which is much praised for clearness and pure church music. Thomas is a pupil of Lesueur, who instructed Berlioz.

Theatrical Pieces in Paris.—During the month of November, at the twenty-five theatres open nightly, forty-two new pieces have been given, thus subdivided:—one comedy, one comic opera, nine melodramas, twenty-eight vaudevilles, burlettas, and comedy vaudevilles, and three pantomimes.

ARRAS.—The Philharmonic Society of Arras will perform at the festival of St. Cecilia a solemn mass, composed by M. A. Elwart, which was heard at Paris last Easter. We cannot too much applaud the zeal with which the Philharmonic Society pursue such serious musical studies, and we are glad to see that this is the second time that a sacred composition of M. Elwart has been performed at Arras on a like occasion.

ROUEN.—An opera in two acts, words by M. Bunot de Gurgy, the music by M. Elwart, is rehearsing at the theatre at Rouen. The committee of Rouen, who expect to succeed, spare no expense to render the piece in the scene of the 'Catalans' extremely brilliant. The principal characters will be supported by MM. Wermelen, Maillet, Boulard, and Mr. Felix Melotte.

ST. MALO.—The festival of St. Cecilia was celebrated with a mass composed by M. Nelet, which is highly spoken of as a scientific and beautiful composition.

GENEVA, 10th Oct.—M. Paganini, who has been staying at Geneva, his native town, for the last week, having arrived from Marseilles, had a severe nervous attack, which has decreased a little, but is still an object of anxiety to the numerous friends and admirers of this *great artist*.

PERIGUEUX.—The Municipal Council have just determined on a measure which ought to be cited and imitated. They have decided that six children of the choir of the Cathedral, belonging to the least wealthy families, shall be admitted gratis into the College. By these means they gain two points, since, besides the benefit of a certain

and complete education to the poor children, they contribute to spread amongst the pupils a taste for the study of vocal music, by making some of these young choristers monitors for their schoolfellows.

SWEDEN.

"Frithiof's Saga. A Legend of the North." By Esaias Tegnér, Bishop of Wexiö, in Sweden. Translated from the original Swedish, by G. Stevens, with Engravings, Musical Accompaniments, &c. Stockholm and London. 8vo. 1839.—This work, which ranks high as a literary curiosity (being an epic poem of great scope and variety of metre), is founded upon one of the most ancient of the Scandinavian legends, relating to the deeds of "Frithiof the Dauntless," a noble warrior, who lived previously to the close of the eighth century. This is the fourth *English* translation that has appeared, and is well executed. Some clever lithographic engravings, and twelve ballad portions of the cantos, set to music by Crusell of Stockholm and others, are additions that render this translation the most complete of any we have read. The spirit and nervous energy that distinguish the poetry of many of these are admirable; and when the great difficulties that lie in the way of *literal*, yet *easy-reading* translation, are considered, the translator deserves much commendation for his dexterity in steering so well between the two impediments.

The musical adaptations are extremely characteristic and well arranged; in style they resemble the German "Lieder." The "Viking-Code" (a sort of digest of the battle-breathing maxims of the northern freebooters) is a fine, though short, melody. 'Frithiof cometh to King Ring' is not unlike Mozart's 'Return'—The gale of dawn was breathing.' We were much pleased with the 'Old Christmas Carol' to canto 11; it is really what it pretends to be, a genuine ancient melody. Among the engravings we notice the Scandinavian trumpet and harp, the former has a double bend, and is a modification of the Hebrew trumpet or shawm. The harp is of curious construction, it is in fact a triangular dulcimer set up on the modern harp sounding board, and must have been played upon by the performer standing.* Some of the notes are interesting from the insight

* The sounding boards of these harps being made very large also serve the extraordinary purpose of secreting *young ladies*! for we learn from a note to page 141, that during a nuptial festivity, that "Smith" (a magician) "skipped up the steps to the platform, where the harp lay, and, placing the bride in the instrument, lowered it from the window by a cord, and escaped with her."

they give into the habits of these 'bold Norsemen;' for instance, the 'Host fight on the Ice,' 'The gifted Birds,' or spirits, in their shape, one of the thousand resemblances to Asiatic manners, and many others that will interest the lovers of ancient lore.

The Runes of Scandinavia and the ancient Greek letters were inscribed on triangular pieces or staves of beech wood; now the word 'Buch' signifies both a book and a beech-tree. Thus we see why the beeches of Dodona spoke, and gave out oracles. See p. 229, Godfrey Higgins's 'Anacalypses.'

AMERICA.

NEW YORK.—Beethoven's *Fidelio* was well performed lately here by Mrs. Martyn, Miss Poole, Giubelei, Manvers, and C. Martyn. If the Americans can relish such music as this they are indeed rapidly improving in taste, the cultivation of which will be rendered gradually more easy to them, while some of our best singers find ready patronage on the other side the Atlantic.

Theatricals are at a low ebb in this country. Every principal theatre is losing money. The Park and National here, the Chestnut at Philadelphia, and the Tremont at Boston. The Bowery and Walnut-street are making money, but no others. Miss Shirreff and Mr. Wilson are making immense sums by their concerts in this city; the operatic corps at the Park are losing money. Charles Kean drew poor houses in Philadelphia and the south; his last engagement at the National was more successful. Vandenhoff and his lovely daughter have created a tremendous sensation in Baltimore and this city, and will wherever they may play. Celeste will not play here again; she is residing with her husband at Philadelphia; as soon as she recovers she will sail for Europe, and go to Baden-Baden. Klishnig, the great ape, is much admired by the New York ladies, who think him almost equal to the apes of Broadway. Chapman is well liked at the Park. Miss Poole and Mrs. Martyn, Sig. Giubelei and Mr. Manvers, are gaining ground nightly in the estimation of their audience; but still the houses are not well attended any where. The new theatre for Mr. Wallack in this city will be commenced shortly; and there is a talk of building a new opera-house at Philadelphia on a plan superior to every other theatre in this country. It is proposed that the basement shall be of marble, fifteen feet high, divided into stores of twenty feet front by fifty feet deep, and that the upper walls shall be ornamented with Grecian windows richly dressed; the whole crowned with a

chaste cornice. The stores will be fire-proof, and the row will be the most elegant in the city.

LONDON.

COVENT GARDEN continues at the head of our theatres, and the exertions of the fair lessee have met with their reward in the crowded attendances which have filled the theatre during what has heretofore been considered the most unprofitable period of the season. In addition to the delightful play of Love, the Beggars' Opera has been most effectually revived, and it is highly satisfactory to learn that Madame has a new opera by J. M. Jolly in a forward state of preparation, as well as a new play from the pen of the veteran author Leigh Hunt.

The HAYMARKET continues its brilliant career to the close of an almost unprecedented season. The Sea Captain, whose name is Macready, the most efficient commander in the service, has met with a prosperous voyage, the results of which must prove highly satisfactory to Mr. Webster, the indefatigable lessee, who has judiciously secured the invaluable services of Mr. Macready and Mr. Power for the next season. The first English tragic actress, Miss Helen Faucit, has been compelled from ill health to quit the stage; and it is greatly to be feared it will be long ere she can safely return to its boards.

DRURY LANE has been but indifferently attended for some time past, although free admissions for the season have been hawked about at a much lower rate than those of the best minor houses. It has, however, brought before the public two valuable additions to opera, and a tragic actress, Miss Montague. Mr. Lacy is getting up one of Boillean's operas for his daughter. Mr. Loder's opera will shortly be produced. Of the singers Miss Lacy (Delcy is the assumed name) has all the requisites by nature to make a fine singer. Her appearance is prepossessing, her enunciation clear and distinct, and her voice powerful, well toned and of large compass. As Agatha, in Weber's *Der Freischütz*, she was loudly and deservedly applauded. Mrs. Alban Croft, whose voice is good, but somewhat unequal, made an effective Polly in the Beggars' Opera. Two new tragedies are in preparation; the first "Mary Stuart," is from the pen of Mr. James Haynes, the author of "Durazzo;" the other, by Miss Mitford, will shortly follow.

It is daily argued the English have no taste for music, and the thin attendances at the theatres on the representation of operas are adduced as evidence. The Sacred Harmonic Society and the Concerts à la Musard,

springing up in all the great provincial towns, are sufficient to refute the general argument, yet it is evident there is a defect somewhere, and unless the several new operas now in a forward state from Rodwell, Macfarren, Rooke, Bishop, and others, are cast upon some soul-stirring events, such as will carry the interest of the audience throughout the whole of the scenes, they will probably share the unenviable fate of Rooke's *Henrique*. And although it might be considered an infringement of the laws of opera, yet were the heavy recitatives replaced by dialogue, it is certain that it would not tend so much to weary a novelty loving English audience.

We are glad to perceive the announcement of a weekly musical periodical, entitled the *Musical Journal*, professing to be impartial, and free from party spirit.

SACRED HARMONIC SOCIETY. Exeter Hall.—A greater proof of the entire success of this society cannot be adduced than in recording the fact that this immense hall is insufficient to accommodate the thousands who flock here on every representation. Handel's Oratorios of Solomon and the Messiah have been produced with extraordinary effect; some of the chorusses were at times truly grand. It is somewhat singular that most of the finest musical performances, and certainly the most successful in this country, are those at the cheapest rate of admission, and as a further proof we will instance the

CONCERTS A LA MUSARD AT THE ENGLISH OPERA HOUSE.—These very deservedly successful concerts are nightly filled with a select and fashionable company, who loudly attest their approbation of the selection as well as the execution of the overtures, waltzes and quadrilles. The solo performances are a principal feature in the entertainments, particularly those by Harper, Willy, Richardson and Baumann. The selection from Meyerbeer's *Robert le Diable*, arranged by the conductor Neri with obligato parts for corno inglese, bassoon and clarinet by Cook, Baumann and Lazarus, is a most effective and meritorious selection.

The Directors of the **PHILHARMONIC** have decided on altering the arrangements of the orchestra next season; the basses will be thrown back, and the violins will be brought more forward. This plan has been long adopted in France, and has been found to answer extremely well, for the instruments are better balanced—that is, the audience will hear more of the violins and wood instruments, and less of the ponderous basses and brass band. The new symphony by Spohr has been received, and will be shortly rehearsed, as well as Berlioz's new symphony to "*Romeo and Juliet*."

Among the musical publications lately

printed, there is a Treatise on "Singing in Parts; containing Progressive Instructions for the Simultaneous Practice of Two, Three, Four, Five, or a greater Number of Voices. By Thomas Cooke."—This is decidedly the best work we have yet seen on this branch of vocal art. The exercises commence from simple Intervals in Duetto, with some classical but short Duets from Mozart, Haydn, &c. Then follow Trios on the Intervals, succeeded by Webbe's "*O come o bella*," and three-part Rounds. Among the pieces in four parts are some excellent Rounds and Catches, by the author; '*Horsley Horncastle's*' Prize Catch, '*You've told a story*;' a few Canons, one by Sir G. Smart; some Madrigals, with a Hymn of Purcell's, and '*Et vitam*,' by Perti. The observations dispersed throughout the book are sensible and pertinent—if well studied, must materially assist those amateurs who are training as choral singers, of which there are not a few, if we may judge by the number of choral societies springing up everywhere.

'*Select Organ Pieces*.' Novello's Collection. Number 59.—The novelties in it are a chorus '*Et vitam venturi*,' by Horncastle; it is a Fugal piece of bold construction, well worked, and not too long; a chorus on the same subject by Lotti; and a pleasing *Andante* by C. Stokes. We have much pleasure in noticing two very beautiful Trios by a composer whose name has hitherto been unknown to us, a M. Curshman. The one commencing '*Addio*' is the most effective. The melody is charming, and well sustained throughout.

The "*Memoirs of Charles Matthews*," by Mrs. Matthews, is one of the most amusing biographies we remember to have read; but the writer has one besetting sin, which displays itself in almost every page—that of judging all characters by her own standard of perfection. Thus Mr. George Robins is the acme of perfection; nay, more, he is represented as the most celebrated man in Europe. This would be well did the writer but avoid the other extreme; for it is indeed with pain we observe the necessity which occasioned the publication of "*Forgotten Facts in the Memoirs of Mr. Charles Matthews*," by S. J. Arnold, Esq.

Mr. Arnold, who has deservedly earned a reputation unequalled as a theatrical manager (if we except Mr. Macready,) and whose exertions in the cause of English operatic music during a long career, will ever merit the thanks of this country, has been called on to refute one of the grossest misrepresentations that have ever been palmed on the public. Mr. Arnold says, and to this the world will bear witness:—

"Circumstances, it appears, prevented

my young friend Charles from fulfilling his intention (of writing the memoirs of his father;) and this I deeply regret, since the task has fallen into the hands of one who has, under some strange delusion, fallen into the great moral error of substituting fiction and misrepresentation for truth, and by strange distortion converted a most liberal and unprecedented engagement into an act of imposition, and even deep designing fraud. * * * And this is the return to a man whom your husband, during his life, acknowledged as one 'who was ordained to advance his fortune.'"

"The manner of dividing in Chanting the Words of the Psalms as used in some of the Churches." By Martin H. Hodges. 4to. This printed sheet is intended to apply a remedy to the really *irremediable* defects in chanting, arising from the impossibility of uniting all the voices exactly to-

gether when no regular time can be kept. Mr. J. B. Sale has written a work on the same subject, and both are useful as guides to persons unaccustomed to chant; but it must be evident to all who know any thing of the matter, that merely *one* inefficient singer introduced into a choir will mar the effect entirely, and no book can obviate the difficulty.

EDINBURGH.

Several Promenade Concerts have been given by Mr. Musgrave in the Hopetoun Rooms, and have been numerous and fashionably attended. Miss Platt's performance on the pianoforte was excellent of its kind. The solo on the cornet à piston, by Mrs. Wood, was exquisite, and received a warm *encore*. Mr. Musgrave led with his accustomed taste and spirit.

MISCELLANEOUS LITERARY NOTICES.

FRANCE.

Up to the end of October there had been published, during the present year, in France, 5324 works in the living and dead languages, 287 musical pieces, 1015 engravings and lithographs, and 100 maps and topographical plans.

The newly-discovered apparatus by which sea-water is rendered fresh and perfectly pure, has been placed on board several of the government vessels; two and a half gallons of coals are sufficient to convert thirty gallons of sea-water into a state of purity and fit for culinary and other uses.

Laborde's *Voyage de l'Orient* is proceeding rapidly; the last two numbers, the fifteenth and sixteenth, contain excellent views of Aleppo, Jerusalem, Jerico, Aden, &c. &c.; it will be completed in about thirty-six numbers.

Marc Aurel, frères, have just published the first volume of "*Biographie des premières Années de Napoléon Bonaparte*," by the M. de Coston; the second volume and Appendix will complete the work.

A very valuable illustrated geography has just been published by Chauchard and Muntz, of Paris, entitled "*Cours méthodique de géographie à l'usage des établissements d'instruction et des gens du monde*;" it has 22 maps and upwards of 400 finely-executed drawings. The 24th volume of the "*Archives curieuses de l'histoire de France depuis Louis XI. jusqu'à Louis XVIII*" has at length appeared.

A work highly interesting to the sporting world is now in the course of publication, "*Voyage d'un chasseur dans les différentes parties du monde, revue générale des chasses et des pêches de tous les pays*." The first portion of the work, *Africa*, has already appeared, and consists of forty-one numbers, containing forty engravings.

SAVOY.—The railroad from Chambéry to Bourget was opened the early part of Octo-

ber in the presence of the King of Sardinia; it is two French leagues in length, and runs by the side of a canal and within an avenue of poplar trees, affording a most picturesque view of mountainous country and the shores of the sea near Bourget. It will effect a great improvement in the trade between France and Chambéry, as it is connected with the steam-boats which run between Lyons and Burget.

GERMANY.

BERLIN.—A central society for statistics is in the course of formation at Berlin, with which all the statistical societies in Germany are to correspond.

The third centenary of the discovery of printing will be celebrated with great splendour at Leipzig, on the 24th, 25th and 26th of June, 1840. The next Number of this Review will give full particulars as to the several festivities which are to take place. It is generally considered the fêtes will exceed any thing before witnessed in that part of Germany.

A petition has been presented to the parliament of Saxony, now sitting at Dresden, for permission to construct a railroad from a point in the province of Lusatia (Lausitz) to Dresden, and from thence across the Mountains (Eizgebirge) and the district of Violgtlande to the frontiers of Bavaria.

One of the most interesting Journals published in Germany, is the "*Hannoversches Museum*," which appears twice every week at Hanover; it contains both literary and musical intelligence; the subjects are well selected and are written with great care and judgment. Since the death of the editor, Dr. Schröder, it has been continued with the same talent by the widow, who has engaged some of the first literary contributors upon it.

The German Meteorologists have declared the present will be a very severe winter.

The Aurora Borealis having been unusually vivid throughout Germany.

GREECE.

The first stone of the new university at Athens was laid on 14th July, with great rejoicing.

ITALY.

Trieste has been much improved within the last few years; and during the past summer innumerable old houses have been demolished and new streets built. In the neighbourhood of St. Andrea large portions of land near the sea have been built over, and even to where hills formerly stood on the land side, the city has extended its limits; in the Guardiella, sixty new houses are in process of building. The city now consists of 4240 houses, and 75,551 inhabitants; the increase of population within a short period being 2527.

A meeting of merchants was recently held at Trieste, at which the Archduke John presided; the object was the construction of a railroad from Trieste to Vienna. According to the plan of the engineer, Sommering, the only interruption to the line is a few miles of very mountainous country, which will be travelled over by horses. At the Castle of Duino, about three leagues from Trieste, the railroad will join the great Lombardy and Venetian branch. The Archduke expressed his approbation in the warmest terms, and added, that it was the earnest wish of the Emperor that this great desideratum should be effected, by which we may bid adieu to the shores of the Adriatic in the morning and sleep in the Austrian imperial capital the same night.

POLAND.

WILNA.—The publishers here as well as at Warsaw, are exceedingly cautious in accepting original Polish works; hence the few works which appear are either translations of popular French romances or school books, and the two Polish literary newspapers, 'Wizerunki' and 'Literatura i krytyka,' the latter by Grabowski, are mostly filled with translations from French and German newspapers, giving little attention to native literature.

Joseph Zawadzki, the principal bookseller at Wilna, died at the end of last year; his stock accumulated during thirty years amounted at the period of his death to upwards of 400 very rare and costly works; he commenced a catalogue of works on Polish Literature, the first volume of which has since been published by his sons, 'Obraz bibliograficzno historyczny Literatury Polskiej.'

Within the last two years, Joseph J. Kraszewski, a native of Omelo, in Volhynia, has created the greatest astonishment by his literary and poetical works. Since Moritz Mochnacki, no one has risen so high in pub-

lic estimation as Kraszewski; the first part of his 'Poezye' and his 'Wedrowski literackie fantastyczne i historyczne' (Literary, imaginative, and historical Wanderings), are highly spoken of by Grabowski and other learned authors, as being filled with youthful and vigorous pictures of every-day life. He is now employed in writing a history of Wilna, the first part of which has already appeared.

The first four parts of a history of Lithuania, 'Dzieje starozytne narodu litewskiego,' have appeared from the pen of Theodore Narbutt.

A very highly-wrought and interesting historical tale has been published by the author, Balinski, entitled 'Pamiętniki o królowej Babarze,' Memoirs of Queen Barbara Radzivil, consort of Sigismund August; the historical facts and data connected with this extraordinary woman, have been carefully collected from the Radzivilian archives.

The Memoirs of Maskiewiczza, recently published, 'Pamiętniki Samuela Maskiewicza,' who was born in 1594, are highly interesting, and contain many important facts connected with the history of Poland and of Russia. Ustriałow is at present engaged in translating the work into the Russian language.

Among the recent poetical publications, the 'Piesni wiesniaczne znad Memna,' Songs of the People of Niemen, by Czeczot, have met with especial favour; they are translations of the songs sung at the present day by the Lithuanian peasantry, in the white Russian dialect. The 'Poezye,' by Michael Juzierski, contain poetical descriptions of Ukrainian nature and life; and a third collection, 'Poezye trzech braci,' Poems by the three brothers Grzymalowski, are for the most part vivacious, mirthful, and amorous poems.

The 'Encyclopedia Powszechna,' a work which was noticed in the last Number of the 'Foreign Quarterly Review,' is so voluminous, that the twentieth volume, now just published, has only completed the letter B. The improbability of this work ever being completed has occasioned the publication of the 'Mala Encyklopedia,' of which two volumes have already appeared, containing all the letters as far as F. The articles are short and concise, and comprise everything interesting to Poland, particularly as to its people, its literature, its celebrated men, its cities, rivers, mountains, &c. The only omissions are its eminent living characters, and all those who figured in the last political events which led to such important changes in the government of this unhappy country.

Amidst the numerous works on Polish literature which have emanated from the house of Breitkoff and Härtel, in Leipzig, is a new edition of the celebrated work on Polish Heraldry, which was originally published at Lemberg, in four folio volumes, from the pen of the Jesuit 'Kaspar Niesiecki,' in 1728 to 1743, and who died in 1743. The Austrian cabinet acknowledged the work to be au-

thentic, in a decree dated 6th October, 1800. The new edition, entitled 'HERBARZ POLSKI Kaspra Niesieckiego,' has been very judiciously curtailed by Johann Bobrowicz, who has at the same time supplied some very important omissions from Wieladek's 'Heraldik,' Krasicki's 'Zusätzen,' and other works.

PORTUGAL.

In no country in Europe has literature so much deteriorated as in Portugal; even the daily papers are filled up with personal invectives and political disquisitions. In the boudoirs of their ladies nothing, save a few French romances, can be found. German writers ascribe this disgraceful state to the freedom of the press.

RUSSIA.

The Imperial Public Library contains upwards of 425,621 volumes, and 17,236 manuscripts, which are under the care of twenty-seven officials. The University Library has received a valuable acquisition in the library of Professor Schäfer, of Leipzig, including 633 Russian works, which had hitherto been wanting. The University, at the close of its academical year, consisted of 42 professors and 413 students.

Twenty-four works were sent in to the Academy of St. Petersburg, as competitors for the Demidow Prizes of 5000 rubles (£200) and 2500 rubles (£100); of these 5 were Historical, 4 Mathematical, 3 Medical, 3 Agricultural, 2 on Oriental Language, 2 on Military Knowledge, 2 on Jurisprudence, 1 Statistical, 1 Travels, and 1 Scholastical. All of which, with the exception of four, were written in the Russian language. The second prize was awarded to several, for only two were selected for the highest honour, viz. a Chinese Grammar, by the monk *Hycinth*, and a work on Military Tactics, by Major-General Medem.

An Armenian Professorship has been added to the University of Kasan, which has already made great progress in Oriental Literature, by its learned Mongolian and Chinese Professors. The salary attached to the Armenian chair is 4500 rubles, (£180 annually.)

A literary society at St. Petersburg have taken up the publication of the Russian Conversations-Lexicon, which had been delayed in consequence of the failure of Pluchart, the late publisher. Fifteen volumes of this work have already appeared, which will be very voluminous; it having only reached letter G.

The best annual is the 'Jutreniaja Zarja,' 'the Morning's Dawn;' it has several very excellent papers, and is embellished with four engravings.

A literary Russian newspaper has appeared in monthly parts at St. Petersburg. It contains many valuable sketches on Russian literature and history, and is edited by Krjewski, while in the list of its contributors

are ranked some of the best Russian writers. A few translations are occasionally inserted, some scenes from Göthe's Faust, and one of Tieck's novels were the most recent.

A very comprehensive catalogue of Russian works, and in particular those referring to the history of the Russian empire, has been published recently by Tschertkow of Moscow.

A continuation of Strahl's Russian Religious Historians is in the course of publication, by Professor Snegirew, of Moscow. The first part contains a biography of the author by himself, who intends including the lives of ALL great Russian historians, by which it will comprise a biography of more than 250 individuals.

SCLAVONIA.

The several Slavonic nations forming the southern boundary of the Austrian empire, and comprehending the countries or districts of Dalmatia, Illyria, Croatia, Servia, Kainen, Kartnen and Steyermark, with a population of five millions, have always been distinguished by a language peculiar to themselves; this language is comprised of seventeen distinct dialects, and from which Dr. Ludewit Gai, of Agram, has grounded one common language, and has brought it into general use since 1836, in the Illyrian national newspaper, which he publishes twice each week; entitled 'Ilirske Narodne Nowine.' This paper, and its extra weekly sheet, entitled 'Danica Ilirska (Illyrian Morning Star), is written in the Illyrian dialect, as spoken by the inhabitants of Croatia, Dalmatia, the Hungarian coast, Servia, Bosnia, &c., but it is readily comprehended by all the other Slavonic tribes.

A printing establishment has been formed since 1838, at Agram, with new types, under the direction of Dr. Gai, and has already issued several interesting works. Among others the "Dramatic Attempts," 'Dramaticka Pokusenjo,' by Dr. Demeter, the first part of which contains two dramas, founded on old Ragusian tragedies; they are entitled 'Ljuba i Duznost' (Love and Duty), and 'Karvna Osveta (Revenge for Bloodshed). Another drama has also appeared at Agram, entitled 'Juran i Sofia' (Juran and Sophia), or the Turks at Essek, by J. Kukuljewitsch Sakschinski, giving a faithful display of the old Ragusian classics, to which is prefixed an episode of the fight with the Turks; and 'Delightful Tales,' 'Ugodne Pripoviesti,' by A. Russi, in one volume, printed by the Dr. Gai above mentioned, are translated from the Italian.

Viekoslaw Babukitsch has laid the first foundation of a comprehensive grammar, by the publication of 'Osnova Narijecja Ilirsko-ga,' an Illyrian grammar, printed and published at Agram. A dictionary of the Illyrian language will also shortly appear, and a society for the diffusion of the new language has been formed at Agram, of which Count Draskowitsch is the president. He has written a work entitled A Word to Il-

lyria's Daughters, to which a most important article is appended by Schaffarik, upon the early Illyrian history and regeneration of the modern literature of the country. The first Illyrian kingdom, according to Draskowitsch's account, was formed by Cadmus, 1443 years B. C., near to where Dubrownik (Ragusa) now stands. Feared by the Greeks and Romans, they were warred upon by the tyrant Dionysius, the Macedonian kings, and Alexander the Great; the latter had many of the brave Illyrians with him in the Persian war, and at his death they became so powerful under their kings Pevrat and Ogram, that Rome tried every method to weaken them. Upon the fall of Carthage, the throne of the Illyrian king Gencius and the country fell into the hands of the Romans, who called it Iliria (Illyricum). Two thousand three hundred and twenty-six years after the foundation of the first Illyrian kingdom, then A. D. 883, the Magyars took possession of Illyria, with the exception of Croatia and Dalmatia, who protected their king Beda IV. and his family, but the Tatars were ultimately driven back and the Hungarian dynasty restored.

From the end of the fourteenth century learning gradually sprung up in Dalmatia, and several Poets, and among others Zlataritsch, Palmotitsch, and Katantzitsch, became known to the world by their learned writings and their poetry; to these followed the most celebrated Illyrian poet of former times, Iwan Gundulitsch, who was born in 1588. He wrote twelve dramas compiled from old Greek tragedies, and the celebrated epic poem 'Osman Spiewan,' in twenty songs. Some few of his works have been reprinted lately, but the greater part was lost in the earthquake of Ragusa, in 1667, and which probably destroyed many other highly important documents.

SICILY.

The earliest records of the literature of Sicily are contained in the 'Biblioteca Siciliana,' by Antonio Mongitore, and the 'Elogi d'illustri Siciliani scritta dal Ragusa.' In the reign of Alfonso, Salvatore de Blasi commenced the history, with the origin and progress of Sicilian literature, collecting his materials from the writings of Domenico Schiavo, and Rosario Gregoria; but this necessary work has never been completed, and what had been written by Francesco Vesco, the Greek professor of the university of Palermo, and a great writer on literature, was never printed, and is consequently lost.

From an early period, the Greek, Latin and Hebrew languages were taught at all the Sicilian schools. In the 12th century, the Italian was first used by the native poets in simple and agreeable strains; from the 13th to the 15th centuries it gradually fell into disuse, and all the learned authors wrote in Latin. During the 17th and greater part of the 18th centuries, French became the prevailing language of all their authors.

The first to break this rule were Antonio Cesari and D. Salvagnini, who produced Segni's 'Storie Fiorentine,' and several other excellent works in Italian. Gianagostino de Cosmi laid the foundation of the general Italian grammar, and published three volumes 'Degli Elementi di Filologia,' and afterwards Cesari's 'Dissertazione sulla lingua Italiana.' These were succeeded by Gregorio's 'Discorsi intorno alla Sicilia,' and Tommaso Gargollo's 'Viaggio in Grecia,' published in London, and his 'Memoire sulle belle Arti. Count Sebastiano Ayala de Gastrogiovanni published his Dizionario della Crusa at Vienna.

Of all the early Sicilian poets, Giovanni Meli must be noted as the most celebrated. His songs soon became national airs, and the people acknowledged him as their national poet. Among his numerous writings, his Anacreontic odes were considered as superior to those of other poets. Ignazio Scimonelli, C. F. Gambino, and O. Tercio, all rose to great favour through their national poems. A. Galfo published his 'Saggio Poetico' in four volumes, during his residence at Rome; his drama of 'Il Socrate' met with especial favour. C. Gaetani, Count de la Torre, gained considerable fame by his poems, 'Sui Doveri dell' Uomo,' and 'Ecloghe Piscatorie,' in addition to his translations of the Greek authors. To these must be added T. Gargallo, whose fame still spreads throughout all Sicily and Italy, while his odes and his 'Anno Poetica' published at Venice amply prove his perfect acquaintance with the ancient classic historians and other celebrated writers.

SWITZERLAND.

The first part of a work, forming a valuable addition to the history of Switzerland, has just appeared at Lausanne, 'Mémoires et Documents publiés par la Société d'histoire de la Suisse romane.' It contains the rules of the society, a list of the members, a Mémoire sur le rectorat de Bourgoynne, the Statuts inédits de Pierre de Savoie, and an historical notice of the Counts of Gruyères.

NEUCHÂTEL.—Dr. Agassiz, the celebrated Geologist and author of 'Récherches sur les Poissons Fossiles,' which has already reached the 13th part, has just published the first number of an 'Histoire naturelle des Poissons d'Eau Douce,' to be complete in two volumes of letter-press and 90 plates. The first part of his 'Monographies d'Echinodermes' has also appeared.

MISCELLANEOUS.

Frank Hall Standish's work, entitled Seville and its environs, nearly ready and will be embellished with a portrait of the author.

A translation of the *Second Part* of Göthe's Faust is in the course of Publication from the pen of Jonathan Birch, Esq., the talented translator of the First Part of Göthe's Faust,

and several other works. The superior manner in which the first number has been got up leaves no doubt of the ultimate success of the work.

One of the most perfect instances of 'the pursuit of knowledge under difficulties,' is displayed in a clever little work entitled 'The Autobiography of Thomas Platter,' who figured in the sixteenth century. The narrative is simple and unpretending, and savours of a pure religious spirit, consonant to the times in which it was written.

Gatherings from Grave-yards, with a history of the Modes of Interment among different Nations, by G. A. Walker, affords another proof of the vicious folly of interring the dead within the walls of a densely popu-

lated city. Our continental friends will be really surprised, on the perusal of this work, to find the citizens of London, in this particular, so far behind the rest of the world.

'Notes on South African Affairs,' by W. B. Boyce, recently published, contains some valuable remarks as to Kafferland, and excellent hints on the best and most approved systems of border policy.

'Chartism,' by Thomas Carlyle, is a work containing ten short and concise chapters on the condition of the labouring classes in this country and Ireland. The fourth and concluding chapters in particular embody some very apt and shrewd remarks.

LIST OF THE PRINCIPAL NEW WORKS

PUBLISHED ON THE CONTINENT,

FROM OCT. TO DECEMBER, 1839, INCLUSIVE.

THEOLOGY AND ECCLESIASTICAL LITERATURE.

- Berlage, Christkatholische Dogmatik. Vol. I. 8vo. Munster. 6s.
- Bayle-Moullard, Du Progres social et de la conviction religieuse. 8vo. Paris. 9s.
- Bruch, Etudes philosophiques sur le Christianisme. Vol. I. Part I. 8vo. Strasb. 5s.
- Bible, La, traduction nouvelle, avec l'hébreu en regard. Vol. X. XVIII. Paris. 8vo. 7s. Vellum paper, 10s. 6d.
- Boulland, Histoire des transformations religieuses et morales des peuples. 8vo. Paris. 7s. 6d.
- Cacheux, Essai sur la philosophie du Christianisme, considérée avec la philosophie moderne. Vol. I. 8vo. Paris. 7s.
- Corpus scriptorum historiae Byzantinae, containing Codini Curopalatae de Officialibus Palatii Cpolitani, et de Officiis magnae ecclesiae liber, recog. Im. Bekker. 8vo. Bonn. 10s. Vellum paper, 16s.
- De l'état actuel du clergé en France, et en particulier, des curés ruraux appelés desservans. 8vo. Paris. 6s.
- Die Heilige Schrift des Alten und Neuen Testaments, von W. M. de Wette. 3 parts. 8vo. Heidelb. 18s.
- Fuchs, Annalen der Protestantischen Kirche im Königreich Bayern. Part I. 8vo. Munich. 4s. 6d.
- Gladde, Du progrès Religieux. 2d ed. 3 vols. 8vo. Paris.
- Goulianos, J. A., Archeologie Egyptienne, ou Recherches sur l'expression des signes hieroglyphiques, et sur les élémens de la langue sacrée des Egyptiens. 3 vols. 8vo. Leipz. 2l. 17s. 6d.
- Guerike, H. E. F., Evangelische Zeugnisse in Predigten auf das ganze Kirchenjahr gehalten vor Lutheranern. 8vo. Leipz. 7s.
- Hävernicks, Dr. H. A., Handbuch der historischkritischen Einleitung in das Alte Testament. Part II. Sect. I. 8vo. Erlangen. 6s. 6d.
- Leclère d'Aubigny, Histoire véritable des doctrines et des actes de la compagnie de Jésus. Vol. I. 8vo. Paris. 6s.
- Maurer, Commentarius grammaticus historicus criticus in Vetus Testamentum. Vol. II. Part III. 8vo. Lips. 6s.
- Pouvoir du Pape sur les souverains au moyen-âge, ou Recherches historiques sur le droit public de cette époque relativement à la déposition des princes. Par M. —. 8vo. Paris.
- Sternberg, Saint Sylvan. 2 parts. 8vo. Frankf. 13s. 6d.
- Strauss, Dr. D. F., Charakteristiken und Kritiken. Eine Sammlung zerstreuter Aufsätze aus den Gebieten der Theologie, Anthropologie und Aesthetik. 8vo. Leipz. 13s. 6d.
- Vie de Jésus, &c., traduit par E. Littré. Vol. I. Part II. 8vo. Paris. 7s.
- Testament, Das Neue, nach der deutschen Uebersetzung von M. Luther. Mit Erklärungen &c., einem Aufsätze über Palästine und seine Bewohner. 3d edition. 4to. Berlin. 13s. 6d. Fine paper, 18s. 6d.
- Theremin, F., Christus und Pilatus. Eine fasten Predigt. 8vo. Berlin. 1s.

LAW, JURISPRUDENCE, AND STATISTICS.

- Blanc, Traité de la Contrefaçon et de sa poursuite en Justice, 8vo. Paris.
- Corpus juris romani antejustiniani, E. Böckingius. Part III. 8vo. Bonn. 14s.
- Coulon, Dialogues et Questions de Droit. 3 vols. 8vo. Dijon.

- D'Audiffret, Examen des revenus publics. 8vo. Paris.
- Encyclopédie des lois, dictionnaire général annoté des lois, décrets, ordonnances et règlements, depuis 1788. 17s. 6d. Vol. VII. 4to. Paris. The work complete, 7l. 5s.

INDEX TO VOLUME XXIV.

A.

- Abdallah, Pacha of Acre, his revolt against the Grand Signior, 224; proceedings of Mehemet Ali, and Ibrahim, with reference to him, *ib.*
- Aden, importance of to England, 228.
- Advice, and Anticipation, 159.
- Æschylus, his excellence as a dramatic writer, 129; simplicity of his plots, 136; character of the Æschylean chorus, 142.
- Affghanistan, recent expedition against, 215-231; ill-will of the Affghans towards the British, 231; impolicy of our support of Soojah, *ib.*
- Akber, anecdote of, 186.
- Akhtak i-Jalady, from the Persian of Jany Mohammed Asaad. Practical philosophy of the Mohammedans. Translated by W. F. Thompson, Esq., 174.
- Alcott, Mr., "Doctrine and Discipline of Human Culture," 158; his views of the nature and means of national improvement, *ib.*; extracts, 158, 159; definition of imagination, 159; holds the highest manifestations of genius to be the result of great moral development, 160.
- Americans, their tendency to adopt the prejudices of older nations, 156.
- Antiquity, slender acquaintance with it possessed by the learned, 176.
- Apostolic Constitutions, probable date of the compilation, 197.
- Arabeski, Rasnæi Sotchiheniya, (Arabesques, or Miscellaneous Pieces, by Ivan Gogol,) 161; character of the work, 173.
- Arabian Nights, introduced into Europe by Galland, 77; their first reception, *ib.*; their interest increased with our Oriental intercourse, *ib.*; theories of the learned respecting their origin, 77, 78; striking identity of some of the stories with popular European tales, 78, 79; Mr. Lane's translation, its merits, 81; his remarks on the period when the work was composed, *ib.*; inferences from the story of Habib, 83; testimony of Masoudi, 84; singular beauty of the illustrations of Mr. Lane's edition, 85.
- Architectonisches Album, redigirt von Architekten Verein zu Berlin, (Architectural Album edited by the Architectural Society, Berlin,) 161.
- Architectura Domestica, von A. de Chateauneuf, 161; architectural taste and skill at a low ebb in the present day, 161-165; few English architectural publications, 162, 163; little influence exercised by the Royal Institute of British Architects, 163; falling off in the architectural part of the Royal Academy's exhibitions of late, *ib.*; whether architecture be justly entitled to the appellation of a fine art? 165; encouragement and progress of architecture in foreign countries, 165, 166; Hope's History of Architecture, 166; character of our more recent edifices, *ib.*; notice of the Königsbau at Munich, 167; Klenze's architectural merits, 167, 168; the present German school of architecture, 169; note—excellence of Grecian architecture, 170; hints for academies of art, 170, 171; note—Wiegmann's views respecting the unfitness of Grecian architecture for modern purposes, 171, 172.
- Aristophanes, his high character as a dramatist, 130.
- Aristotle, his opinion respecting the dramas of Euripides, 130; amount of his commendation, *ib.*; his poetics, 147; his ten categories, 183.
- Asiatic Society—importance of its labours, 178; deserving of national support, *ib.*
- Art manifests itself in the superfluous, 16
- Athenian tragedians all sacred poets, 131.
- Austria, present views of, with reference to Turkey, 217.

B.

- Bagpipe, its Arabic origin, 112.
- Beauty, its all-pervading presence, 157; importance of cultivating a taste for the beautiful in nature and art, *ib.*
- Beethoven's monument, 239.

Belgium, its satisfactory progress since the revolution, 41; industrial operations, 42; the coal-mines of Hainault, *ib.*; Mr. Cockerill's vast establishment at Seraing, and the cloth manufacture at Verviers, *ib.*; educational institutions, 43; the unpopularity of the Dutch system, *ib.*; measures for the promotion of education since the revolution, 44, 45; comparative state of education in Belgium, 45; over-working of children in the factories, 46; Belgic Universities and Athanées, *ib.*; University of Louvain, *ib.*; connection of education with the Catholic faith, 47; influence of the Catholic clergy, *ib.*; progress of crime, and discipline of prisons, 48; infrequency of capital punishments, *ib.*; defects of prison discipline, 48, 49; separate system of prison discipline recommended, 49; treatment of discharged criminals, *ib.*

Bjornstjerna (Count), observations on the difficulties attending a Russian invasion of Hindostan, 231.

Bibliographical Essay on the collection of voyages and travels edited and published by Levinus Hulsius and his successors at Nuremberg and Frankfort, from 1598 to 1660; by A. Asher, 31.

Bidpai. See Pilpay.

C.

Cards (playing), origin of, 190; illustrations from the images of the Kandian kings and queens, *ib.*; their great antiquity, 191; Indian cards, *ib.*; [note.]

Castes, the four, in India, the origin of unknown, 82.

Channing on Self-Culture, 156; his name identified with American literature, *ib.*; extracts from his address, 157; an advocate for awakened perceptions and cultivated faculties, *ib.*

Chateaneuf's *Architectura Domestica*, 161; his design for the new Royal Exchange in London, 173.

China, present state of our relations with that country, 59; stationary condition of the people, *ib.*; advantages likely to result from an amicable alliance with them, *ib.*; no armed interference with them of late years, reason of this, *ib.*; their national vanity, 60; and aversion to strangers, *ib.*; and deceitfulness, *ib.*; line of conduct to be pursued in our intercourse with them, *ib.*; cause and effect of the attempts of various nations to monopolize the China trade, 60, 61; successful attempts of the Jesuits to diffuse Christianity among them, *ib.*; effect of the honourable conduct of the East India Company, 61, 62; opium trade, 62; its introduction and rapid increase, 62, 63; smuggling of opium, 63; direct and collateral evils of this, 64, 65; rapid increase of population recently checked, 66; mischievous and demoralizing effects of the passion for opium-smoking, 67, 68.

Chess, encyclopædia of, 233.

Chorus, in the Greek drama, important place occupied by it, 140-142.

Churches, modern ones, poverty of their architecture, 174.

Classical Scholars, queries for them, 177.

Coach, a word of Hungarian origin, 27.

Country, recollections of, in cities, 159.

Commercial advantages, incompatible with the exercise of cruelty and injustice towards foreign states, 59.

Corporal punishment, pernicious tendency of an excessive employment of it in schools, 58.

textum recognitum iterum exprimi curavit J. M. Redslob, ib. See Korann.

Cretan Dance, 112.

Cyprus, importance of, to Turkey, 228.

D.

Das buch Henoch, in vollständiger Uebersetzung, mit fortlaufenden Commentar, &c. (The Book of Enoch, translated entire, with a running Commentary, &c.) Von Andr. Gottl. Hoffmann, 195.

Dæmon, sense in which the word is used by Homer, 207.

Das Verdienst der Deutschen um die Philosophie der Geschichte.—Vortrag zum Krönungsfeste Preussens am 18 Januar, 1835, in der Deutschen Gesellschaft zu Königsberg gehalten, und mit erläuternden Beilagen, herausgegeben von Karl Rozenkranz. (The Merit of Germans in developing the Philosophy of History. An Address to the Königsberg German Society at the Anniversary of the Coronation of the King of Prussia, 18 January, 1835; with Notes, by Charles Rozenkranz), 31.

Das Hirn des Negers mit dem des Europaers und Orang-Outangs verglichen. Von Dr. Friedrich Tiedemann. (The Skull of the Negro compared with those of the European and Oran-Outang), 31; capacity of the negroes for improvement, 39.

De Kock's Novels, 91; his peculiar characteristics, 96; extracts from his writings, 96-100—101-107; great popularity of his works, 100, 101.

Deschappelles, Treatise on Whist, 186; design and plan of the book, 187, 188; extracts from it, 192-195.

Dost Mahommed, impolicy of our conduct towards him, 176-215.

De l'Etat de l'Instruction Primaire et Populaire en Belgique, par Ed. Ducpétiaux, 41; Des Progrès et de l'Etat actuel de la Reforme Penitentiaire, *ib.*

Dickens (Charles), observations on his writings, 94; defects of "Oliver Twist," *ib.*

Duelling, measures for the suppression of, 108.

E.

East, trade of, its overland channels, 228.

Education in Belgium, 43; great progress of the Dutch system, 44; account of it, *ib.*; true basis of a good education, 196.

Elliott (Mr.) remarks on the present political condition of Turkey, 217; with reference to Austria, *ib.*; and Russia, *ib.*; remarks on the rise of Mahomet Ali's power, and on his mode of retaining it, 226, 227; observations on Egypt and Syria, 227, 228.

Enoch, the Book of, 195; its probable Ethiopic origin, 201; Dr. Lawrence's conjecture that the author was a Jew, *ib.*; period of its composition discussed, 202; probably preserved by the Ethiopians alone, 203; the doctrine of the Trinity, *ib.*; extracts, 204-210; the work a palpable fabrication, 211; partakes largely of Persian mysticism and tradition, 213.

Ephesus, present condition of, 153.

Erulians, brief account of them in Procopius, 33; defeated by the Lombards, *ib.*

Essai sur la Statistique Générale de la Belgique, par Xavier Heuschling, 41.

Essai sur les Fables Indiennes et sur leur Introduction en Europe, par A. Loiseleur Deslongchamps, 76; Contents and character of the work, 91.

Ethiopians, who were they? 203-213; the Ethiopic church, from Alexandria, 213; origin and import of the name, 214—part of the world inhabited by them, *ib.*

Ethiopic Church, its superstitious reverence for traditional antiquity, 201.

Etruscan music, 236.

Euripides, his defects, 129; opinion of Aristotle respecting his writings—amount of his commendation, 130; opinion of Quintilian, *ib.*: mistook his calling in applying himself to the drama, 131; opinion of Thomas Magister discussed, *ib.*; the Euripidean prologue, 131, 132; the Hecuba, 132-134; his sneer at Æschylus, 132; his skill in painting, 133; his dramatic incapacity, 133, 134; Herr Gruppe on the character of his writings, 134; design of the Orestes, 134, 135; its defects, 135; complexity of his plots, 136; the Medea, 137; remarks on the Ion, 137-139; his popularity with the Athenians accounted for, 139, 140; Milton's partiality for him, 140; splendour of the chorus of Euripides, 141.

F.

Falsehood, its prevalence and popularity, 92, 93.

Fandango and Bolero, now little known in Spain, 110.

Federmann (Nicholas), his travels of discovery, 34; his cruel treatment of the Indians, 35; his efforts to convert the natives to Christianity, *ib.*

Ferdousi, celebrity of, introduced much of the chivalry of the East into Europe at the Crusades, 79.

Fine Arts, their progress checked in the present day by the spirit of trade, 161.

France, Egypt, Russia, Turkey, Asia, 214-233.

Fresco Painting, unfit for internal decorations, 168.

G.

Gengiskhan, his conquests, 17.

Genius, the result of moral development, 160; no less essential to the reader than to the author, *ib.*

German Criticism, importance of the study of, 147, 148.

German influence upon the civilisation and progress of uncultivated nations, 31; German influence in ancient times and in the middle ages, 31, 32; circumstances which have long tended to further the progress of civilisation among them, 32; their influence upon the abolition of the slave-trade, *ib.*; their missionaries, philosophical writers, linguists, and travellers, *ib.*; advantages of the absence of a national colonial interest, 32, 33; condition of Germany at the period of the discovery of America, 33, 34; Ephemerides of John Müller (Regiomontanus), 34; circumstances which led to the occupation of Venezuela, *ib.*; geographical studies of the Germans, 36; opposition to the slave-trade, *ib.*; the age of Luther, its influence still beneficially felt by the world at large, *ib.*; influence of German colonists, especially in Russia, 37, 38; Humboldt and Forster, 38; light thrown by German scholars upon Oriental literature, 39; new schools of philosophical historians, 40; schools of Herder, Kant, and Schelling, *ib.*; Fichte's lectures, *ib.*; labours of Steffens, Hegel, and Herbart, 41.

Geschichte, Magyaren (History of the Magyars), von Johann, Grafen Mailáth, 15; political importance of Hungary in former times, *ib.*; once the bulwark of civilized Europe against the in-

roads of the Ottoman hosts, *ib.*; heroic deeds of the Magyars, *ib.*; popularity of Count Mailáth's works, *ib.*; brief survey of the history of Hungary, *ib.*; irruption of the Magyars into that country, *ib.*; their conquests, 15, 16; checked by Otho the Great, 16; their conversion to Christianity, *ib.*; conduct of the first Crusaders, *ib.*; desolating progress of the Mongols, 17; are checked, and return to Asia, *ib.*; the charter of the Golden-Bull, wrested from Adrian II., nature of some of its provisions, *ib.*; character of St. Stephen, and of Bela I., *ib.*; the disastrous battle of Mohács, 18; protracted struggle between the Austrians and the Turks for the possession of Hungary, *ib.*; account of Pazman, 18, 19; specimen of Magyar history, 19, 20; the Hunyadis, 20-23; Mathias Corvinus proclaimed king, 23; imprisons his uncle, 24; description of his first campaign against the Turks, *ib.*; invades Bohemia, *ib.*; suppresses the discontent of the Hungarians, 25; defeats the Turks and takes the fortress of Shabacz, *ib.*; the magnificence of his court and camp, 26, 27; his great popularity, 27; his personal appearance, *ib.*; anecdotes respecting him, 28, 29; his death, 29; character of the work, 30, 31.

Geutebrüch, merits of the Buchhändler Börse at Leipsic, erected by him, 172.

Gotama, the founder of Logic in India, 183.

Greek Drama, its musical and religious importance, 139-148; congruity essential in the materials, 134; essential principle of the Greek tragedy, 140; its component parts, *ib.*; the drama a part of the chorus, *ib.*; action not a principal thing, 141; the modern opera contrasted with it, 142; fatality and chance, 143-145; the tragic trilogy, 146; influence of the chorus, *ib.*

Greeks, ancient, their emulative spirit, 56; importance of the study of Greek literature, 146, 147; best method of pursuing the study, 147, 148.

Greenland, supposed by some to be the Thule of the ancients, 33; Crantz's account of the Moravian mission, 37.

Gruppe (Herr), on the merits of Euripides, 134; remarks on the Ion, 137-139; character of his criticisms, 148, 149; his views respecting the Greek drama, 149, 150.

Gutzlaff's Missionary labours in China, 37.

H.

Hainault, the coal-mines of, 42.

Handel, reminiscences of, 113; anecdote of, 114. "Harmonious Blacksmith," origin of, the air, *ib.*

Haughton, (Sir Graves), inquiry into the first principles of reasoning, 182; note—Mohammedan metaphysics, 182, 183.

Herrmann (Waldemar), of Dresden, his merits as an architect, 172.

Hindostan, policy of Great Britain with respect to animadversions upon, 215, 216.

Histoire sommaire de l'Égypte sous le Gouvernement de Mohammed-Ali, par M. Félix Mengin, 214.

Hope's History of Architecture, 166.

Hunyadis, circumstances under which they first appear in history, 20; John Hunyadi forces the Sultan to raise the siege of Belgrade, 22, 23; his death, 23.

Hussar, origin and import of the term, 24.

I.

Jains, vast library erected by them at Anhulwara, 80; expediency of exploring it, 178; their Causes and Categories, 183.

Idealism of Kant, common and transcendental, 50.
 Ikisat, origin and import of the word, 214.
 Imagination, defined, 159.
 India, impolitic proceedings of our government with reference to, 215, 216.
 Intercourse between the more and less civilized races, 32.
 Iron Ore, better smelted with wood than with coal fires, 227.
 Isaiah's martyrdom, old tradition among the Jews respecting the circumstances attending it, 196, 197.

K.

Kant's (Im.) sorgfältig revidirte Werke (Kant's Works carefully revised), 49; Kant's Im., *Sämmtliche Werke* (Kant's complete Works), ib.; posture of mind in which his philosophy may be most advantageously studied, ib.; his system contrasted with those of Fichte, Wolfe, Schelling, and Hegel, 50; outlines of his system, 50, 51; forms of judgment, 51; the will, 52; Kant's birth, parentage, and education, ib.; reforms effected by him in the method of knowledge, 54, 55; points of resemblance between Kant and Socrates, 55, 56; his opponents, 56; his system unjustly depreciated in these days, 57; slender progress made by certain of his followers, ib.; his eclectic spirit with reference to former systems, 58.
 Korann, its style and contents, 1; Sale's translation, ib.; construction of the Arabic text, 2; progress and composition of the volume, ib.; numerous and intolerable repetitions, 2, 3; absurd arrangement of the chapters, 3; real commencement of the book, ib.; description of the last day, 5; singular incoherence of the parts, 7.
 Klenze's architectural merits, 167, 168.

L.

Learning, a little now deemed a useful thing, 175; true learning of slow growth, 196.
 Leibnitz, intellectual system of, 53.
 Locke, his classes of original ideas, 184.
 Louvain, University of, 46.

M.

Magyars, Mailáth's History of the, 15; irruption of, into Hungary, ib.; their conquest, 15, 16; conversion to Christianity, 16; their condition under Maria Theresa, 18; specimens of Magyar history, 19, 20; their fate after the death of Mathias Corvinus, 29, 30.
 Mahomet, views and objects of, in the composition of the Korann, 1; style and contents of it, 1, 2; mental perturbations and morbid enthusiasm of the impostor, 3; his earliest converts, and more public proceedings, 4; his description of the last day, 5; not justly chargeable with malignity, 6; his argument from the inimitability of the Korann, ib.; vicinity of the Arabs to the Jews, ib.; imitations of the Jewish and Christian Scriptures, 6, 7; excuses his inability to work miracles, 7; his unqualified assertion of the doctrine of predestination, ib.; his precepts and regulations, 8; held the abstract possibility of the resurrection, ib.; ceremonials prescribed for the occasion of the annual pilgrimage to Caaba, ib.; injunctions relative to the intercourse of his followers with unbelievers, 9; occasion of the adoption of his final policy, ib.; the number of his followers increased, ib.; compelled by the

violent proceedings of the Coreyish to flee from Mecca to Medina, ib.; recognises war as a principle of religion, 10; character of his earlier followers, ib.; defeated at Ohad, 11; regarded by the idolaters of Mecca as a Jewish or Christian sectarian, ib.; his admiration of the morality of the New Testament, ib.; opposed by the Jews of Medina, ib.; the earlier moderation of his tone altered by success, 12; marries Zinaba, the wife of his freeman Zeid, ib.; the conquest of Mecca, 13, 14; Mohammedanism neither to be assailed nor defended by the arguments usually resorted to, 14; his general character, ib.

Man, in connection with facts, 160.

Marmont, (Marshal,) remarks on the state, prospects and designs of Turkey, 219, 220; observations on the rise of Mehemet Ali's power, and on his mode of retaining it, 225, 226.

Mehemet Ali, visit to his court, 153; his personal appearance, 154; history of Egypt under his government, 214; his personal talent, 223; his tyrannical proceedings, 223, 224; origin of his quarrel with the Grand Signior, 224; reflections on the rise of his power, 225, 226.

Metsehaf Enoch Nabi, (The Book of Enoch the Prophet, an Apocryphal production, supposed for ages to have been lost, but discovered at the close of the last century in Abyssinia. Now first translated from an Ethiopian MS. in the Bodleian Library,) by Richard Lawrence, D.D. Archbishop of Cashel, 195.

Middle Ages, their architectural productions contrasted with those of the present time, 161.

Mohammedan anecdote, 181, 182; practical philosophy of the Mohammedans, 174; Mohammedan metaphysics, 182, 183.

Moravian Missions, 32, 33.

Muller, John, (Regiomontanus,) his Ephemerides, 34.

Music, abroad and at home, 110, 234; forbidden by the sultan, 235.

N.

Nabathean worship, 207; origin of the name, 212.
 Natural illustration, low use of it, 159.

Negroes, physiological investigations respecting them, 31-39; their capacity for improvement, 39; examination of the brain of the negro, ib.

Novels, general demand for them, 92; general character of novelists, 93-94; subjects not to be sought for only in external manifestations of life and character, 95, 96.

O.

Opera, the modern, contrasted with the Greek tragedy, 142.

Oriental opinions, manners and feelings, importance of an acquaintance with them, 174-176; necessity and means of promoting an acquaintance with Oriental literature, 178.

Oriental Translation fund, labours of, 174; design of, 178; deserving of national support, ib.

Opium Trade with China, 58; Thelwall on the iniquities of the opium trade, note—ib.; its introduction and rapid increase, 62, 63; smuggling, 63; mode, and chief places, of its cultivation, ib.; monopoly of the drug, ib.; effect of opium upon the health, 64-66; testimonies of the Chinese themselves, extracts from native documents, 66; measures taken by the Chinese authorities for the repression of the traffic, 67; evil effects of these upon general commerce, ib.; Chinese accounts

of the injurious effects of opium, especially upon the troops, 67, 68; the emperor advised to cut off the foreign trade altogether with a view to suppress the opium trade, 68, 69; vain excuses attempted for the traffic, 69; animadversions on the conduct of Captain Elliott, 70; arrival and proceedings of Commissioner Lin at Canton, 71; measures of Captain Elliott, 71, 72; observations on the conduct of the Chinese authorities, 72; plan most advisable in the present posture of affairs, *ib.*; absence of a naval protecting force for English traders, on the Chinese coast, *ib.*; cultivation of the poppy, 72, 73; mode of smuggling at the different sea-port towns, 73, 74; and at Canton, 74; iniquity of the trade, 232; shameful negligence of the British government, *ib.*

Oxus, navigation of the, 230.

P.

Palestrina's celebrated mass, 237.

Parthians, unknown in history till 250 B.C. 201.

Pazman's missionary labours, 18, 19.

Philosophy of Asia, state of, compared with that of Europe, 180, 181.

Pilpay, fables of, their origin 91; Persian account of them, *ib.*

Plato's five forms, 183.

Poetry, the first form in which the intellectual development of a people displays itself, 161.

Poppy, cultivation of, in the East Indies, 72, 73.

Posting in carriages, origin of, 27.

Prison Discipline, the separate system of, recommended, 49.

Provence, literature of, 108.

Prussia, justifiable distrust of, on the part of Great Britain, 229.

R.

Raynouard, literature of Provence, 108; excellence of the work, 108, 109; importance of the study of the Provençal language, 109.

Record of conversations on the Gospels, held in Mr. Alcott's school, unfolding the doctrine and discipline of self-culture, 156.

Riego Hymn, now the Spanish national anthem, 111.

Rome, Church of, instance of perfidy on her part in the fifteenth century, 21.

Russia, present population of, 119; present views of, with reference to Turkey, 217; condition and designs of, 221; proposition to England respecting the Bosphorus and the Dardanelles, 229; exports into Tataria, *ib.*; expedition to Chiva, avowed design of it, and its bearings upon British interests, 230; national concert, 236; musical instruments, *ib.*

S.

Sale's translation of the Koran, 1.

Schelling's intellectual system, 185.

Schlegel's Dramatic Lectures, soundness of his views respecting the merits of Æschylus, Sophocles, and Aristophanes, 129, 130; and respecting the defects of Euripides, *ib.*; his animadversions on the Electra, 135; his literary merits, 148.

Slavonic language, 247.

Sea Water, recent invented mode of rendering it fresh, 245.

Self-Culture, by Channing, 156.

Seraing, Mr. Cockerill's vast establishment there, 42.

Schubert: *Reise im Morgenland, in den Jahren 1836 und 1837*, (*Travels in the East, in 1836 and 1837*), qualifications of the writer, and character of his book, 150; description of the Castle of Visegrad, 151; of Stamboul ravaged by the plague, 152; and of the locality of the primitive Churches of Asia, 153; present condition of Ephesus, *ib.*; Mehemet Ali's court and personal appearance, 153, 154; description of the Sphinx, 154, 155; journey through the desert, 155; description of an Egyptian caravan, *ib.*; description of Sinai, the desert, and Jerusalem, 155, 156.

Shylock and his bond, incidents of, traced to a Persian tale, 91.

Sinai, description of, 155.

Stage, the modern, immorality of, 144.

Sultan, the title first borne by Mahmood Ibn Sabuktekeen, in the year of the Flight, 393, 81.

THE
FOREIGN QUARTERLY REVIEW,

No. XLIX.

FOR APRIL, 1840.

ART. I.—*Aegyptische Monumenten, van het Nederlandsche Museum van Oudheden te Leyden, uitgegeven op last der Hooge Regering door Dr. C. Leemans, Eersten Conservator van het Museum. 1e Aflevering. Fol. Leyden. 1839.* (Egyptian Monuments of the Dutch Museum of Antiquities at Leyden, published by the Authority of the High Government, by Dr. C. Leemans, Chief Keeper of the Museum. 1st Livraison. Fol. Leyden. 1839.)

THE extent of the discoveries in the science of hieroglyphics, and the application of their principles to the numerous monuments and remains scattered along the valley of the Nile, or preserved in the museums and cabinets of Europe, have not as yet been adequately appreciated by the investigators of archæological science. Vague and suspicious doubts of the accuracy of the theory have been uniformly started by those who have not taken the trouble to investigate it. The beautiful chain of deductions by which the conclusions of the hierologists have been arrived at, has been the source of constant disputation, and, in consequence, the path has been embarrassed and the career retarded by the necessity of a reference at each stage to first principles, and no allowance conceded to the results of the time and labour bestowed upon this difficult analysis. Yet what have been the *results* of the labours of Champollion, Rosellini, Salvolini, and others, as far as the analysis of the text is concern-

ed? In the Pantheon, the names, titles, and attributes of all the principal deities, and of most of the inferior types, have been identified or discovered. The accuracy of the information handed down through the suspicious channel of the Greek authors has been thoroughly tested; and the inquirer of the present day has, as it were, taken a fresh observation at the very sources from which their information was derived. In history the chronologies of Eratosthenes and Manetho have been verified, the conquests and tributes of the magnificent eighteenth dynasty, in all the pomp of their Diospolitan splendour, of which hints are thrown out by Tacitus, and which were recounted to Germanicus, have been again investigated, interpreted and explained—the papyri, the hieroglyphical records of the myths of the race—the eternal ritual, the “book of manifestation to light,” as it is termed in the native language, has been partially analyzed, and numerous inferior documents, among which the campaign of Rameses the Great, or Sesostris, against the Schetæ stands pre-eminent: all these have been discovered and explained. In addition to the above we may add the religious formulæ, the rites of the dead, the whole vocabulary applied to their zoology, their arts and manufactures, from the smallest amulet to the heaven-capped colossus, from the pompous titles of Pharaonic pride to the song of the herdsman as his oxen tread out the grain on the threshing-floor, all which have equally obeyed the proposed laws of interpretation. Is such a

discovery a visionary dream? Could the ideographic theories, the reveries of Kircher, ever have led to similar conclusions? While one explorer has successfully attempted the hieroglyphic formulae, another, with equal boldness and success, has attacked the demotic, or enchorial writing, and an approximation has been attained to the meaning of the various acts and deeds, transfers of land, &c., which, under the Ptolemies, were still drawn up in the vernacular. Ere another century has passed the only mystery upon the subject will be, how these texts so baffled the powers of men distinguished for talent and erudition. To what is all this owing? To the penetration and the discovery of Dr. Young, to the indefatigable ingenuity and luminous deductions of Champollion!

Had the hieroglyphics been purely ideographics, or symbols used to express ideas similar in construction to the Chinese, no human ingenuity could have restored the language: because so great are the practical deficiencies, or difficulties, of an ideographic language like the Chinese, that it requires no slight effort of ingenuity, aided by native assistance, to adequately comprehend it. The ingenious and profound Zoega, after deep researches into the hieroglyphics upon this principle, abandoned the inquiry to posterity in despair: the empiricism of Kircher obtained but an ephemeral reputation, and almost expired with its author; the whole tribe of inferior minds who have essayed explanations on the ideographic principle have met with scarcely so fortunate an issue; and the dreams of M. Seyffarth who acts upon a similar principle, tinged with an astronomical bias, are scarcely known, certainly adopted by none but the learned German himself. It is quite clear practically, that there is something radically wanting in every attempt to propound an explanation of a series of consecutive signs, upon the supposition of their being the representatives of ideas, and that upon such a plan no rational conclusion has ever been attained, but that all has ended in puerile attempt or shallow trifling. The Greeks appear to have imperfectly understood the construction of the language, and not to have generally given it a deep consideration; and almost all our information from contemporaneous sources is limited to two Christian Fathers, who wrote when Paganism lingered in the various sects which endeavoured to unite the principles of Christianity with the Protean forms of Polytheism. The passage of Clemens Alexandrinus is to the present day contested, yet he seems to have expressed a loose notion of the Cyriologic principle.

No hieroglyphical documents exist later

than Caracalla, and during the reign of Hadrian they exhibit all the traces of the most rapid decay; which circumstance is fully apparent in the bilingual coffins executed at that period. From that time, a few notions excepted which were grafted into the creed of the Gnostics and Basilidians, little was known of even Egyptian monuments themselves till the seventeenth century; at this period many of the cabinets and museums of Europe possessed a few specimens, chiefly amulets or fragments of papyri and bandlets, which soon excited the attention of those devoted to the study of archæology. "The Jesuit Kircher," says Champollion, "entered upon the field, and without any hesitation abused the credulity of his contemporaries in publishing, under the title of the *Œdipus Ægyptiacus*, pretended translations of the hieroglyphic legends sculptured upon the obelisks of Rome, translations which he did not himself believe, for he often has the audacity to support them by citations from authors which never existed." Kircher supposed that these symbols were used to express ideas, although a portion of his *Œdipus*, where an alphabet is found, may possibly entitle him to some loose notions of a phonetic system. But his general interpretations are the most audacious and reckless guesses conceivable, since he professed to explain all monuments with the facility of an Egyptian hierophant. Even his erudition is questionable, for he gleaned but sparingly from the authors of antiquity, and his interpretations were adapted entirely to his own views; thus, his genius Mophta, the familiar spirit of his *Œdipus*, was the Caliban of his own imagination; the branch and bee mentioned in a passage of Ammianus Marcellinus, as meaning king, was explained as "apage muscam," or a fly-flap; and, to crown the whole in one work in a manner consonant with the pedantry of his age, he wrote a dedication in Hieroglyphics as well as Latin, Greek, Syriac, Arabic and Coptic. His ambition to live as a miracle of learning for the passing hour did not rest here; he corrupted the Coptic itself, and left behind him a reputation which few will envy. From the time of Kircher till Zoega the monuments remained unexplained, and the learned Dane approached the task with far greater zeal and erudition, as his *folio De Obeliscis* will amply demonstrate. Possessed with a profound knowledge of the Coptic, and an indefatigability of research, he had collected all the materials within his reach from the Greek and Latin authors, to whose authority on this subject implicit and blind submission was paid, and had drawn

up a list of the different hieroglyphics found upon the monuments at that time extant in Europe. His philological labours convinced him that the signs must have been used in combined groups analogous to the Chinese, and Champollion claims for him a vague notion of the phonetic principle. The efforts of Zoega, still upon the ideographic plan, were not crowned with success, for he left the analysis exactly where he found it, and his reputation rests on other and more solid grounds. The inquiry, however, began to excite attention; specimens of Egyptian art, many inscribed with hieroglyphics, were published by various antiquaries, as Montfaucon, Caylus, Winkelman and Visconti, with errors of the most extravagant cast. The Isiac table, a fabrication of a late period, obtained a high antiquity, hawk-headed figures were called priests of Osiris, no compliment to the hierarchy; and the cartouches, the royal names of the monarch, were supposed to separate particular formulæ of prayers; and this down to 1791, but eight years before the discovery of the stone of Rosetta! It is scarcely more than necessary just to mention the guesses of Warburton and De Guignes; for as they led to no result, and were based upon no deduction, they cannot enter into the scientific part of the inquiry. Preposterous antiquity was assigned to zodiacs, and attempts to etymologize the words found in the ancient authors by means of the sparing remains of Coptic, were made with more energy than felicity by Jablonski; Osiris, Isis and Horus, with an occasional Ammon, were the ordinary limits of the Pantheon, and the inquiry being abandoned in despair by men of sounder judgment, passed into the possession of the literary charlatan.

The French invasion of Egypt rent the veil asunder. The march of the French army was accompanied by men of learning and science, and the result of their labours in the great work on Egypt has survived their conquests. The principal edifices of ancient Egypt were designed by them, and far more accurate transcripts than those up to that period delineated of several inscriptions; and by this means a deeper insight was afforded into what the Egyptians were as a people. In 1799 a French engineer officer, M. Bouchard, discovered the trigrammatical stone of Rosetta, a tribunal beyond which there was no appeal. This monument, which the fortune of war presented to the British government, was first analyzed by the late and deeply regretted M. Silvestre de Sacy, in the course of his researches into the demotic or enchorial text, which, as was then believed, was writ-

ten in abstract sonal characters, and was considered less difficult to discover. In it De Sacy recognized a few of the principal names, as Ptolemy, Alexandria, &c. This investigation was in 1802. He, however, appears not to have been sufficiently versed in Coptic to proceed further, and it was soon discovered that the signs were too numerous for the ordinary principles of alphabetic writings. Ackerblad resumed the inquiry in 1804, but two great errors still retarded the advance of the science, since the demotic, enchorial or epistolographic, was believed to be purely alphabetic, and the hieroglyphical purely ideal, and such descriptions answer to neither.

In 1816 Young was the first who successfully attacked the hieroglyphical portion, and he seems to have followed the method of mechanical application of De Sacy, seeking for corresponding phrases in corresponding spaces. He had previously studied the hieroglyphics themselves deeply, and by reproducing similar groups in their demotic, hieratic and hieroglyphical form, he arrived at the conclusion, that although the Egyptians used their symbols for ideas in the current part of the text, that in the writing of proper names of *foreigners only*, they turned them from their ordinary application to a sonal or phonetic use, and he discovered by this means the cartouches of Ptolemy and Berenice; his analysis was not complete, his parallel to the Chinese inaccurate, but he laid the key-stone of the arch, and the merit of the discovery rests with him. His illustrious rival, who had laboured upon the solitary subject of Egyptian antiquities from his youth, while Young was occupied on philosophy, where his discoveries were equally brilliant, and whose life is at present in the course of publication by Professor Peacock, caught at the discovery as a ray from heaven. He commenced his career upon this basis, and not with the best faith, and announced that the Egyptians used their language in such a manner in the names of foreigners only, and correcting what Young had supposed to be syllables to letters, identified the names of the Ptolemies and Roman emperors. Here he rested; but in his letter to the Duc de Blacas, in 1822, he extended his researches to the names of the native monarchs, and gave a rude sketch of Egyptian chronology, principally from the monuments of Turin. In 1824 he pushed on still further to the names of Egyptian deities, to an extended alphabet, and a few slight grammatical forms. The discovery had now gained ground: the government placed the Collection of the Musée Charles X. under his superintendence, and the catalogue of

that collection manifested the rapid strides made in the decyphering. In 1830 the French government, always attentive to national honour, sent him, accompanied by a commission, into Egypt, and the Egyptian grammar, his visiting card to posterity, as he called it, which is now appearing, and the monuments of Egypt and Nubia executed under his inspection, were the results of his labours. Previous to his embarkation he had discovered the historical papyri of Sallier, and the greater part of his time up to the hour of his death was employed in perfecting the revision of his great work. It is not to be supposed that his labours passed uncriticised, as it is easier to sneer than to learn; he was attacked right and left, and the most formidable of his opponents, M. Klaproth, assaulted the discovery with that sarcasm which he always aimed at men of merit. The system of Champollion has, however, triumphed; the grand theory that the text of the inscriptions consists of two classes of signs—phonetic, or those used to express sounds, and ideographic, or such as are employed for ideas—has been adopted throughout Europe. In M. Salvolini he left an apt pupil, in M. Rosellini, an enlightened coadjutor and supporter; at Turin the Abbé Gazzera and the Chevalier St. Quintino have publicly recognized it; in France it has been acknowledged by MM. Letronne and Ienormant; in Prussia by the Chevalier Bunsen and Dr. Lepsius; in Holland by Dr. Leemans; in England by Sir J. G. Wilkinson, Messrs. Hoskins, Tomlinson, and Birch, &c.: Mr. Salt at once appreciated its utility, and endeavoured to advance it, and the majority of those competent to judge from studying it professionally and not discursively have acceded to the truth of it. Some of the objections which have been raised, may as well, for the sake of curiosity, be stated. The principal one is, that the hieroglyphics are ideal in the body of the texts, which is disproved by resolving them into analogous Coptic phrases when so transcribed in the portion of the text of Rosetta; another is, that the arrangement of symbols does not always quadrate with their relative position, which is admitted, on the other hand, to arise from the mixed character of even phonetic symbols; a third objection is, that the sacred dialect must be considered as distinct from the vernacular, and that it was Hebrew; to disprove which few words will suffice, since the Jews in their intercourse with the Egyptians required interpreters*—M. Quatremere and a host of Coptic scholars have vindicated the idiosyn-

crasy of the Coptic. Where indeed are the remains of an extinct language to be sought for but in its locality? Supposing the language lost, might not Greek be partially restored from Romaic, Latin from Italian, and Sanscrit from Bengali? The critical researches of M. Quatremere into the history of the language and literature of the Copts will abundantly establish this position. The last straw aimed at the discovery is, that the Rosetta stone is a rank forgery.

Independent of the extrinsic truth of this monument, such as it offers to the eye, and which is rather matter of feeling than expression, the Rosetta stone gives an additional guarantee from the fact of the Greek part having passed through a critical examination from at least two Greek scholars, and one of them Porson. The whole objections victoriously refute themselves, and the commanding attitude the study has assumed, no longer in a feeble infancy, but gradually growing to its manhood, now receives both the sanction of scholars and the patronage of most governments.

From the period which has elapsed since the death of Champollion up to the present day the inquiry has maintained a steady increase, though not in proportion so rapid as under the auspices of its illustrious founder. M. Salvolini, who dedicated a considerable portion of his time to the verification of the results of his distinguished master, has attained high distinction by his publications. These consist of an inquiry into the notation of dates, in which the subject was treated more critically than Champollion had time or taste to bestow upon it; some account of the manuscripts of M. Sallier d'Aix, written in a bold hieratic character, and one of them embracing an apparently metrical version of the campaign of Rameses the Great against the Schot or Schetæ, (Scythians,) and another work still more distinguished for the labour and care bestowed upon it, the Grammatical Analysis of the Hieroglyphical Portion of the Rosetta Stone. This analysis, which embraces a most extensive alphabet, and a critical inquiry into each group of characters supposed to contain a phrase, something similar to the attempt of Young, published in the *Hieroglyphica*, is unfortunately imperfect; for the hand of death was already upon the young savant during its progress. The MS. was never completed, and his papers have passed into the possession of the Sardinian government. In France, the care of editing the Egyptian publications has been confided to M. Champollion-Figeac, but he cannot be considered as having advanced the study in any respect, and the second part of the Egyptian Gram-

* Cf. Ps. LXXXI. v. 5.

mar exhibits the most flagrant errors. M. Lenormant, who accompanied the French expedition to Egypt, appears to be far better acquainted with the subject; but as it requires a singleness of study to attain any thing like perfection in it, and M. Lenormant's researches are more generally devoted to Hellenic remains, it does not appear likely that it will be much advanced by him. Rosellini, who had at an early period embraced the new doctrine, stands alone in Europe with regard to the extent of his works, and under the auspices of the Tuscan government has effected more to popularize the study than any of his contemporaries. Three volumes of text upon the historical portion, and three more upon the civil life of the Egyptians, embracing Egyptian philology and archæology, attest the zeal of his application, accompanied as they are by four folio volumes of plates, drawn in Egypt and executed in Italy under his care. In the Memoirs of the Academy of Turin some papers will be found, drawn up by the Abbé Gazzera and the Chevalier St. Quintino, explaining some of the monuments of the rich museum of that city; and in the Archæological Institute of Rome the study has been successfully and critically pursued by Dr. Lepsius, both as regards the monuments themselves and the philology. A joint work, to be published by the Chevalier Bunsen and the above-named scholar, is about shortly to appear in Germany: it will embrace what is much needed—a critical inquiry into the Greek authorities, and the hieroglyphical texts referring to the chronology and history. In England, and by the English in Egypt, the pursuit has not been neglected. Sir J. G. Wilkinson, the well-known author of the *Materia Hieroglyphica*, the *Topography of Thebes*, and a more recent account of the *Civil Life of the Egyptians*, has advanced the study, both by the copying of the more important monuments, and some slight philological efforts, having at an early era recognised several of the more prominent words and expressions. Mr. Salt's little essay was an attempt, however imperfect, to extend our information in this branch; and the *Excerpta Hieroglyphica* of Burton is a collection of excessively valuable drawings, which will always be a text-book on the subject. To the *Coptic Grammar* of Tattam is appended a sketch of a demotic vocabulary by Young, the only one, with the exception of that of Spohn, (which enjoys no very high reputation,) extant; and in the *Transactions of the Royal Society of Literature*, which, under its original appellation of the *Egyptian Society*, published the *Hieroglyphica*, a collection of inscribed monuments, in three volumes, essays have appeared from Col. Leake, the Rev. Mr. Tomlinson, and Mr. Cullimore. More recently, the quarry-marks found in the great pyramid, and the coffin of Mycerinus, discovered in the third by Colonel Howard Vyse, have been published by that traveller, and accompanied with explanations of the hieroglyphical portions by Mr. Birch, have been translated by M. Lenormant into French, from the English. A sketch of a hieroglyphical dictionary has also appeared, by the same party; and there is every prospect that these publications will receive additional support in this country. In Holland the late M. Reuvens slightly added to our knowledge of the demotic; and his successor at the Museum of Leyden, the editor of by far the best edition of *Horapollo* extant, and of the royal names contained in the Museums of Leyden and London, devotes almost the entire portion of his time to the investigation of the branches of Egyptian archæology; and the work whose title appears at the head of this article owes its appearance to his zeal. In Prussia Kosegarten has attempted the demotic. *Fervet opus!* time and application will gradually unfold the meaning of the inscriptions upon the colossus, the papyrus, and the tomb, and more will be known of the Egyptians than of any other people of antiquity, since no such insight into the past as the perfect preservation of the mummy presents, can be obtained with respect to any other nation.

Hand in hand with the hieroglyphical inquiry has proceeded the knowledge of the Coptic, which it is unnecessary to trace here from the period of Kircher to the present day, as it has already received an exposition, as entertaining as it is lucid, from M. Quatremere: yet the same age which has seen the revival of hieroglyphical philology has not been slack in spurring onward the acquaintance with the vernacular. A *Coptic Grammar and Lexicon* have issued from the Oxford press, drawn up by the Rev. Mr. Tattam, who has just returned from Egypt in his search for manuscripts; another *Lexicon* has also been published by M. Peyron. The *Lexicon* of Tattam is unfortunately drawn up in such a manner as to be of difficult consultation for the hieroglyphics, and the supplement which is appended requires total revision. His *Grammar*, too, is a mere sketch, the rude outlines of what the language is. Another *Grammar*, in a fuller form, for the use of the hieroglyphical student, has also been published by Rosellini; yet something is still wanting for a better acquaintance with the Coptic, of which the printed works, as well as

manuscripts, are rare ; and it is to be hoped that some of those multifold societies that are daily rising up will undertake the charge of the publication of the Coptic versions, martyrologies, and liturgies ; for their use can even at the present moment be hardly esteemed too highly, since it is evident, if the Coptic contain, as it is supposed to do, all that is left of the archaic tongue of the country, of the sacred dialect, as it was named in the time of the Ptolemies, all critical knowledge of the dialect must hang upon this at present slender thread. Adequate praise can scarcely be lavished on the *Lexicon* of Peyron : it is essentially the work of a scholar ; it throws out all expressions which are not apparently those of the Egyptians, and does not embarrass the student by a mass of Syriac, Greek, Latin, and Arabic phraseology. The words, too, are arranged under their roots, according to the consonants of which they are composed ; and although this presents difficulties to the tyro, it enables the hieroglyphical inquirer to discover at a glance whether a particular word has disappeared from the ancient language or not. As the Coptic is the remains of a tongue *per se*, and as the Semitic words are infusions from without, and must be used with judgment and in a subsidiary point of view, it is with this *Lexicon* in hand that the inquirer can alone proceed in security ; and when a deeper acquaintance with this language has been cultivated, which apparently touches upon the Indo-Germanic as well as the Semitic, it will then, and not till then, be decided to what extent and under what restrictions the Semitic branch may be used. Until that period has arrived the hierologist might as safely take up the *Dictionary* of Johnson, because *oeit* in Coptic bears an analogy to *white*, *abot* to an *abode*, or *shot* to *shoot* ; yet these terms are nearly equivalent in both languages, and as far as the body of the words of the two languages is concerned, a stricter analogy between the English or Germanic and the Coptic could be traced than between the Coptic and the Semitic dialects. We are indebted to the Coptic for almost all that is known of the construction of the hieroglyphical language ; and by the parallelism of the phonetic groups with the Coptic, we can trace the substance of the hieroglyphical inscriptions ; for the meaning of ideographic symbols has been principally discovered through it ; since the number of symbols explained by Horapollon, which symbols have a relation with the *kyriologic* of Clemens, is of an extremely limited description. It is in the Coptic, in the analogy of the Coptic and hieroglyphic, in the conviction that between the Coptic

lexicon on one side, and the monuments on the other, lies the recondite meaning of these records, that the discoverers and investigators have found their stronghold. Without the Coptic the paths of discovery must have been two centuries behind, and perhaps lost for ever ; since no mental assurance could have been conveyed that the Arabic or Hebrew were analogous, much less identical, with the language. The Coptic, on the contrary, presents a sure and unerring guide ; its dialectical variations are few and simple, chiefly vocalic, its construction easy ; it is a language soon acquired, and when compared with the hieroglyphic, its difficulties vanish ; for while in the Coptic various expressions are ambiguous, because the whole elements of the language are contained under a few sounds often expressing multifarious ideas, which the determinative image of the archaic language of the monuments clenches, the hieroglyphics from this very reason present a beautiful species of formation which leaves not the lingering shadow of a doubt upon the expression ; and nothing can be more certain than the roots and etymology of the hieroglyphic, nothing more vague and ambiguous than the Coptic. The same broad distinction, in fact, which exists between the written and spoken language of China, prevails to the same extent between Coptic and hieroglyphic : the one is a sonal type, allusive to the eye ; the other a bold, and often equivocal expression to the ear. The keys of the languages are the determinations, and these exist in the archaic only.

It is possible that the language, in its primeval development, was entirely symbolic, and that its elements became subsequently adapted to the purposes of sound ; but, if so, where are the primeval forms ? There is no monument extant in Europe in which the whole or even the greater portion of its text is symbolic. The monuments of Cheops and Mycerinus, which ascend upon Rosellini's chronology certainly beyond two thousand and eighty-two years previous to the Christian era, exhibit the most unequivocal marks of a formed and perfectly developed language. The same words, sound for sound, element for element, descend to the epoch of the Lagidæ and the Romans ; and it is not the fact, as asserted, that the archaic monuments exhibit a greater proportion of ideographic ideas, but that they express more forcibly, because more simply, their intent by the use of certain signs universally adopted for particular expressions ; the process of change being not that of language, but of calligraphy. At the earlier epoch the number of Symbols is more restricted

and less interchangeable. During the sway of the eighteenth dynasty a greater floridity of writing prevailed, and under the Ptolemies a still greater infusion of interchangeable forms, and a strange admixture of bizarre and fantastic modes of expression, not merely in foreign names and unusual formulas, but even in the appellatives of native deities and ordinary words. The wear and tear of ideographical languages is apparently less than of the alphabetic; they are early organized, admit with reluctance of impressions from without, and stand uninjured by the changes of tones and expressions.

Nor are the changes of style much greater; for, from his Holiness, as his pontifical majesty was termed, to the scrawler on pottery or papyrus, all had imbibed their education at the hands of the priests, and one large class of monuments, the sepulchral, offer formulas dolefully monotonous; dedications to the gods, prayers and invocations to deities and priests, registers of family names, titles and epithets, seem to have been mostly derived from a common stock. At an earlier period the names and epithets are far less pompous; but the progress of luxury, the pomp of victory, of foreign wars, brought with them panegyrics more loaded and adulation more fulsome. The functionaries, previous to the eighteenth dynasty, do not appear to have enjoyed those pluralities, which their successors under Rameses and the Psammetici held. Their highest epithets seldom mount beyond "seated in the heart of the king," the "eyes of the king," and they seem to have seldom omitted a recitation of their keeping the festivals of the gods. But at the eighteenth dynasty, when the historical style commences, when the temples were made the depositaries of the records of triumph, a haughtier tone commences, epithets labour, and the functionaries of the government in accordance with the spirit of the age, catch the infection. Functions multiply, priests, prophet-priests, royal scribes, treasurers, commandants, commissaries, chamberlains, athtophoroi, equerries, seem blended into one heterogeneous mass. Is it wonderful that on many monuments of this period, while the titles have expanded into several lines, the prayer of the deceased is squeezed into the narrow compass of a few symbols, and that the military chief, attached to the charge of the viands, commandant of the troops, military scribe for the troops, in charge of Upper and Lower Egypt, &c. &c. &c. merely requests the goddess Isis "to elevate his head and open his eyes?" Connected with the historical style are all the inscriptions touching on military expeditions, and these, as well as those relating

to civil affairs, are far more difficult to explain, since they occur less frequently, and are dependent on the context chiefly, and the scenes in which they are represented. Yet the principal work of Egyptian literature is the Ritual, and the style in which it is written bears great analogy to the sepulchral; it consists indeed of a series of prayers, alluding rather to the mythology than explaining it; the general tenour of its tone, as it is more frequently repeated, and on this account more susceptible of collation than any other, is perfectly analogous to that of the sepulchral monuments.

Whether in its full form, or in its abstract, from the ample copy, which, in more flourishing periods, was deposited with the dead, or in the abbreviated pieces in later ages, it presents an integrity of design, which shows that all are transcripts of an archaic original, and it contains a variety of symbols and expressions hardly met with elsewhere. It is far simpler in its style than the historical texts, and although from its nature of a reputation less brilliant and attractive than the compositions referring to other subjects of a historical or civil nature, yet in the solution of the Ritual will be found the great arcana of the religious style, and the purport of the principal formulas which adorned the walls or the entrance of the tomb.

From this part of the subject we naturally arrive at what is far more important, the actual state of the application of the discovery at the present day, the prospects it opens for the future, the results it has realized for the past! Its course has been traced from the spring-head to its embouchure, from the general principles to the minuter working out of the immense detail which lies before us.

Look at the colossal works, abounding in more inscriptions than all Greece and Rome have left behind them as the records of their story and their conquests! and the boldest imagination, the most unwearied assiduity must rejoice and quail at the same moment before its task. The quarter of a century has brought back the ancient history of a people, almost the first-born of the human race, whose luxury and whose conquests, whose arts and whose sciences, had attained their meridian bloom when the buds of Greek ideality and Roman conquests were in their germ. Centuries have rolled on; decads of centuries have past. Persians, Greeks, Romans, Arabs, have each and all in their turn captured, plundered, mutilated the works of art and monuments of this people—still do they remain, though broken and mutilated, the proudest monuments of the hand of man, bearing upon them in the

desolation of the desert, in the hum of the city, the inscribed records of the magnificence of their creators, before whom the Cyclopien constructions dwindle down to the efforts of children. They remain like the gigantic fossils of an extinct world, the silent witnesses of the mighty dead, only awaiting the rising beams of the dawn of discovery to draw from them, like their own Memnon, the broken and articulated sounds of what they were.

The first point to be obtained is an intimate knowledge of the texts themselves, and this can only be supplied by the most assiduous research into such documents as the Dutch government has published—bilingual monuments. Unfortunately they are few in number, executed at a period when the hieroglyphical inscriptions were gradually giving way before the political changes consequent upon the Greek and Roman domination. As the Rosetta stone is the very *pierre-de-touche* of the hieroglyphics, so are the Antigraphs of Grey and Casati, and the Gnostic ritual of Leyden, the alpha beta of the demotic, enchorial, or vernacular; for the demotic varies exceedingly from the hieroglyphical, much indeed from the hieratic, or written form of the hieroglyphic: and this variation is not merely of form but of idiom; for while the hieroglyphic is a dialect of the Coptic, differing considerably in construction, the demotic approaches much nearer the Coptic itself both in construction and the *copia verborum*. The illustration consequently afforded to the demotic or popular writing through the hieratic, though important, is not complete. Now this is the very result likely to be arrived at; for is it not more natural that the enchorial, which does not appear till the Ptolemies, and vanishes under the Romans, should be the ancient language in its transition, than the converse? Who (except a French savant) ever expected to read the monuments of Cheops, executed above two thousand years before the Christian era, with the same facility as his *Moniteur*, because he was intimately versed in the Coptic Bible and a few Coptic martyrologies? One might as well hope to translate fluently Saxon chartularies, because the translator was acquainted with English of the nineteenth century. There is another difficulty. Till the Roman epoch, the hieroglyphics themselves are clear and distinct in their forms, and experience points out what is meant for hawk, what for a sparrow; but the demotic is far more complex, abounding in sigla often indistinct, frequently written *currente calamo*, with little attention to clearness and calligraphy. The Greek official documents

of the Ptolemies, executed simultaneously, offer equal difficulties of decyphering; yet for these the decypherer is prepared with ample lexica, a critical knowledge of the language, and the whole artillery of the mythological allusions. For the demotic he has none of these; he has to grope his path through bilingual monuments, to stop at every step, to verify every result, and to curb his imagination by his judgment. He has at the same moment to grapple with the language and the indistinct and frequently amorphoid sheath in which it is enveloped.

Fortunately the chief interest of the demotic is philological, for the documents hitherto discovered are either sale registers, petitions, or epistolary effusion—the Gnostic ritual of Leyden excepted; and this document will now receive considerable illustration from a Greek papyrus, on a similar subject, on the eve of publication. The paucity of demotic manuscripts and remains is also no ordinary barrier to the progress—they are scarcely a tithe of the mass.

The next point to the study of bilingual monuments is the collation of texts having for their object the same formulas; and the published monuments of the Tuscan and French government are generally executed with sufficient care to render a reference to the monuments themselves unnecessary. The abundance of these monuments indeed is the very life-spring of the inquiry, which rests upon a chain of deduction, for what occurs in a single instance may be the result of error, or an imperfect form; while what occurs uniformly, in two, three, or ten thousand, assumes an approximate ratio of correctness. The same texts vary; the scribe here from local circumstances, or from caprice, from the want of settled orthoepy or orthography, preferred in this expression, or in that, a character or a word different from his fellow-writers of another locality or epoch, and the result, the equivalent variant, adds to the stock of symbols known to express similar ideas or similar sounds. A form, too, which frequently occurs as an abbreviation, such as are common to monumental inscriptions of all epochs, is suddenly presented in its full type, and the mystery stands denuded; it is the same manner of investigation which is pursued for the elucidation of Latin and Greek monuments, and triumphantly for all.

From an imperfect knowledge of texts, the greatest embarrassments and absurdities have sprung. Garbled successions of kings (whose appellations, frequently uncouth in themselves, have been nicknamed horribly) have obtained an ephemeral cre-

dence, and their relative position has been pointed out, because one appeared first and another last in an inscription by persons unqualified to read two consecutive words, much less lines, of the text; vilifying, by their absurdities, those who are engaged in the legitimate path of induction; and this from men possessing an acquaintance with the monuments themselves, rushing into unhappy interpretations in despair, or clinging to departed errors with the most lamentable fatuity. The attempt has been too great: before the cartouches can be decyphered, the language must be at least partially understood. The cartouches are not the first, but the last, in the series: their etymology and their arrangement itself depends upon an *à priori* knowledge of the spirit of the language, and not the language upon a knowledge of the royal names,—this is taking the bull by the tail, not the horns. Perhaps too much authority is still paid to the Greek lists of Manetho, which have gained little in accuracy by their transmission, and may be pronounced far too corrupt to be accepted, except with the suspicious eye of true criticism. Much time has been lost in endeavouring to assign corresponding values of the Egyptian to the Greek names; this was natural at the commencement of the investigation, but is now not requisite. Either a better authority than the versions of the priest of Sebennytus exists, or none at all. The future then is pregnant for the inquirer with the satisfactory identification, not merely of the names of monarchs, but their conquests, their history, their successions, the constitution of their courts, their panegyries or cyclary festivals, their devotions, and constitutions. Other documents attest their magnificence and their pride, but a hope—a cherished hope, *exists*, that varieties may turn up among the papyri similar to those of Salleir and Anastasi, at present in the national depository of this country, records like those triumphant chants over the Scythians and the Ethiopians, approaching more closely to what, in the present acceptation of the word, is strictly history; for the inscriptions sculptured and painted upon the walls of temples are merely the skeletons of the past, the exparte statements of conquest, without a whisper of defeat. “We give you,” say the gods perpetually in these monuments, “Kushkush, or Ethiopia, under thy sandals; we make thee lord of the north and south; we confer on thee power, life, and stability; we make thee giver of life like the sun; we create thee lord of all lands and countries.” Proud records of the conquerors, the struggles of the subdued are painted by imagination and

mantled in silence! One most important document mentions the tribute of the Shôt, who may perhaps be the nomadic race of Skuthoi or Scythæ, the desolators of Asia-Minor. Others in their accompanying scenes point out the direction of the march to Syria, Judæa, or Nubia. Infinite tribes whose names have never reached the Greek geographers, and whose power never attained the consequence of a nation, lie prostrate, smitten before the haughty monarchs of Egypt,—“the kings of the upper and lower worlds, the lords of diadems, the Hori mighty in truth, the lords of the world, the gracious gods, the sons of the sun, lords of strength, hawks of gold, smiters of the world, lions among the shepherds.” In some instances the countries are identified—as Naharaina, or Mesopotamia; Toshir, the Red Land, or Egypt; Maghedo, Joutamelek or Judæa; Lutannou, Lydia; Phars, Persia. In this division alone the magnitude of the field is such as to afford materials for a succession of illustrators of more than one generation. Turn from the history to the religion, and the due unfolding of the pages of the Ritual will demand more than one life—that Ritual, whose dim image is reflected in the Gnostic one before us, containing the prayers uttered upon the funeral ceremonies, and the progress of the deceased through the Amenthes, or purgatory. He addresses invocations, in his advance, to each deity; to Meui, in the solar abode of the two truths; to the bari, or boat, of the god Chnouphra, as it navigates the pool of truth; to the solar abode; to the Bennou, or nycticorax; to the bier of Osiris; to the cow of Athor; to the chest of Osiris; to the mystic sycamore; the cat, Tori, the cynocephali; Iohkhons, the lunar Hercules; eleven times to Thoth, “to hallow him, the deceased, like as Thoth has justified the words of Osiris against his wicked enemies;” the head of Nofre Athôm in the lily; the swallow nourished with the scent of fire; the sowing and reaping in the fields surrounded by the mystical Hapimou or the Nile. When he comes before the Osirian Pluto and the forty-two jurors of the dead, the balance, the Ouemti or devourer of the impious, the Kerberos seated on his gate of flame in the palace of truth and justice; when the deeds of the body, typified as a heart, are weighed against the light ostrich feather of truth by Anubis and Thoth, or the Hermes psychopompos, as the deceased utters his negative confession, addressing each by their name,—“I have not been idle, I have not lied in the tribunal of truth (legal perjury), I have not committed adultery, I have not slaughtered the oxen of the gods,

I have not falsified money, I have not caught the oxyringi, and birds of the gods, I have not polluted the pure waters of the god of my country; I am pure, make me pure, justify before the balance."

The same individual mentions these gods as those "who are fed with the blood of the wicked," calling upon Osiris to address to him their names, and after passing through the terrific ordeal, still wending onwards through mystic region after region till he arrives at the last gates of hell; passing intact the burning pool of the Egyptian Phlegethon vomiting its volcanic jets of flame, those gates which, leading to the north, west, south, and east, are unbolted by Thoth to let the soul pass to the manifestation of the light of the sun, from which, in the Noutehir, or divine subterranean region, it had been excluded—that sun, in whose light he was to bask for ever, and whose two outstretched arms are ready to receive him.

How many invaluable allusions are there here. In the same, Seth, or Typhon, is mentioned as "the lord of the Red Land, the guardian of the gate of hell," like the Etruscan Charon; and the whole abounds in allusions, not always clear, but occasionally analogous to the Greek mythology. Who shall presume to interpret the mythology of the Egyptians, without analyzing it? It would be like giving an account of the religion of Bramah without consulting the Vedas, or describing the Jewish ceremonies without drawing from the source of divine inspiration! The subjects upon the walls of the temples being more pictorial, have been more popular. Yet, as far as the Ritual can be decyphered, it is more important; no one in Europe has hitherto publicly essayed it, although Champollion and Salvolini have used it in illustration. The analysis of the whole would be the *coup de grace* of the system, for almost all the papyri deposited with the mummied dead are repetitions of this great formula or prayer-book, the nearest complete copy of which is in the Turin collection. When will the keepers of those monuments awake from their apathy, and impart to the world the treasures which they guard with dragon-eyed suspicion? It is time to turn to another branch less generally fascinating—the astronomical projections found on the ceilings of the Ramesseion, of the temples of Dendera and Esnah, and of the walls of Ombos. What is the value of these works of art till a satisfactory solution can be arrived at of the meaning of the explanatory inscriptions which accompany them? The authority of one of them, to which the wild opinions of certain archæologists attributed a high antiquity, in order to

detract from the merits and truth, as if it were possible, of inspired writ, has not only been impugned but overthrown, shattered to fragments. The meaning of these projections, whether genethlia, of the Pharaohs, or connected with the heliacal rising of the dog-star, must await the solution of the fated Œdipus, who comes provided with a knowledge of the sacred writings; to none other, assuredly not to the vague essay of the uninitiated, will the Sphinx confess that her riddle is read. Now these subjects have been but very imperfectly treated. The labours of M. Rosellini have been confined to the Egyptian texts relative to the pictorial representations in the tombs, and these are by far the class of symbols the most difficult to interpret, because they are more seldom reproduced in the sacred language; and whether from the extremely difficult nature of the subject or not, the laborious deductions of the learned Italian are more distinguished from their extent than their brilliancy or originality; in this division, then, much lies open for correction and fresh observation. Throwing aside the results obtained from a sufficient knowledge of the inscriptions, without reference to the important conclusions arrived at—so important for the knowledge of the particular arts and sciences attained by the inhabitants of the Nile, there yet remains a branch scarcely less varied, and certainly not less delightful, to those engaged in philological and critical examinations into languages, and that is, the study of the language as a language, the taking to pieces of the complex machinery of which it is composed, and the admiration of the harmonious adjustment of the whole. Here the genius of Champollion pervades without a rival. In the hands of Young, (waiving the asserted claims of the guess of M. De Guignes, put forth with more national feeling than scientific exactness by Arago,) the hieroglyphical discovery was the mere block from the quarry which a master spirit had contemplated might be hewn into form. Under the grasp of Champollion, the disordered ranks of symbols, those mute symbols, in the language of a profound and sarcastic Hellenist of France, (M. Letronne,) which each had hitherto interpreted at his pleasure, assumed definite shapes and names. The end of the clue discovered by the one entangled him in the mazes of the labyrinth, but it conducted the other to the very shrine. Rival scales of merit will assign rival values to the great antagonists in the same career, and national feeling will always interfere with the claims of scientific men, who belong to no country, but are the property of mankind in general.

The candid inquirer *must* assign to Young the merit of the original discovery, and allot to Champollion that intuitive power of a great mind, which saw the application to almost its full extent, and that invaluable quality of mental concentration, which, with undivided attention and Herculean application, worked out the whole so fully, that scarcely a line has been added to the great principles of the French savant since his premature death.

Take up the demotic vocabulary of Young, his most elaborate work, and the *Grammaire Egyptienne* of Champollion; and from which does the mind rise with the greatest satisfaction?—there is but one answer. Champollion corrected the syllabic system to the alphabetic; identified and discovered the names of the Roman Emperors and most of the Egyptian monarchs; dissected in the most masterly manner the composition of the texts in their ideophonetic arrangement, to which Young to his last hour could never advance; analyzed the grammatical constructions and forms; translated in many instances integral texts with that pliancy of intellect peculiarly his own, and pre-eminently adapted for a decypherer; he abandoned every erroneous system, and, by means of his profound application, did more for the advancement of the science than his contemporaries or successors. Young, on the other hand, probably from lack of sufficient materials, still more from that of time, and above all, from that power of limiting and controlling the natural tendency of his great mind to diffuse itself upon a variety of subjects, has obtained a considerable credit in more branches than one; but the complete whole is wanting; his demotic dictionary—vocabulary, or what you will—is a mere sketch, upon whose wreck some future inquirer will erect a system far more satisfactory and complete. There is no philosophy in it, no analytical power shown, but a bleak result, and from that very circumstance suspected by the student; this too, where all receive the very elements of the study with doubt and with distrust! It is scarcely necessary to revert to the elementary knowledge of the subject, to the phonetic or sonal hieroglyphics, and the tropical or metaphorical signs, but rather to show the extent to which our knowledge has been carried out by the labours of Champollion, followed by the philologists of his school, the late M. Salvolini, Drs. Leemans and Lepsius, and the few who in this country have directed any portion of their attention to this subject. The alphabet has been all but entirely recognized, and it may be reasonably doubted whether there remain

above fifty phonetic signs whose sonal value has not been identified. In the tropical signs, a smaller proportion, but two-thirds at least of those at present known, have been discovered; the grammatical forms, to a very great number deduced—not merely detached words and a few pronouns, but the affixes and prefixes of most of the cases and tenses; the whole mode of notation, the composition of verbs and nouns, fixed and illustrated, and the exposition of the sentences in which they occur, with copious references of the places where they have been found. The prepositions, properly the affixes of the nouns, have also been identified. The third part of the *Grammaire Egyptienne*, which is on the point of issuing from the Parisian press, will without doubt embrace the syntax of the language, the minor forms of speech, and the *whole* be the text-book of the Egyptian archæologist for the next century. The labours of M. Salvolini have been principally directed to illustrate and prove the correctness of the results set forth by his illustrious master; and certain corrections, some unquestionably judicious, others upon which opinions may vary, are proposed by Dr. Lepsius, who merits the highest commendation for accuracy and research. From these mighty aids the study of the philology must ultimately advance still further. As it stands at present, the whole of the language divides itself into two branches: First, groups forming words, which groups are composed of purely sonal characters. This number is exceedingly limited; it consists chiefly of forms of speech, and words expressing abstract ideas, as the verb *to be*, &c.; secondly, groups composed of mixed characters, partly sonal, and partly metaphorical. This number embraces almost the whole *copia verborum* of the language.

As an instance of the former, may be taken the expression  *ερω*, forming the verb *to be*, &c. and of the latter, the

expression  *weis*. Now the

determinative or tropical form of a disk shedding rays of light identifies the meaning of the sonal symbols composed of the onion and snake, and by such determinatives the whole generic classes of ideas in the language are formed. Thus a cloth wrung to express the water from the soil of the river in which it is found, is gold, and means tropically, “metal,” and *par excellence*, “gold” itself. A goose is universally the tropical

form attached to groups of phonetic symbols expressive of the peculiar species of birds indicated by the sonal symbols; the expressions, for example, opt, hipi, samen, tor, indicate swan, bird, goose, scarabæus. Each is accompanied by the determinative image of a bird, not varied in ordinary texts, although in the highest finished style of art; the particular bird is depicted after the phonetic groups in question.

Similar functions are expressed by like classes of signs; and in other instances symbols more limited, as they appear in single groups, are used for the same purpose; thus, a heron holding a fish is the determinative of the term *hom*, to fish; a guitar, of *nofre*, good, &c.; and several of the tropical signs are limited to one or two groups. In this respect the Chinese and Egyptian are identical in their construction, the same office being performed in the arrangement of the generic ideas; in Chinese, by the elements called, in the Anglo-Chinese Dictionary, radicals, and, in the French, clefs. For

neau, in Chinese is put for a bird

with a long tail, and, joined with specific terms, pronounced *koo*, *hung*, *go*, &c., expresses "kite, goose, duck;" and as in the Chinese the accompanying groups relate to a tropical meaning attached to the characters, as *koo* means "united," *hung* (keang), river, and *go*, I, me, or mine—the etymology of the word is extremely difficult to trace, perhaps derived subsequent to the nomenclature, so, in Egyptian, the groups, although consisting of sound, have an internal strict relation with the etymology, which rarely admit of change or substitution. Here then the identity becomes complete, for every group of symbols in Egyptian, however phonetic, could never be presented to the eye in a purely sonal form, but as part of a language in its construction ideo-phonetic, embracing the inherent qualities of both alphabetic and ideal systems.

The working out of the detail entirely, both as regards the internal interpretation, and even the parts of speech so imperatively required for an elementary knowledge, and still more for a critical acquaintance with the language, demands a zealous application from a mind untrammelled by official duties. This unhappily, in a country where the educated class are overworked, is scarcely to be expected. Yet something has been done to increase our practical knowledge of the texts even here; while abroad in Germany and in Italy the study has been pursued with a zeal and ability, which promises the most brilliant results. To the government of

Tuscany Europe is indebted for the Egyptian education and publication of M. Rosellini; to Sardinia for the accurate labours of the lamented Salvolini; to France for the magnificent drawings of almost every monument which can claim any interest in the country; for the Grammaire of M. Champollion, published at the public expense—for the execution under an enlightened minister of the French and Tuscan expedition. England has followed in the wake; a private individual, Colonel Howard Vyse, has at his own expense broken into two pyramids, and published his researches and drawings in a style which can compete with any of our continental neighbours. Messrs. Wilkinson and Burton have at their own cost in Cairo published lithographic drawings of the most important archaic monuments, and private enterprise fairly divides the palm with the public spirit of foreigners. Though last, not least, the Dutch government throws its monuments into the scale, and reveals the hitherto imperfectly known treasures in Europe itself, contained in the Leyden Museum. Some account of these, enough to excite expectation, and awaken curiosity, had already been published by M. Reuvens, one of the most accurate investigators of the Greek branch of Egyptian antiquities; but public expectation has at length been gratified, and the scholar is presented with the fac-similes of the manuscripts themselves. These were written probably about the second century, amidst the agonies of expiring Paganism, or by some of the followers of those sects, on whom the vague appellation of Basilidians and Gnostics have been conferred. Their value, independent of their relation with these sects, is of the highest importance; for the *character* which fluctuates in its script, between the demotic or enchorial and the hieratic, is interlined with Greek explanations over certain passages more important for the memory. Thus Tat is written over the two symbols ordinarily called Nilometers, and known in the Rosetta stone to express established the $\tau\alpha\chi\pi\epsilon\omicron\upsilon\tau$ of the Copt, in reference to a region under the special patronage of Osiris; and Abbôt, over another region of the same kind, generally supposed to be the Abydos. Above a number of names, the $\phi\rho\iota\kappa\tau\alpha$ $\omicron\nu\omicron\mu\alpha\tau\alpha$ of these writers, which appear to be manufactured with regard to sound rather than borrowed from Hebrew or from Copt, together with some few which seem to be titles of Coptic composition, are written their Greek equivalents, and these equivalents put the scholar in possession of most of the characters employed in demotic to express sounds. Some of these differ from the values assigned by

Young, and each name is accompanied, as in hieroglyphic and hieratic, by a determinative sign, an abbreviation of the well-known symbol of the hatchet for god, deity, &c. In another MS. is a register of flowers in Greek and demotic, some of which have already appeared, through M. Salvolini in his *Analyse Grammaticale*, and these are far less satisfactory, because they are paraphrases, not translations, of the Egyptian terms, like the names of the Ritual, and are consequently no guide to the identification of the alphabet, which is still, in demotic, the great desideratum; there the discovery is quite in a feeble infancy, and while the general meaning of two-thirds of all hieratic and hieroglyphical documents give way to diligence and research, the vernacular, which it had been confidently expected would have at once surrendered to the laws of interpretation, is up to the present hour imperfectly understood. It has had three investigators, Young, Kosegarten and Spohn; three discoverers, Silvestre de Sacy, Ackerblad and Young, besides examinations from the principal persons who have studied the hieroglyphics, as Champollion and Salvolini. Still the difficulty remains, a difficulty which, it is to be hoped, will now be partially overcome by the publication of Dr. Leemans. Educated, as he has been orally by M. Salvolini, and receiving at an early period the Egyptian discovery, then imperfectly known in Europe—the protégé of the accurate and industrious Reuvens, with no restriction upon his time, a lithographic and printing press at his command, and every facility for pursuing the study, a taste for the same manifested in his edition of Horapollo, in his account of the royal names in the British and Leyden Museums—the world has a right to expect at his hands that the study will be not merely illustrated but advanced. The only copy hitherto seen is in Dutch, but in the prospectus there was a promise given that it should appear in French.

We utter our protest against any scientific works on subjects the fair property of the European literary world appearing in such a form, especially on a study limited to few, and requiring too much research to embarrass valuable time with the jargon of the Netherlands. Private feelings ought to give way to public utility. There is even Latin, if the Gallophobia is still strong in Holland; and one distinguished attaché to Holland, M. Siebold, has already found it necessary to have recourse to a politer tongue. But enough of this; a hint may prove sufficient. As far as the plates themselves are concerned, their accuracy may be relied upon. The papyri have been copied by the simplest and

most correct process: a transfer tracing lithographic paper has been laid over them, and the texts traced with lithographic ink through them. Those tracings have been transferred to the stone itself, and then retouched. From such impressions the plates are taken: they are eighteen in number, and fourteen are occupied with fac-similes, the other four with tabular views of the bilingual groups and the alphabet. Among the hieratico-demotic are two portions of Greek, one apparently an invocation to Osiris, commencing *ἐπικαλούμαι σε τον εν κενῷ πνεύματι δεινον αορατον παντοκρατορα Θεον θεων φθοροποιον και ερημοποιον*, &c.—“I call upon thee by name, thou in the empty air, the dread, the invisible, the Lord of all, the God of gods, the destroyer, the desolator,” &c.; for another ritual of the same kind, on the eve of publication, mentions this god as he who makes mankind to love and hate one another, who sows, who blights, &c. The other Greek fragment is an invocation to Typhon, or Seth; Typhon being the Greek name of this deity, to which form Seth is the true Egyptian appellation; and Typhon the type to which he was paralleled by the Greeks. In this part are several mystical names, some possibly borrowed from the vernacular or hieroglyphical titles of the deities; others, as *ἡτα, πυριφαν*, Greek: a limited number, like *ιαω, σαβαω*, Hebrew; and some, as *θουθι τατ σιθου φθαχ*, apparently Copt. In another part is one of those extraordinary invented alphabets, similar to such as appear in Von Hammer's translation from the Arabic, with the key. Two common figures are drawn in the text, the beetle and eye, with their names, *βαχυχ* and *σιχυχ*, whose meaning, if any, is at present unknown. In the duodecimo part will be found some observations exceedingly useful, by Dr. Leemans, and its consultation may be recommended. It will, indeed, go far to assist in a knowledge of the demotic, and supply the want of the grammar of the demotic, which Salvolini intended to have published as an Appendix to the Hieroglyphical and Hieratical Grammar of Champollion, which, it is to be hoped, will appear in its completed form this spring.

In connection with this subject, a publication which has recently issued from the manuscript department of the British Museum may be mentioned. It is a transcription of the Greek Papyri of the institution, without any text or comment, except such as is required to illustrate the apparent readings. This naturally forms a pendant to the labours of M. Peyron at Turin, published in the Academy of Sciences there. No doubt can be entertained that they will be amply illustrated here or upon the continent

and it is to be hoped, for the national credit, that the subject will not be strangled in its very birth. There is now no impediment with regard to the decyphering of these documents; and though they may not be written in Greek so pure, or language so refined, as the authors of antiquity, whose works have been studied and commented upon till they are threadbare, the critic who passes over these documents without interest knows little of the intellectual curiosity or knowledge which characterizes his brethren of France and Germany. As they touch upon the same subjects as the demotic, they are most highly important for examination; and it is to be hoped that some one will come forward to translate and analyze them. The only regret that can be expressed is, that the same accuracy which has been expended in transcribing them could not find leisure from official duties to render them more generally useful by translation and exposition. But to the Rev. I. Forshall, the present secretary and former keeper of the MSS., whose zeal and whose research are only equalled by his penetration, the best thanks of the future inquirer must be gratefully offered for the documents thus placed at his disposal; and it is to be earnestly desired that the Museum will not limit its Egyptian publications to the Greek documents only.

ART. II.—1. *Svenska Folk-Visor från Forntiden, Samlade och utgifne af* ER. GUST. GEIJER *och* ARV. AUG. AFZELIUS. Stockholm, 1 Del. 1814. 2 Del. 1816. 3 Del. 1816. 4 Del. (Musik,) 1816.

2. *Svenska Fornsånger, en Samling af Kämpvisor, Folk-Visor, Lekar, och Dansar, samt Barn-och Valt-Sånger. Utgifne af* ADOLF IWAR ARWIDSSON. Stockholm, 1 Del. 1834. 2 Del. 1837. *Båda med Musik-bilagor.**

It is always with extreme satisfaction that we investigate the contents of volumes like the present. They throw us back at once

* The old Ballads of Sweden, collected and published by ER. GUST. GEIJER and ARV. AUG. AFZELIUS. The fourth volume consists of old Swedish Melodies.

Ancient Swedish Ballads, a Collection of Champion Ballads, Popular Songs, Sport and Dance Rhymes, Shepherd and Nursery Songs, &c. 2 vols. 8vo. Both tomes contain an Appendix of old Melodies.

into a national era, a condition of the popular ranks and a tone of feeling which will never return to us in European life. How fresh, how invigorating are our sensations in mingling once more with the simple habits of the past! The foray, the hunting-party, the pirate expedition, and the battle-field, are continually crossing and intermingling with the peasant's cottage, the flock of the shepherd, and the maiden's amour in the stilly wood. We become familiar with every class, we recognise every *type*. The chieftain, fierce and gloomy—the young knight, “out on adventures”—the eager lover,

“Burning like a furnace”—

and the artless village girl, or the proudly beautiful but simply affectionate high-born ladye, become, as it were, of the same household with ourselves.

But the effect produced by ballad literature is also of a deeply moral character. We become penetrated with the simple virtues of a period when they were characteristic of the population; we learn to sympathize with *man* and *woman*, because we see them nearer, and more unadorned and undisguised, than ever we did before; and we acknowledge and feel as men deep interest in all modifications of our common nature. When thus transported into the past age of simple manners and still more simple passions, the contrast between our own world and that of the minstrel-poet becomes so complete, that we are compelled to admit more or less of its spirit. Stock-jobbing and steam-engines, cant and centralization, railways and radicals, cease, for a time at least, to haunt our imagination, while we affectionately linger over scenes and lands where the one was unknown and the other would have been a crime!

Nor is this all. Ballad literature has yet another value: it hands down to us features of bygone centuries and practical illustrations of bygone systems, such as we can find in no other quarter. Like the old *Bayeux tapestry*, with its bizarre Viking ships, and mailed warriors, and quaint accoutrements, and parti-coloured sails, and perpetually changing figures, through which we become in the simplest manner acquainted with the habits and dress, and armour and navigation of the Gallo-Scandinavian adventurers, who, 800 years ago, made conquest of our island. Thus does the popular song reveal facts and feelings, customs and costumes, which are in the highest degree important and interesting:—“The king is sitting by his broad board, and is served by knights and swains, who bear round wine and mead. Instead of

chairs we find benches covered with cushions, or, as they are called in the ballads, mattresses (*bolstrar*, * bolsters, long pillows;) whence comes the expression '*sitta på bolstrarna blå*,' on the blue cushions seated. Princesses and noble virgins bear crowns of gold and silver; gold rings, precious belts, and gold or silver-clasped shoes, are also named as their ornaments. They dwell in the highest rooms, separate from the men, and their maidens share their chambers and their bed. From the high bower-stair† see they the coming of the stranger-knight, and how he in the castle-yard taketh upon him his fine cloak, may be of precious skins—or discover out at sea the approaching vessel, and recognize by the flags which their own hands have broidered that a lover draweth nigh. The dress of the higher class is adorned with furs of the sable and the martin, and they are distinguished by wearing scarlet, a general name for any finer or more precious cloth (for the ballads call it sometimes red and sometimes green or blue,) as opposed to '*valmar*' (serge, coarse woollens,) the clothing of the poorer sort. Both men and women play upon the harp, and affect dice and tables; song and adventure are a pastime loved by all in common, and occasionally the men amuse themselves at their leisure with knightly exercises in the castle-yard. Betrothals are first decided between the families, if everything follows its usual course; but love often destroys this order, and the knight takes his beloved upon his saddle-bow, and gallops off with her to his bridal home. Cars are spoken of as the vehicle of ladies, and from an old Danish ballad,‡ in which a Danish princess who has arrived in Sweden laments that she must pursue her journey on horseback,§ we see

* *Bolsters*. A. S. bolster, bolstre; D. bolster, E. bolster, from boll, E. bol (anything round or circular, from bollen. Hine ball and bowl. To boll, also, is to round by circumvolution) and *ster* or *stre*, straw. Thus Chaucer, Knight's tale, Tyrwhitt, l. 2920—

"Of *stre* first there was laid many a load."

A ball or roll of straw.

† The bower-stair, "*Hög Lofts bro*," was outside the building.

‡ The Danish princess, who was to be the spouse of a Swedish king, says,

"Vor jeg i min faders land,
Da fink jeg karm och köresvånd;
Dertill svarade de Svenske fruer:
I förer oss hit inge judske seder."

"Were I in my father's land,
A car I'd have, and driver grand;
The Swedish ladies answered thus,
'No Jutland manners bring to us.'"

Professor Geijer's Note.

§ No doubt a not very agreeable way of travelling far, especially in a period when all, both male and female, rode astride!

that their use did not reach Sweden so early. Violent courtships, club law, and the revenge of blood, &c., which, however, could often be atoned by fines to the avenger, are common.* "We cannot help remarking, also, that the popular ballads almost constantly relate to high and noble persons. If kings and knights are not always mentioned, still we perpetually hear of sirs, ladies, and fair damsels—titles which, according to old usage, could only be properly employed of the gentry. We will not, it is true, assert that the old songs have preserved any distinction of rank; but in the mean time this will prove that their subjects are taken from the higher and more illustrious classes. Their manners are those chiefly represented, and the liveliness of the colouring necessarily excites the supposition that they spring from thence. On the other side, again, they have been and remain as native among the common people as if they had been born among them. All this leads us back to times when as yet the classes of society had not assumed any mutually inimical contrast to each other, when nobility was as yet the living lustre from bright deeds rather than from remote ancestry, and when, therefore, it as yet belonged to the people, and was regarded as the national flower and glory. Such a time we have had; and he only cannot discover it who begins by transplanting into history all the aristocratical and democratical party-ideas of a later time." "Further, we find in the old ballads that there is not only no hate of class, but also no national hate, among the northern peoples. This explains how it is that they are so much in common to the whole north, and this community of sentiment extends itself even to the ancient historical songs."†

The old ballad literature also gains materially by nothing in it being forced. Composed in times when there was neither press nor criticism, affectation nor effect-seeking, premature feeling nor pretended taste, it was the instinctive and gradually moulded speech of heart to heart, relating many a "peril dire" by land and sea, or the real accident of a past age transformed into the rhymed legend of the next—

"While eager groups were gathered round
The wide hearth's blazing light"—

or the poetry of love interpreted in some affecting story to the passionate stripling, or to melancholy age; or the national superstitions clothing with unreal forms the

* Geijer's Swedish Ballads, vol. i. p. 39.

† Geijer's Swedish Ballads, vol. i. pp. 41, 42.

laughing wave and the "everlasting wood." In all these cases the object was simply one—to move. This one point gained, the bard received his well-earned plaudit. The song was eagerly retained by many a listener; and now that age upon age has rolled by, thousands of these fine old ballads live, while the authors of every one of them have long since been forgotten.*

But though the charms of "shepherd-song" are, we doubt not, dear unto many a noble heart among us, the popular songs of the north have an especial interest for the British reader. The little glimpses into the Danish fields of poesy afforded in the volumes of the gifted *Jamieson* were truly characterized as an event in the annals of our ballad literature. Since then no one has endeavoured to pry into and map out for us this unknown land of Scandinavian lore, and the labours of our most illustrious investigators lose not a little of their value from not being properly supported and illustrated by parallels and fillings-up from purer sources. It is now admitted on all hands that a thousand years ago the literature, like the language, of the whole Teutonic north (including Britain) was almost common to all its parts. This result from similarity of origin, belief, Viking expeditions, and clanship, was only gradually broken in upon by an unequally proceeding civilisation, the creation of isolated monarchies jealous of each other, and the growth of the dialect up to the language. Therefore it is that those parts of the great Gothic circle where the alterations have been most extensive must recover much of what is dear to them from regions far from the din of rapid change, and from tribes inhabiting a land where the stillness of the forest and the scantiness of population and communication are most likely to ensure simplicity of manners and purity of song and legend. But just this land, *par excellence*, is the northern peninsula, and especially Sweden. Denmark, which lies so near the heart of

the continent, has suffered much more change in the strife of centuries than either Norway or Sweden; while Norway, again, never had (from political causes which we cannot now stop to investigate) an equally extensive series of romantic ballad reminiscences, and could not preserve the little she possessed from the envy and jealousy of her Danish tyrants. Thus, notwithstanding the very great merit of the Danish ballad collections (called Danish, but in fact also Norwegio-Danish) we do not think they can be esteemed as of equal worth with the similar cycles we now proceed to introduce to our readers.

The publication of Professor Geijer's* first volume, in 1814, excited a very great sensation in the north; and when the work was continued and completed, the effect was prodigious. It called into being a large class of writers, in an especial sense national; it sanctioned with academical approbation the hitherto despised strains of the distant provinces, and gave a value to everything popularly antiquarian, which it has ever since retained. Continuations and reprints at home, and translations abroad,† soon proved that the mine now opened was a rich one. May his countrymen, excited by his example and the labours of such men as Afzelius‡ and Arwidsson,§ continue to work it till they have restored to the bright day the golden treasures guarded by the dwarfs of Neglect and of Oblivion!

In Britain we have unfortunately and unpardonably lost most|| of our ancient ballad melodies; in the north a very large number are happily rescued. To judge of the collections before us without also adding specimens of the music in which they are enshrined, is almost unjust; indeed, in many cases, it leaves us the body, when the soul has fled; but the nature of the Foreign Quarterly Review will not allow us the pleasure of adding any musical extracts. We must therefore be content with the ex-

* Since writing the above, we have found an observation almost similar in its tendency, in a charming little work by a French *litterateur* attached to the late French northern expedition. He is speaking of the story-tellers and saga-minstrels of the old north:—"Pour ébranler leur auditoire, ils ne citaient que les faits les plus dramatiques, et ajoutaient à la gloire du héros et au résultat sanglant des combats. Pauvre naïve ambition! Ces historiens voyageurs, assis à la table du jarl, quand une famille réunie autour d'eux les suivait avec attention, quand un vieux guerrier applaudissait à leurs paroles, ils se croyaient peut-être de grands hommes; et pas un antiquaire n'a pu encore révéler leur nom."—*Lettres sur l'Islande, par M. Marmier*, Bruxelles, p. 257.

* Since so celebrated as the great historian of Sweden.

† *Mohnike*, *Volklieder der Schweden*; *Studach*, *Schwedische Volksharfe*; many ballads in *Grimm*, *Wolff*, &c.

‡ This indefatigable clergyman has just published the first part of a *Legendary History of Sweden*.

§ This gentleman, who is one of the librarians in the Royal Library of Stockholm, has unquestionably surpassed his learned predecessors in the fidelity, sagacity, and research with which he has edited his materials, and his volumes constitute a refreshing example of how such a work ought to be brought out.

|| We except with pleasure those occurring in the last edition of *Sir W. Scott's Border Melodies*, and in *Motherwell's* and *Duunay's* Collections.

planation, that the prevailing tone of these old Scandinavian melodies is simple and melancholy; that many of them have a certain family likeness with the ancient songs of Ireland and Scotland; and that a considerable number are eminently beautiful. The two collections of *Geijer* and *Arwidsson* contain about 120 melodies; and we ourselves have been so fortunate as to obtain, in the country, about 220 more, the greater part of which are copied from a MS. collection in the Royal Library of Stockholm. We give this hint in case, as we hope, any collector or amateur should wish to turn his attention to this subject.*

The contents of the five volumes before us are so various, and an outline at least of their pages so absolutely necessary for every student (and their name is legion) of our ballad literature, that we have found it impossible to give any other abstract than that of a *catalogue raisonnée*. This method, indeed, has caused a large sacrifice of time and labour; but so convinced are we of its being the only way of doing justice to the subject, and so persuaded of its meeting the approbation of the extended and increasing class for whose use it is intended, that we have had no scruple in at once devoting to it the labour required. Indeed an index of such subjects, however constructed, is totally useless, except to one perfectly well acquainted with the contents of each particular ballad. An alphabetical list, which tells us that the song of "Sir Peter" is found at page 50, and that of "Duke John" at page 500, cannot give us the slightest idea of their plot or character. On the contrary, by giving such an outline as the one furnished below, we place in the hands of every reader and investigator, at home and abroad, in Scotland or in Kamschatka, the true key to every song; so that he has a complete *coup-d'œil* of the whole literature in question, can ascertain in a moment whether any particular song or subject is handled in the *Legendary Ballads of Sweden*, and can in one moment turn to the volume and the page in which every such song or variation from the general legend is to be found.

The number of ballads in both works is not less than about 300. These we have, first of all, arranged so as to bring together all relating to the same subject; and we have then reduced the *concrete* ballads into certain easy and naturally distinguished classes. We are far from asserting that this arrangement is faultless, or that every ballad is

always placed in its proper division; for compositions of this class, as our readers are aware, often run more or less into several classes. But we imagine that our scheme is the most useful and applicable in the present instance, and is best calculated for attaining the great end we have in view—the elucidation of the collections at the head of our article, and the practical and permanent service of all interested in their contents. The following, then, is the arrangement we have adopted:—

I. MYTHOLOGICAL AND HEATHEN BALLADS.

II. SONGS RELATIVE TO THE FRAGMENTS OF THE OLD MYTHOLOGY, SUBSISTING IN THE IMAGINARY BEINGS SUPPOSED TO PEOPLE THE MOUNTAIN AND THE WAVE, &c.

III. SPELLS, ENCHANTMENTS, AND WONDERS, &c.

IV. DREAM-LEGENDS.

V. GHOST-LEGENDS.

VI. CHAMPION-SONGS; OR, "THE TWILIGHT OR HISTORY."

VII. SONGS OF TRUE LOVE.

VIII. SONGS OF FALSE LOVE.

IX. MISCELLANEOUS SONGS OF LOVE, WOMEN, &c.

X. MISCELLANEOUS ROMANTIC BALLADS.

XI. CARICATURE-SONGS; OR, PARODIES ON THE CHAMPION BALLAD, &c.

XII. THE HISTORICAL LEGENDARY BALLADS, SACRED AND PROFANE.

Apologising for the title we have given each ballad, in case it should not always be thought the very best we could have found, we now proceed with our resumé, beginning with those of the first class, which are, of course, as rare as they are valuable.

I. MYTHOLOGICAL AND HEATHEN BALLADS.

1. "Offer-Song at St. Ingemo's Well." G. i. 244.* A slightly Christianized chant, reminding us of old gods and ancient rites.

2. "Fetching the Hammer." A. i.; 3, 7. This fine song, *the oldest in the north*, has already been noticed by Rask as remarkably and strongly corroborating the authenticity of the Eddaic legend, relative to Thor's Expedition in Search of his Mace. Of the Swedish copy, for we have also Danish and Norwegian varieties†, stanzas iv. v. vi. viii. and ix. are translated in the "Foreign Quarterly Review," for April, 1829, p. 119. Hitherto, however, it has not been remarked, that if printed, as it should be, in four lines instead of two, we should be immedi-

* It is to Her *Arwidsson* that we owe the MS. collection above-mentioned in the Stockholm Library.

* In these references, G. denotes the collection by *Geijer*; A. that by *Arwidsson*; the Roman numerals the volumes, and the Arabic cyphers the page.

† See the volumes of *Vedel* and of *Syn*.

ately struck with the evident *scaldic* and *alliterative* construction of the verse.

II. SONGS RELATIVE TO THE FRAGMENTS OF THE OLD MYTHOLOGY, SUBSISTING IN THE IMAGINARY BEINGS SUPPOSED TO PEOPLE THE MOUNTAIN AND THE WAVE, &c.

A. Mermen, Mermaids. 1. "The Mer-man deceived, or the Brother and Sister rescue each other." G. iii. 136. Rosmer Havmand, the Danish ballad, of which this appears to be an adapted fragment, is partly translated in Jamieson's *Popular Ballads and Songs*, i. 215.

2. "The Charm, or the Knight that became the Mermaid's Spouse." G. i. 110. A very beautiful ballad. In the British isles, dim fragments of ancient Northern superstitions are every where common; but we sometimes detect resemblances where we should least expect them. Thus we in a moment detect the identity of scenery in this Swedish ballad of "Sir Olof," and in the Irish legend of "The Enchanted Lake."* But how startling is the difference of treatment; how immense the change produced by time and situation! The one is the severe and beautiful image of antiquity and its elf-shapes reflected in the ever-flow-

ing spring of ancient faith; the other exhibits the distorted features of tragi-comic pantomime, flung back by the troubled and muddy waters of confused belief and superstitious ignorance.

3. "The Mermaid† deceived, or the Maiden rescued by her Brother." G. iii. 148, 153; A. ii. 320, 324. We find here a remarkable and spirited description of the sister's toilet in the caves of the sea-lady.

B. Elves. 4. "The (Elf-Maiden) (Water-Witch) will betrothe a good Knight, who escapeth out of her Hands." G. iii. 168, 270, 171, 172; A. ii. 300, 302. The answering Danish song, called "Elvelig,"‡ is already in the hands of our countrymen.§

5. "The Knight Elf-shot, for that he will not join in the Elf-Dance.||" G. iii. 160, 162, 165; A. ii. 304, 307. A Danish parallel to these very pretty songs is found in Jamieson.¶

C. Necken. 6. "Necken, (Neck, Nick) the Water-King,** chooses him a bride." G. i. 60. The mixture of Paganism and Christianity in this ballad, as in many others, is very amusing. The Church is the place of rendezvous. We give four stanzas:—

VII.

The damsel she treadeth within her hall of stone;
"O Christ! that I could claim that good knight for mine own!"
With such honour.††

VIII.

And Necken he treadeth within his hall of stone;
And deep within his heart he longs to call that maid his own!—
With such honour.

IX.

"An' please it ye, fair ladye, to kirk to haste away;
Myself I would so willingly your driver be this day!"—
With such honour.

X.

He gallop'd over water, o'er bridge he gallop'd too;
That virgin ne'er again was driven this wide green earth aboo!—
With such honour.

* *Croker's Fairy Legends of the South of Ireland.*

† Of all ballads on this subject, none equal the beauty of Leyden's "Mermaid," who expressly mentions this story as a Gaelic legend. In the romantic ballad, he was the rival of Scott, and to whom Scott did ample justice. How exquisite are those lines on the mermaid herself:—

No form he saw of mortal mould,
It shone like ocean's snowy foam;
Her ringlets waved in living gold,
Her mirror crystal, pearl her comb.
Her pearly comb the siren took,
And careless bound her tresses wild;
Still o'er the mirror hung her look,
As on the wondering youth she smil'd.

Again, the imprisoned Lord of Colensay:—

And oft, beneath the silver moon,
He heard afar the mermaid sing;
And oft to many a melting strain
The shell-formed lyres of ocean ring.

Border Minstrelsy, book iii. p. 345.

‡ Nycrup, i. 237.

§ Jamieson, i. 225.

|| Familiar to the English reader is the beautiful ballad of "Sir Oluf," (*Tales of Wonder*, Monk Lewis).

¶ Jamieson, vol. i. 219.

** This is also in the above collection, under the title of the "Water-King." We extract two verses:—

The priest said, as the knight drew near,
"And wherefore comes the white chief here?"
The lovely maid she smiled aside,
Oh, would I were the white chief's bride!

Oh, had some spirit deigned to sing
Your bridegroom is the Water-King!
The maid had hate and fear confest,
And cursed the hand which then she press'd.

†† Och fröken bon gängar sig i Stensalen in;
Christ gifve! den Herren han mätte blifva
min!

Med den äran," &c. &c.

7. "Necken, the Water-King, punisheth the proud and cruel Maiden." G. iii. 129, 133. Professor Geijer adds in a note to this song: "The terrible ballad found in Sir W. Scott, under the name of 'The Demon Lover' is fundamentally the same as the above." Of this we are not so certain. They rest upon a different *moral* basis. We translate as a specimen, the following plaintive stanzas:—

XVI.

"Say! where dwells thy father, and where thy mother dear?"
Wake up, now, each good youth; come, quickly wake!
"And where dwells thy kindred, and where each loving fere?"
The young ones sure too long their slumbers take.

XVII.

"My father and my mother, they are the billows blae;"—
Wake up now, &c.
"And friends and kindred have I none, except the stick and strae!"—
The young ones, &c.

XVIII.

"Ah! but so hard, so sad it is, to dwell within the sea;
So many, many over us are rowing constantie.

XIX.

"Yes! right hard it is, to dwell in ocean's deeps, I trow;"—
Wake up, now, each good youth; come, quickly wake!
"So many, many over us are passing to and fro."—
The young ones sure too long their slumbers take.*

8. "Necken, the Water-King, giveth back the Drowned One, for that her Lover playeth the Harp so sweetly." G. iii. 140, 143, 145; A. ii. 310, 312, 315. There is a Danish ballad,† very similar in character. The Swedish copy, p. 140, is so eminently beautiful, that we cannot help attempting to enrich our language with it entire:—

(HARPANS KRAFT.)

THE POWER OF THE HARP.

I.

The youth to court-yard goeth, and gladly sports him there;
The maiden in her bower is sat, and weepeth sair:—
My heart's own dearest love!
Say! who is't ye so sorrow?

II.

"Tell me! some good horse weep ye, or some gold-saddle fine;
Or sorrow ye, regretting, that I've now pledged thee mine?"
My heart's &c.
Say! who, &c.

III.

"Ah! sure, no horse lament I, nor eke gold-saddle fine;
Nor sorrow I, regretting, that ye have now pledged me thine."

IV.

"Then weep ye, that so narrow the saddle ye have found;
Or sorrow ye, lamenting, the long road we are bound?"

V.

"Sure weep I not, that narrow the saddle I have found;
Nor sorrow I, lamenting, the long road we are bound."

VI.

"Mayhap you weep your father, or else your dearest mother;
Or sorrow for your sister, or else lament your brother?"

VII.

"Nor weep I for my father, nor yet my dearest mother;
Nor sorrow I my sister, nor yet lament my brother."

VIII.

"No! much and long I sorrow my fair bright golden hair;
Which, tossing on its waters, deep Värnam soon shall bear;

IX.

"Foretold it was about me, while yet a child at play,
That waves should be my grave-bed upon my wedding-day!"

* "Och hvar har du fader och hvar har du moder?
Vaker upp alla redlige drängar!—
Och hvar har du vänner och hvar har du
fränder?
De unga hafva sofvit tiden allt för länge,"
&c. &c.

† *Nyerup*, i. 236. We may as well mention here, once for all, that we have not added the German and Dutch &c. parallels, &c. It would have carried us too far.

X.

"But I will build a bridge, and strong it shall be made ;
Twelve thousand marks, and more, I wot shall there be laid ;

XI.

"And gallant knights, twice six, before thee there shall ride ;
And twelve good knights, none missing, shall guard thee on each side,"

XII.

So when now they came just half that good bridge o'er,
Her horse, four gold-shoes wearing, all sudden stumbled sore.

XIII.

Full brightly its four gold-shoes and thirty gold-nails gleam ;
And quickly down the virgin falls amid that rushing stream.

XIV.

To his little foot-page, hastily, then thus the youth did say :
"My gold-harp bring me hither, and make thou no delay !"

XV.

The first stroke on his harp of gold he struck so soft and clear,
That Necken on the water sat, and smil'd such notes to hear !

XVI.

His second stroke on harp of gold, it sounded all so sweet,
That Necken on the water sat, and bitterly did greet.

XVII.

"Methinks, young knight, thou playest now in much too hard a strain,
Thy fair young bride nathless, thou soon shalt get thee back again :

XVIII.

"Yes ! back again thou straight shalt get thy young bride rosy-red,—
As though where those deep billows roll she'd ne'er been lying dead !"
My heart's own dearest love !
Say ! who is't ye so sorrow ?*

D. The Mountain-King. 9. "The Mountain-King and his Bride." G. i. 1 ; ii. 201 ; A. ii. 275, 277. The first of these four ballads on this subject we cannot help giving at length, it being characteristic of a large class, and of a still popular northern superstition. The air to which it is sung is exceedingly plaintive. *Geijer* adds (i. 1.) ; —"Many of those ancient romantic ballads, which are still the dearest pastime of the country people on the winter-evenings, are commenced by an introductory relation. This one is among them. The songstress first commences a wonderful legend of the unfortunate girl who, on her way to church, felt herself with irresistible force drawn, as by a charm or enchantment, to seek the mountain-king. After detailing all the circumstances attendant hereon, the song begins :"—

(DEN BERGTAGNA.)

THE MOUNTAIN-TAKEN MAID.

I.

And now to early matin-song the maiden would away ;
Th' hour goes heavy by.
So took she that dark path where the lofty mountain lay :—
Ah ! well sorrow's burden know I !

II.

On the mountain-door she gently tapp'd, and small her fingers are ;
Th' hour, &c.
"Rise up, thou King of the Mountain ! and lock and bolt unbar !
Ah ! well, &c.

III.

The mountain-king rose up, and quick drew back both bolt and bar ;
To his silk-bed blue then bore he the bride that came so far.

IV.

And thus, for eight long years I ween, she liv'd i' th' mountain there ;
And sons full seven she bore him, and eke a daughter fair.

V.

The maiden 'fore the mountain-king now stands with looks of woe :
"Would God ! that straight I home to my mother dear could go !"

VI.

"And home to thy mother dear thou well enough canst go ;
But, mind ! I warn thee name not the seven young bairns we owe !"

VII.

Now when at last she cometh to where her home-halls be,
Outside to meet her standing her tender mother see !

* "Ungersven han går och leker på gården,
Och jungfrun hon sitter i buren och gräter,
Min hjerteliga kär!
Säg för mig hvem I sörjen," &c. &c.

VIII.

"And where so long, so long a time, dear daughter, hast thou been?
Thou'st dwelled, I fear me, yonder, i' the rose-deck'd hill so green."

IX.

"No! never was my dwelling on the rose-deck'd hill so green;
'This long, long time I yonder with the mountain-king have been!"

X.

"And thus, for eight long years, I ween, I've liv'd i' th' mountain there;
And sons full seven I've borne him, and eke a daughter fair."

XI.

With hasty steps the mountain-king now treads within the door:—
"Why standst thou here, about me such evil speaking o'er?"

XII.

"Nay, surely naught of evil I lay now at thy door;
But all the good thou'st shown me I now am speaking o'er."

XIII.

Her lily cheek then struck he, her cheek so pale and wan,
So that o'er her slim-laced kirtle the gushing blood it ran.

XIV.

"A-packing, mistress, get thee! and that I pray right fast;
This view of thy mother's gate here, I swear it is thy last!"

XV.

"Farewell, dear father, and farewell, my tender mother too!
Farewell, my sister dear! and dear brother, farewell to you!"

XVI.

"Farewell, thou lofty Heaven! and the fresh green earth, farewell!
Now wend I to the mountain, where the mountain-king doth dwell."

XVII.

So forth they rode, right through the wood, all black, and long, and wild;
Right bitter were her tears—but the mountain-king he smiled.

XVIII.

And now they six times journey the gloomy mountain round;
Then flew the door wide open, and in they quickly bound.

XIX.

A chair her little daughter reached, with gold it redly shone:
"O rest thee, my poor mother, so sad and woe-begone!"

XX.

"Come haste thee with the mead-glasses; hither, quick, I say!
Thereout now will I drink my too weary life away!"

XXI.

And scarce from out the mead-glass bright her first draught doth she take,—
Th' hour goes heavy by;
Her eyes were sudden closed—and her weary heart it brake!—
Ah! well sorrow's burden know I!*

10. "The Mountain King and his Bride, whom no Charm can make to forget her mourning Mother." G. ii. 22. The power of charms was always omnipotent in Old Scandinavia, especially when not opposed by any counter-charm. That we should find such a remarkable exception as the following, is therefore not less affecting than it is rare and surprising. We give the five last stanzas:—

XXXVII.

The one fair child bore her the brim upfil'd horn,
While the other dropped in it a small gilded corn.

XXXVIII.

The first drink she drank of that high-foaming horn;
Both Heaven she forgetteth, and th' earth where she's born.

XXXIX.

The next drink she drank of the mead in that Horn,
So both God and his Word she forgot on that morn.

XL.

The next drink she drank of that bright flowing Horn,
So both sister forgot she, and brother so lorn.

XLI.

So both sister forgot she, and eke her dear brother,—
But never forgot she her sorrowing mother!†

* "Och jungfrun hon skulle sig åt Ottesången gå;
Tiden görs mig lång—
Så gick hon den vägen åt höga berget läg,
Men jag vet att sorgen är tung," &c. &c.

† "Den ena bar fram det påfyllda horn,
Den andra la' deri ett förgyllande korn," &c. The refrains are the same as No. 9.

11. "The Mountain-King misseth his Bride, before he is aware." A. ii. 295. A somewhat corrupted copy of one of Sweden's few humorous pieces.

E. Dwarfs. 12. "The Knight is released from the Dwarf Lady's Charm, and gains in battle a beauteous Bride." G. i. 32, 127. This is one of the finest and most valuable Ballads in the whole collection, and is full of illustrations of ancient manners and superstitions. Stanzas iv.—vii. are already translated.*

13. "A faithful Lover killeth the Dwarf-King's Daughter." A. ii. 298. In the last verse of this good Ballad, we have an expression, common in British songs, but not so in Scandinavian:—

vi.

Then straightway good Sir Peter
He draweth his *brown* brand,
And off her head he quickly hews,
And thereto her right hand.
For trouble he was offered 'stead of love.

F. The Mountain Hag. 14. "The Knight rescues his Maiden from the Mountain Hag." A. L. 123. This long and precious old song ought to be translated entire, but our space forbids it. Three stanzas, illustrative of the old Scandinavian belief of speech and wit being possessed by the bear, we must make room for. Having lost his oxen in a strange manner,

iv.

Hemming wood and cover seeks,
And each close den he tried,
And finds at last the stark white bear
Suckling her young in pride.
Hemming the young on snow-skate† well could leap!

* Strong's Frithiof, p. 30.

† The following description of the snow-skate may possibly afford some information to English readers:—

"Now was the time for seeing the use of the snow-shoe, or rather the snow-skate. Those that spell like the Norwegians, write the word in point *skide*; those that speak like them, pronounce it *shee*. Men that can run upon the *shee* are far from being numerous. It is not every tree that they grow upon. To be enabled to do so they must have had a long preliminary education, and have begun it early; middle-aged men are slow at learning these matters. The *shee* itself is a long, thin, elastic piece of deal, carved at each end, like a skating-patten under a magnifying glass, or a miniature canoe. About its middle is a double thong to fasten it to the foot with. The forepart projects about three feet, and the hinderpart as much more, covering, endways, six feet of snow, and so not being liable to sink in deep places. Thus supported, you may not only walk over snow-drifts, which, if you wore common shoes, would totally smother you, but you may also run over whole tracts with excessive velocity."—Latham's *Norway and the Norwegians*, 2d vol. page 239.

v.

His bow bent Hemming 'gainst his foot
And shot her in her side;—
"That find'st thou not, I trow, so good,
As suckling thy young in pride."
Hemming the young on snow-skates well could leap!

vi.

Then up thereat that white bear rose,
And clasps him with paws so grey:
"Nor that, I trow, thou'lt find so good
As slumbering by thy may."
Hemming the young on snow-skates well could leap!*

G. Monsters. 15. "The Monster slain." A. T. 415. The Danish copy† is more complete.

16. "A Knight slayeth a Sea Monster‡ that devoured fair Ladies." A. i. 129. The most remarkable stanza in this song is the 5th, which refers to some superstition now no longer understood:—

Swain Färling to the smithy rides,
To fix his hilt fast on:
And then to kirk-yard takes his course,
God's name he'd set thereon.
But fain I'd follow Färling.

III. SPELLS, ENCHANTMENTS, AND WONDERS, &c.

A. Spells. 1. "The Wicked Charm, or the Childbirth delayed." A. ii. 252, 254. These songs, of which there are varieties in Danish,§ are similar in character to "Willie's Lady,"|| and to "Sweet Willie of Liddesdale."¶ But in Swedish *the spell is not unloosed*, and the unfortunate lady gives birth "in the fortieth week of the ninth year," to

A son who standeth up and combeth out his hair;
and to a strapping equal,

A daughter who the rich red silk could sew and
broider fair!

2. "A rich old Man taketh a young Knight's May to be his Bride, but a death sickness is charmed on him by his Rival, who getteth to his Spouse." G. ii. 82. The

*Hemming letar skogh och siuhl,
Och i de tränge ijde,
Finner han på den hytte biörn,
Hans unger läge och didde.
Hemming hin Vnge kunde vahl vppå skjilderna löppa, &c.

† Nyerup, i. 150; *Syv*, 120.

‡ The whole of this class of ballads is beautifully applied by Ariosto and the Italian bards, though their basis was the classical legend of Perseus and Andromeda. Still it would appear that to the Northmen we are indebted for the original form. Shall we arrive at last at the singular conclusion that the northern has originated even the Italian legend?

§ Nyerup, i. 271, 287; and *Syv*, Pt. iv. No. 90.

|| Scott's *Border Minstrelsy*.

¶ Jamieson, ii. 179.

most curious thing in this song (of which there is a Danish copy) is that the lady, who strictly forbids her lover's plain proposal to murder the aged bridegroom, seems to have no misgivings of conscience at the success of his not very roundabout warlock plan!

3. "The Runes of Slumber, or the Maiden victorious." A. ii. 249. This highly curious and Eddaic Ballad relates how a virgin, who could sleep each night with a man, and yet rise up a maid,* at last became so famous that "a kyngys sonne of Engelande" set out to try whether he could not triumph over her charm. The maiden however resorted to an expedient, on which we would not advise the modern fair to depend:—

x.

On the bed she laid the sheets all blue,—
Trim Tramelin!
And wrote there Runes of strength† anew;
Skur lur leja.

The effect was instantaneous, and the Amazon was compelled herself to awaken him on the *third* day.

Lest he should sleep his eyes quite out!
Skur lur leja.

B. Enchantments. 4. "The Enchanted Princess is delivered from being a Nightingale by a bold young Knight." G. ii. 67. *Nyerup's* Danish copy is probably a translation of this. Our want of space is our only reason for not attempting a version; but as it consists of twenty-five times six lines, we can only give one verse, as a specimen of its echo-like construction:—

She shaped me to a Nightingale,
Nightingale—
And bade me fly the world about;
My brother charm'd to a wolf so grim,
Wolf so grim—
And bade him to the forest leap.

5. "The Enchanted Maiden is delivered to a King's Son from being a Linden-tree." G. iii. 114, 118. This charming little ballad would well deserve its place in a romantic continuation of Ovid's *Metamorphoses*.

6. "The Enchanted Maiden, first a Hind and then a Hawk, delivered by her Lover." A. ii. 264. There are several similar ballads in *Nyerup's* and *Syv's* Danish collections. The lover showed he was in earnest in a most uncommonly disinterested manner,

for he cut the "bleeding bait," which was to uncharm the hawk, from his own bare breast! The two last lines are very decisive!

He's not yet born, nor born can be,
Who e'er can part us two!

7. "The Enchanted Maiden slain in the form of a Hind." A. ii. 260, 262. Both copies are very affecting. The former ends thus:

xii.

By the stream the rime-frost falls, I wis:
I' th' woodland!
Who finds good fortune happy is!
Who beareth gold each haunch beneath.

xiii.

The crane swings high into the sky;
I' th' woodland!
Happy who can misfortune fly!
Who beareth gold each haunch beneath.

8. "The Enchanted Knight becomes himself again." A. ii. 267, 269. Needles, knives, and scissors, are among the rather unwonted things into which this luckless wight was enchanted by his step-mother!

9. "The Enchanted Prince is delivered by his Maiden from his Lind-Serpent shape." G. iii. 122, 124; A. ii. 270. These songs, of which there is also a variation in Denmark,* have some points of resemblance with "Kempion."† They belong to a class of Scandinavian superstitions, which we may perhaps explain in some future article.

C. Wonders, &c. 10. "A foreign Noble imprisoneth his young Spouse, who persuadeth the Raven to carry word hereof to her Father. Hereupon he hasteneth to his Daughter's succour, and, aided by his wondrous Horse (Blacken), succeeds in rescuing her." G. ii. 194.

11. "The merits and death of Blacken, the Wonderful Horse." A. ii. 257, 258. These three ballads, and a fourth in Danish,‡ are all the fragments that have hitherto been recovered of the old Scandinavian Saga of the famous Blacken. It appears from tradition, that the same cause, as in the two following ballad groups, namely, the "naming to death," occasioned the good steed's ruin, though not till after he had rescued both his master and the prisoned beauty!

12. "The Knight 'named to death' by the Maid he carries off." G. i. 5; iii. 76, 81.

13. "A Maiden, 'naming to death' her dear Knight, suffers grievously from her kin, relates her sorrows and so dieth." G. ii.

* There appears some analogy between this tale and the Lay of Sir Gawaine in Le Grand's *Fabliaux*.

† The "*ramme runor*" of the original can also be rendered *Raven Runes*.

* *Nyerup*, i. 255; *Syv*, Pt. iv. No. 34.

† Minstrelsy of the Scottish Border.

‡ *Nyerup*, i. 319.

7: A. ii. 170. The songs on this subject, of which there are Danish variations,* are highly interesting to the British student, from their supplying the true key to that beautiful Border Legend "The Douglas Tragedy."† The reader will observe, from the context above, that the 7th stanza in the Scotch poem proves the existence of the extraordinary idea involved in it at an early period in North Britain. Out of the five Swedish ballads relating hereto, we have selected the first, as being on the whole the most perfect and the most in keeping, and offer no apology for adding it entire, as a Scandinavian explanatory Appendix to the Scottish "Douglas Tragedy. We would willingly have added the fine old melody also, but we cannot!

HILLEBRAND.

I.

Hillebrand served in the king's halls so gay—
In the grove there:
For fifteen round years, I wis, he'd serve there night and day;
For her that in his youth he had betrothed there!

II.

Not so much served he for silver and goud;
In, &c.
'Twas that fair Ladie Gulleborg so dearly he loved!
For, &c.

III.

Not so much served he for pay or for place;
'Twas that fair Ladie Gulleborg she smiled with such sweet grace.

IV.

"And hear, Ladie Gulleborg, listen my love!
Hence to lands far off, dear! say wilt thou with me rove?"

V.

"Ah! willing with thee would I haste far away;
Were't not, love, for so many who watch me night and day!

VI.

"For me watches father, and mother also;
For me watches sister, and brother, too, I know.

VII.

"For me watch my friends, and me closely watch my kin;
But most that young knight watcheth me to whom I pledged have bin."

VIII.

"A dress of fine scarlet I'll cut for thee, my dear!
He then can never know thee by thy rosy cheeks clear.

IX.

"And rings will I change on thy fingers so small;
Then never thereby can he know thee at all!"

X.

Hillebrand his palfrey grey saddled right soon,
And lightly Ladie Gulleborg he lifted there a boon.

XI.

Away so they rode o'er thirty miles long wood;
When, see! to meet them cometh a knight so stout and good.

XII.

"And whence, friend, hast thou taken that fair young page with thee;
Full badly in his saddle he sits, as't seems to me."

XIII.

"But yestern I took him from 's mother so kind;
Thereat how many tears, alas! adown her cheeks fast wind!"

XIV.

"Methinks that once more I that rose-cheek should ken,
But his cloak of such fine scarlet I cannot tell again.

XV.

"Farewell, now, farewell! and a thousand times good night!
Salute the Ladie Gulleborg with a thousand times good night!"

XVI.

But when they had ridden so little a while,
The maiden it listeth to rest her awhile.

XVII.

"And Hillebrand, Hillebrand! not now slumber here;
My father's seven trumpets I hear loud-pealing clear.

* *Nyerup*, iii. 353; *Syv*, Pt. iv. No. 32. † *Scott's Border Minstrelsy*.

XVIII.

" My father's grey palfrey again now I know,
'Tis fifteen long years since through the woodland it did go."

XIX.

" And when 'mid the battle I ride against the foe,
Then, dearest Ladie Gulleborg, name not my name to woe.

XX.

" And when 'mid the battle, as hottest it be,
Ah ! dearest Ladie Gulleborg, my horse thou'lt hold for me !"

XXI.

" My mother she taught me to broider silk and gold,"
But never yet I've learned me in battle horse to hold."

XXII.

The first charge he rode, when together they flew,
So slew he her brother and many a man thereto.

XXIII.

The next charge he rode, when together they flew,
So slew he her father and many a knight thereto.

XXIV.

" And Hillebrand, Hillebrand ! still now thy fierce brand ;
That death, ah ! my good father deserved not at thy hand."

XXV.

Scarce had fair Gulleborg these words uttered o'er,
When seven bloody wounds had Sir Hillebrand gashed sore.

XXVI.

" And wilt thou, now, follow to thy tender mother's home,
Or with thy death-sick childe still onward wilt thou roam ?"

XXVII.

" And indeed I will not follow to my tender mother's home,
But sure with my death-sick childe still onward will I roam."

XXVIII.

Through dark woods thus rode they, for many a weary mile ;
And not one single word spoke Hillebrand the while.

XXIX.

" Is Hillebrand awear'd, or sits care on his brow ?
For not one single word he speaketh to me now !"

XXX.

" Nor wearied I am, nor sits care on my brow ;
But fast down from my heart my blood it drippeth now !"

XXXI.

And onward rode Hillebrand to his dearest father's lands ;
And there by the hall to meet him his tender mother stands.

XXXII.

" And hear now, how is't with thee, Hillebrand, sweet knight mine ?
For fast the red blood drippeth from off thy mantle fine."

XXXIII.

" My palfrey he stumbled, and quickly from my seat
I fell, and right hardly an apple-bough did greet.

XXXIV.

" My horse lead, dear brother, to the meadow close by ;
And a bed, my dearest mother, make up where I may lie.

XXXV.

" And curl now so gaily my hair-locks, sister dear !
And haste thee, father dearest, to get my burial bier !"

XXXVI.

" Ah ! Hillebrand, Hillebrand, speak my love not so,
On Thursday right merrily to the wedding we will go !"

XXXVII.

" Down in the grave's house of darkness shall we wed ;
Thy Hillebrand lives no longer, when night's last star is sped."

XXXVIII.

And when as night was sped, and the dawn beamed out to day,
So bare they three corpses from Hillebrand's home away ;

XXXIX.

The one it was Sir Hillebrand, the other his maid, death's bride
In the grove there :
The third it was his mother, of a broken heart she died !
For her that in his youth he had betrothed there.*

* " Hillebrand tjente på Konungens gård,
Uti lunden—
Och der tjente han uti femton runda år
För den han had' trolofvat i sin ungdom," &c. &c.

14. "Love and Life, or the Maid who slew herself on the corpse of her Beloved, when a Bird (Angel) restored them both to life again." A. i. 230, 233. The subject, we believe unique in ballad literature, is evidently of great antiquity. The sanction apparently given by the angel to the Christian sin, though Heathen virtue, of suicide, is a curious instance of the confused christianization of an olden legend. The bard who added the Angel-verse had more zeal than knowledge. The 13th stanza in the first copy is full of artless beauty :

Many thanks, thou bonny little bird,
Many thanks for this too-busy care ;
Thou hast waked us from our good sweet sleep,
On each other's arms soft slumbering there !

15. "The cruel Sister and the wondrous Harp." G. i. 81, iii. 16 ; A. ii. 139. This very beautiful ballad exists, in various forms, throughout Sweden, Scotland,* Ireland,† and the Feroe islands.‡ Want of space forbids our giving even one of the important variations before us.

16. "A Swain inviteth home the King and Court, when suddenly all becomes rich and splendid." G. ii. 176. This subject is also handled in an old popular tale, and is a dim fragment of Oriental origin still remaining among a people of Oriental extraction.

17. "The King and the Fortune-teller." G. ii. 274. This ballad well deserves translation.

18. "Two knights, hunting on the sabbath-day, are bewitched by the Devil, and slay each other." A. ii. 68. This subject, a genuine illustration of the identity of Monk-Gospel, and Sir A. Agnew's Judaic-Christianity, appears to have been known in all Scandinavia.*

IV. DREAM-LEGENDS.

1. "The prophetic Dream, or the Son's Revenge on his father's Murderer." A. ii. 75. The last stanza is very fine :

Palne leaps both moss and mire,
And dikes so deep and wide,
His seven bold brothers follow close
To hew—not gar him bide !
In thorns and flowers.

2. "The dream realized, or the Knight and his Bride are brent." A. ii. 79. The 6th stanza of this ballad also contains some old superstitious observation. We omit the double refrain :

"Dear mother ! greet ye not so fast,
For seven full years those dreams shall last."

3. "The Dream fulfilled, or the Lover that gified the Corpse, and then died for Love thereof." G. iii. 104 ; A. ii. 21. The knight's directions to the grave-diggers, after having given them gold that they may obey him the better, are (in *Arwidsson's* copy) full of melancholy tenderness :

XV.

"And dig the grave ye're digging there both wide enough and deep ;"—
It runs so in my mind, I say !
"For there, within that chamber-vault, our wanderings we shall keep."—
Thou shouldst not sorrow, bad thy May.

XVI.

"And dig the grave ye're digging there both deep and eke full wide ;"—
It runs so in my mind, I say !
"For there, within its narrow bounds, full often shall we glide."—
Thou shouldst not sorrow, bad thy May.

4. "The Wife's Dream, or the treacherous Father-in-Law" (A. i. 10), is exceedingly ancient, and reminds us of many passages in *Inorre Sturleson's* Royal Sagas.

5. "Of the Knight who lost his Sweet-heart by his Brother's treachery, and how he dreamed thereof, and visited the Bride, and slew his Brother with many others, afterward doing grievous Penance in the Woods" A. i. 216, 224, 412. These curious and terrible ballads, of which one

copy has nearly fifty double verses ! are also paralleled in Danish.†

6. "The mournful Dream, or the slaughtered Knight and his dying Spouse." A. i. 211. This well deserves translation, abounding as it does in ballad beauties. But its length, twenty-five double verses, will not allow us that pleasure.

7. "The happy Dream, or the youngest Daughter becomes the greatest Queen." A. ii. 183. This ballad is very naïve and pretty.

V. GHOST-LEGENDS.

1. "The Champion wakes up his Father's

* "The twa Sisters," *Jamieson*, i. 50.

† "The cruel Sister," *Scott's Minstrelsy*.

‡ A valuable copy was transmitted thence by Professor Rask, and is printed, with a translation, in *Geijer's* first volume, p. 86.

* *Nyerup*, iii. 160, 322, and MSS. in the Roy. Lib. Stockholm.

† *Nyerup*, iii, 74.

Ghost, and demands his Battlebrand." A. ii. 445.*

2. "The Knight, betrothed when a Child, invokes his (Father's) (Mother's) Shade to reveal to him his promised Bride." G. i. 57; A. ii. 284. These three ballads remind every Scandinavian student of Odin's descent to Hela in the Edda, the invocation in the Hervara Saga, &c.

3. "The Step-mother rebuked, or the Mother's descent (to) (for) her Children." G. iii. 33, 36; A. ii. 94, 97, 101. Willingly would we give one or two of these fine ballads, of which there are Danish† parallels, in an English dress. Never was the hated step-mother more bitterly satirized? Their contents are curious, and their style and colouring *à la Rembrandt*. "Death comes into the village and taketh" the first good wife. After a time, her poor cruelly-treated bairns gathered together on her grave, and

VIII.

Their salt tears on their cheeks fell fast,
Their mother from heav'n they wept at last:

IX.

They greet salt tears, they greet red blood,
They greet till their mother from black earth stood.‡

X.

To the Angel-Host Dame Sölverlind said;
"Is it lawful for me on earth to tread?"

XI.

"Well may'st thou go and the earth-realm tread;
But haste, before cock-crow, back to thy bed!"§

On revisiting her neglected children, she washeth them in her tears!

4. "The Loyer's Ghost visits his Maiden dear. G. i. 29, ii. 204; A. ii. 203. The subject of these ballads is now familiar in Britain.||

5. "The Ghost cannot rest till the unjustly-gotten Land is restored." A. ii. 106. This antique ballad depends on the old nor-

thern belief, that in case any absent relative should be murdered, the armour, sword or shoes, which he had left at home would be covered or filled with blood.

6. "The murdered man's Ghost." A. ii. 451. A more complete copy is found in Denmark.*

VI. CHAMPION SONGS, OR "THE TWILIGHT OF HISTORY."

1. "Axel Thordson and fair Valborg." G. i. 148. This lay or romance is common to Norway, Denmark, and Sweden. It is of great beauty, highly affecting, and extremely valuable as containing a picture of the manners and prejudices of the middle ages of Scandinavia. It is probably originally Norwegian. Its extreme length (200 verses of four lines) prohibits anything more than the merest skeleton-outline of the story. The high-born and valiant knight Axel Thordson returns from "The Emperor's Palace" to marry his betrothed. But his rival, the young prince, assisted by a jesuitical villain, the Dominican Master Knut, ascertaining that they were within the degrees, forbids the match, and himself, every other *volens volens*, compulsorily betroths the fair one. Shortly after, war breaking out, the young king hastens with his army to the field, and drives back the foe, till at last he receives his death-wound. The brave young knight Axel, ever in the thickest of the fight, and bearing a shield blazoned with two blood-red hearts, revenges his rival's death with the most chivalrous valour, till the victory is his own, and he falls covered with eighteen wounds. The twice-betrothed and never-married beauty, on hearing such sorrowful tidings, retires to a cloister for the rest of her days. We add the three last stanzas:—

CXCVIII.

Within that cloister's walls, we hear,
Both maids and virtuous dames abound;
But none so fair as Valborg dear,—
On earth her like is scarcely found.
But fortune takes full many a turn!

CXCIX.

Better, unborn, this earth ne'er tread—
Than still to live in grief and strife,
With anguish eat one's daily bread,
And never taste the joys of life.
But fortune takes full many a turn!

CC.

I pray God pardon them who part,
So cruellie, so wickedlie,
Fond faith from faith, fond heart from heart,
Which would in honour joined be.
But fortune takes full many a turn?†

* Spiritedly given by M. Lewis in the *Sword of Angantyr*; better still in a ballad which we believe has never seen light, by the late Rev. T. Greenwood, of Trinity College, Cambridge. Lewis has some lines of great power. Hervor on receiving the sword exclaims:

"Flames amid my ringlets play,
Blazing torrents dim my sight;
Fatal weapon hence away,
Woe be to thy blasting might.
"Woe be to the night and time,
When the magic sword was given;
Woe be to the Runic Rhime,
Which reversed the laws of heaven."

"The Descent of Odin" is familiar to the English reader in the glorious lines of Gray.

† Nyerup, i. 205; Syv, Pt. iv. No. 78.

‡ A. ii. 95. We omit the refrains. § G. iii. 34.

|| A translation of the Danish copy, called "Aa-ger and Elsa," is found in the *Foreign Quarterly Review*, No. XI. p. 62, and parallel traditions are preserved in *Percy's Reliques*, iii. 105; "Clerk Sanders," *Jamieson*, i. 83; and *Scott's Minstrelsy*.

* Nyerup, i. 201; Syv, Pt. ii. No. 5.

† "I klostret mängen gifven är,
Både jungfrur och dygdiga q'vinnor;
Dock ingen så skön som Walborg kär
Hvars like man näppeligt finner.
Men lyckan hon vänder sig ofta om," &c. &c.

2 "Habor and Signild." G. i. 137. This exquisite ballad, one of the finest in the whole world, ought long since to have been translated. Its extreme length (62 four-line stanzas) forbids our entering into its beauties. An outline of its incidents may be found in the works quoted below.*

3. "The Champion Hake." A. ii. 425. A fresh and pleasant chanson enough. The hero, in the old style, slays the monsters, and marries the king's fair daughter. The refrain is the best *characteristique* we could give of the whole ballad:

He taught the trolls to dance there!

4. "The Fight of Vidrik Verlandsson with the giant Högben" (Long-Legs!) A. i. 13, 20, 405.

5. "The Twelve strong Champions." A. i. 28, 37, 407.

6. "Wolf of Jern," (Bern.) A. i. 49, 56.

7. "Earl Guncelin." A. i. 67. The Knights of the Round Table and the Paladins of Charlemagne were not more renowned in the south of Europe than *Didrik of Bern*, (Theodoric of Verona, King of the Ostrogoths,) and *Sigurd Jafnersbane*, had become in the north. Song and Saga are full of their exploits, and of the indomitable courage of their champions and comrades. The above ballads belong to this cycle, and are partly paralleled and partly imitated in the *Vilkina Saga*, the old German *Rosengarten*, *Sæmund's Edda*, (Sigurdar Qvida,) and in Danish and Feroe ballads, &c. &c.

8. "Olger (Ogier) the Dane and Burman." A. i. 75, 80. This subject is also known in Denmark, and is extremely common in Sweden. It is perhaps as old as the Chevalier Romance written by Adan, and called *Ogier le Danois*, which was translated into Danish, and published in the sixteenth century, by *Pedersen*.

9. "Essliörn the Courteous and Orm the Strong." A. i. 87, 95.

10. "Wolf the Strong." A. i. 103. The subject of these ballads is the same as that treated of in *Orm Stórólfs son's Saga*,† supposed by Müller‡ to have been written in the fourteenth century. The hero may well be called *the Strong*, for, when only twelve years old, on being reproached by his father, whom he was assisting at hay-making, that he was taller than he was strong—*Orm* laid hold of the load of hay that had been driven

from the plain, and threw it, *horse and all*, high up upon the stack! Even an outline of the adventures of such a knight would take up too much room. We refer our readers to Arwidsson's *Sketch*, Vol. i. pp. 101, 102.

11. "King Speleman." A. 107. In this ballad, an immensely strong *thresher* ("*loge-dräng*") slays with an oak-tree the eleven champions whom King Speleman had combated in vain. Naturally enough, the successful hero calls himself, thereafter, *Ott the Wise*.

12. "Ivar Jonson." A. ii. 410. This old fragment is not without interest.

13. "Duke Henry." A. ii. 422. This romance, in which a grateful lion guides home the Duke in time to recover his spouse, is originally German.*

14. "Sir Arvid." A. ii. 417. This ballad has considerable interest. It relates the cruel treachery of a step-father, and the tradition on which it rests was not deemed unworthy of preservation by the great *Linnæus*.†

15. "Peter Tyrson's Daughters in Vänge." G. iii. 193, 197; A. ii. 413. This song is a terrible tragedy. Three brothers (outlaws) cruelly murder three damsels, who, although they know it not, are their own sisters. They then proceed to sell the dresses and ornaments of their victims; but the first house they come to happening to be the home of the missing maidens, they are discovered to have been their murderers. *Peter Tyrson* herewith slayeth two of the banditti, and is about to put the third to death also, when he learns from him that the three criminals were his own long lost children.

16. "The Cloister forced." G. i. 182; A. ii. 393.

17. "Elizabeth, the Nun of Risberga Cloister." G. iii. 182. These are melancholy memorials of a time when, among both princes and people, might was too often right. They are too long to allow dissection; besides which, the latter is comparatively modern, having been written by Bishop *Nils the Holy*, in 1390.

The limits of our present number will not permit us to continue at greater length this article; but that the lovers of legendary lore may not be disappointed, we promise to complete the remaining six heads under which we have classed Swedish minstrelsy in the ensuing; and we trust the ballads that we shall be then enabled to present will be both perfectly new to the public, and offer

* Strong's *Frithiof*, p. 211; Do. the last Translation, by G. S., Index, p. 270, Art. *Hagbart*.

† *Tháttir Orms Stórólfs sonar* is printed after *Olof Tryggvason's Saga*, in the Skálholt edition, and in *Formanna Sögur*, t. iii.

‡ *Saga Bibliothek*, i. 353.

* "Heinrich der Löwe," in Wolff's *Historische Volkslieder der Deutschen*, 22; and *Erlach*, ii. 290.

† *Journey through Skåne*, 324.

still more favourable specimens of the genius and chivalrous feeling of the Northmen.

Harp of the North! that mouldering long has hung
On the witch elm that shades St. Fillan's spring
And down the fitful breeze thy numbers flung,
Till envious ivy did around thee cling,
Muffling with verdant ringlets every string.
Oh, minstrel harp! still must thine accents sleep
'Mid rustling leaves and fountains murmuring,
Still must thy sweeter sounds their silence keep,
Nor bid a warrior smile, nor teach a maid to weep!

ART. III.—*Eléments de Paléographie, pour servir à l'étude des documents inédits sur l'histoire de France, publiés par ordre du Roi et par les soins du Ministre de l'Instruction publique.* Par M. Natalis de Wailly. 2 tom. 4to. Paris. 1838-9. (Elements of Palæography to illustrate the Study of the unpublished Documents on the History of France, published by order of the King, and under the Superintendence of the Minister of Public Instruction. By M. Natalis de Wailly. 2 vols. 4to. Paris. 1838-9.)

THE recent publications of the French Record Commission, the Historical Society of Paris, the Camden Society of London, and the late English Record Commission, have proved how much valuable historical material yet remains buried in the "musty dust" of our libraries. Not only have doubtful points been cleared up, and dark transactions thoroughly elucidated and investigated, but many early epochs both of English and continental political history have completely changed their features, and actual documents taken the place of the generalities and inaccuracies of the ancient chroniclers. Every effort tending to promote the further prosecution of these praiseworthy researches ought to meet with more encouragement than is in general its lot, and with the utmost pleasure we perceive the completion of the splendid work on Palæography which has recently appeared under the auspices of the French Record Commission, and which has so completely unfolded the means of studying old parchments, that nothing remains to be desired. The magnificent style in which these volumes are prepared, and the really new and valuable matter contained in them, ought to read a lesson to the majority of English antiquaries—men who are for ever puddling among antediluvian pots and kettles, instead of employing themselves in the nobler study of history.

Addison remarks that "one of the great

est geniuses this age has produced, who had been trained up in all the polite studies of antiquity, assured him upon his being obliged to search into several rolls and records, that, notwithstanding such an employment seemed at first very dry and irksome, he at last took an incredible pleasure in it, and preferred it even to the reading of Virgil or Cicero." There is, in fact, something delightful in the very act of unrolling old parchments—something that to be intelligibly described requires to be felt—and it is therefore less to be wondered at that the initiated should sometimes overrate the value of such documents. We imagine this to be the case in the present instance, where a greater degree of importance is given to the subject than it really appears to require. This perhaps can scarcely be considered a cause for complaint, but we certainly must utter our protest against the arrangement of the dictionary of contractions in the first volume: to render it useful, the order of the contractions and their explanations ought to be reversed. Indeed, when we compare the list of contractions given by M. Wailly with that contained in Walther's *Lexicon Diplomaticum*, the former is evidently considerably inferior. Neither do we think that M. Wailly has adopted the best method in the grammatical portions of his dictionary, for surely the initial, as well as the final contractions, ought to be separated from the rest, and made a ground-work for the whole. For instance, such contractions as that for *us* ought to form an elementary grammatical table quite distinct from a dictionary, and so frequently do they occur in middle-age manuscripts, that the knowledge of them is absolutely necessary before the object of many other contractions is clearly understood.

But the most interesting and valuable portion of M. Wailly's work consists in his remarks on the age of manuscripts; and it will not be wholly irrelevant, we conceive, if we give the reader a short analysis of what he says on the subject.

Manuscripts which are written in capitals, or have several of their words joined together without any distinction of situation, belong to the seventh century or earlier; and such as are written in capitals, without any distinction of the words at all, belong to the fifth century, and some of them are much older. Greek manuscripts without accents are as ancient as the seventh century, when accents were commonly used; although the celebrated Alexandrian manuscript of the Bible in the British Museum has its first page accented. Saxon characters were in use in England from the seventh

century to the twelfth, and a few are found in English manuscripts of the thirteenth century; the Saxon character for *th* was however retained until the end of the fifteenth century, and the common contraction *ye* for *the* is merely a corruption of the Saxon *th*. Manuscripts that have several of the diphthongs *æ* divided, belong to the ninth and tenth centuries; except, indeed, in some written about the period of the invention of printing, when the scribes began to imitate the hands of the books which they copied: and these may be easily distinguished, by the freshness of the ink and vellum, and by their defects in imitation: and are generally written in a fine Roman hand, most of them having been executed in Italy. Those manuscripts which use the single *e* instead of the diphthong *æ* may be referred to the thirteenth, fourteenth, or fifteenth century.

Varro informs us that palm leaves were at first used for inscriptions; whence probably the word *folium* began and continued to signify the *leaf* of a book, as well as of a tree or plant. Afterwards, he says, that they wrote on the bark of trees; hence the word *liber*, or *bark*, came to signify also a *book*. He also informs us that the first use of papyrus, or *charta* made of the Nilian reed, was at the period of the conquest of Egypt by Alexander the Great; and that when Ptolemy, in emulation of Eumenes, would suffer no papyrus to be carried out of Egypt, parchment was invented at Pergamus, whence it is called in Latin *pergamena*. But although the Egyptian reed for writing on might at those respective times begin to be more universally known and practised, yet there are instances of its being used earlier for that purpose. The ancient practice of writing or engraving on brass is well known, and many old marble monuments still remain, containing inscriptions. But it is scarcely to be expected that ancient writings to any great extent upon lead, linen, wood, wax, bark, reeds, or palm or mallow leaves, should be now extant, the practice having fallen out of use, and the materials being so perishable. The Egyptian remains furnish evidences that this was the fact, and occasional instances of writings upon bark still remain.

We must not, in pursuing these inquiries, lose sight of the grand object for which this valuable work was compiled—a means for *using* historical materials. How far its publication may have effect in England, remains to be seen, but we certainly may venture to express a hope that its influence may be felt on the worthy writers of the articles in the ponderous volumes published by the Society of Antiquaries under the

title of *Archæologia*, as well as on the managers of the Camden Society. As an example of the former we will take the last published half-volume, and demand of the learned secretaries of the Society of Antiquaries, what new historical fact of real importance is brought to light in the course of its *two hundred and six* quarto pages? And what is the reason of this dearth of value? It is this: the society is governed by a clique of men who are irrevocably settled into antiquarian habits of the past century, and will neither keep pace with the present active world, nor encourage those members of the society who alone are able to save its reputation. And why, it may be asked, is there no reaction? Why do those who know better allow themselves to yield to the weight of rusted authority? And why is not some effort made towards a reformation? The reason is obvious: the Society is composed for the most part of men who neither know nor care anything for the objects of the Society, and cannot be expected to complain of the evils of a management they cannot understand; and those members who have been zealous enough to attempt it, consequently suffer the fate of most reformers until they succeed in raising intellect to their own standard.

We are well aware, as regards the Society of Antiquaries themselves, we are doing no more good than talking to the wind; but we cannot resist the fair field of attack furnished to us through the present medium, to champion forth some doughty knight errant ad outrance. We know also that we are liable to the serious imputation of attempting to injure a valuable institution. No such thing. Those are the real enemies of the Society, who, for their own love of the status quo, would maintain it in its present position. To the secretaries we cannot help applying the words of an excellent old Greek song—

“ Ο κάρκινος ὠδ' ἔφα,
χαλῆ τὸν ὄψιν λαβών.
εὐθεία χρὴ τὸν ἐταῖρον εἶναι
καὶ μὴ σκολιὰ φρονεῖν.”

“ Thus spake the crab unto the snake,
When in his claw he trussed him:
‘ Walk straight like me, you wriggling rake!
I hate that *sideway* custom.’ ”

We disclaim all ill-feeling towards the Society, but we must condemn the way in which it is carried on: the Camden Society, of two years' growth, gives to the world four-fold in proportion to the Society of Antiquaries, and with *less than one-half* the income!

In noticing the progress of the Camden

Society, we ought to premise that its objects are much more general and popular than those of the Society of Antiquaries, and that history does not form an essential subject in every one of its publications. Were not this the case, it might reasonably be said that some of its books are below the proper standard of serious learning; but we find so much to approve, and so little to condemn, that on the latter side we will be altogether silent. As the publications of the society are not in general circulation, we propose giving a very brief abstract of each of them.

1. The first publication was a contemporary narrative of the deposition of Henry VI. in 1471, edited by Mr. Bruce, from a manuscript in the Harleian collection. This history was written by a zealous Yorkist, a servant of Edward IV., who affirms that he "presently saw in effect a great parte of his employtes, and the resydewe knew by true relation of them that were present at every time." The history is curious and minute, although tinged with a large portion of party spirit, and in the main may be safely relied upon. Mr. Bruce has edited it from a copy of the original made by Stowe the Chronicler, for the manuscript is not known to be in existence, although it was for some time in the possession of Fleetwood, Recorder of London in the reign of Elizabeth. In his notes, Mr. Bruce has collected together the principal authorities on the manner of the deaths of Prince Edward and King Henry, and we think that his opinion founded on them is deserving of attention. See the editor's concluding observation at p. 47.

2. A play by John Bale, entitled "Kynge Johan," edited by Mr. Collier. This is printed from a manuscript in the library of His Grace the Duke of Devonshire. The design of the play was to promote and confirm the Reformation, of which, after his conversion, Bale was one of the most strenuous and unscrupulous supporters. This design he executed in a manner until then unknown. He took some of the leading and popular events of the reign of King John,—his disputes with the Pope; the suffering of his kingdom under the interdict; his subsequent submission to Rome, and his imputed death by poison from the hands of a monk of Swinstead Abbey, and applied them to the circumstances of the country in the latter part of the reign of Henry VIII.

3. The next publication of the Camden Society consists of a contemporary alliterative poem on the deposition of King Richard the Second, in *English*, together with the Latin poem of Richard de Maydeston,

on the same subject, edited by Mr. Wright. The first is exceedingly curious as a specimen of composition, and was discovered by Mr. Wright in a manuscript in the Public Library of Cambridge, where it had long remained unknown. The second, a Latin poem of little value, is taken from a manuscript in the Bodleian Library at Oxford.

4. THE PLUMPTON CORRESPONDENCE: a series of letters from the reign of Edward IV. to that of Henry VIII., edited by Mr. Stapleton. This volume is taken from a manuscript placed at the disposal of the Camden Society by Peregrine Edward Townley, Esq. The letters it contains are exceedingly curious and valuable, but throw very little light on the history of the period.

5. Anecdotes and Traditions, illustrative of early English History and Literature; edited by Mr. Thoms. This volume consists of a very interesting collection of anecdotes, derived from three manuscripts in the British Museum, and very ably edited by a gentleman who has greatly distinguished himself in the history of fiction. The portion containing notices of traditions is most intensely interesting, and altogether the work is exceedingly honourable both to the society and editor. Nor must we omit to remark the "Notices of Sir Nicholas Lestranger's Family" prefixed, from the pen of J. G. Nichols, Esq., one of the most distinguished topographers and genealogists of the day: this little memoir adds highly to his reputation, and by the extraordinary power of research displayed at every turn, excites the admiration of the reader.

6. A contemporary Chronicle of the first Thirteen Years of the Reign of King Edward the Fourth, by John Warkworth; edited by Mr. Halliwell. Considered in an historical point of view, this is the most valuable of all the publications of the Camden Society, and it certainly yields to none in depth of research and carefulness of editing. John Warkworth was master of St. Peter's College, Cambridge, in the latter part of the fifteenth century, and this document is now for the first time edited from the original manuscript still preserved in the library of the college. In the introduction, Mr. Halliwell has arranged a great mass of evidence in favour of the murder of Henry the Sixth, and we think that no one can now reasonably entertain a doubt of the fact. The notes are full of most valuable matter; we regret that our limits will not permit us to enter into even a slight notice of any of them: suffice it to say, that they contain new and important facts, chiefly taken from manuscripts in local libraries,

and consequently not easy of general access.

7. The last publication of the Camden Society is a collection of English Political Songs, from the Reign of John to that of Edward the Second, edited and translated by Thomas Wright, Esq., M.A. This is a most singularly interesting volume, whether we regard the light it throws on history, or its extreme curiosity. The editor remarks in his introduction that "few historical documents are more interesting or important than the contemporary songs in which the political partisan satirized his opponents, and stirred up the courage of his friends, or in which the people exulted over victories gained abroad against their enemies, or at home against their oppressors, or lamented over evil counsels and national calamities. Yet, though a few specimens have been published from time to time in collections of miscellaneous poetry, such as those of Percy and Ritson, and have never failed to attract attention, no book specially devoted to ancient political songs has yet appeared." An appendix contains some extracts from the French version of Peter Langtoft's chronicle.

When we turn to the intended publications of the Camden Society, we find very inferior documents creeping in, and it would be well if some of them were sent adrift at once, and not allowed to stain the pages of the Society's circular. For instance, Hayward's "Annals of the first Four Years of the Reign of Elizabeth" cannot be worth publishing. Do they contain new facts? Again, we perceive the narratives of Two Pilgrimages to the Holy Land proposed for publication, one of them undertaken in the year 1458, and the other in the year 1517: we question if either of these can contain anything worth paper and print; but, at all events, itineraries of that late date ought to be very different from the generality of such documents to be worth much. The following selection will, however, show that our censure is not extended to all:—

1. A brief History of the Bishoprick of Somerset, from its foundation to the year 1174. Edited by the Rev. Joseph Hunter, F.S.A.

2. The Egerton Papers; consisting of public and private documents formerly belonging to Sir Thomas Egerton, Baron Ellesmere, and Viscount Brackley; and now preserved among the manuscripts the property of Lord Francis Egerton, President of the Camden Society. Edited by John Payne Collier, Esq., F.S.A.

3. The Chronicle of Josceline de Brake-

lond, Monk of St. Edmondsbury, from A.D. 1157 to 1211. Edited by John Gage Rokewode, Esq., F.R.S., Director S.A.

4. The Doctrine of the Lollards: a manuscript attributed to Wickliffe. Edited by the Rev. James Henthorn Todd, B.D.

5. The Rutland Papers: documents relating to the Coronation of Henry VIII., the regulation of his Household, the Field of the Cloth of Gold, and his Interviews with the Emperor, selected from the MS. collections of His Grace the Duke of Rutland. Edited by William Jerdan, Esq., F.S.A.

6. The Chronicle of Bartholomew de Cotton, a Monk of Norwich, from the earliest period to the year of our Lord 1298. Edited by John Bruce, Esq., F.S.A.

7. The History of the Barons' Wars in the Reign of Henry III., by William de Rishanger. Edited by J. O. Halliwell, Esq., F.R.S.

We are, however, much more confined in our historical views than our continental neighbours. The French have their historical Committee of Sciences, and make it a branch of their Record Commission, but what English ministry would not scorn the idea of undergoing the expense of printing middle-age scientific documents, however valuable they may be in the history of the sciences? It is on this account that even the works of our earliest and greatest genius, ROGER BACON, the Aristotle of the middle-ages, are actually in the course of publication under the direction of the French government! If government is found wanting, is there no patron of science—is there no one ready to come forth in the spirit of an Arundel, and claim the glory of such a work as our own?

We look and hope for better things, but we look and hope in vain so long as a mercantile spirit fetters literature, and measures its effects by mammon. Real learning must necessarily be at a discount when authors rely upon their pens for support, and when the most frivolous nonsense is certain of meeting with the best reward. Where is either honour or emolument waiting for the historian? If he turns to the court, is it there? If he trusts to the public, is it there? No! he must be contented in present life with the probability of a future generation producing a few who will be able to appreciate his labours. Such a prospect is not, we think, very inviting, especially in the present age of utilitarianism.

ART. IV.—*Reise des kaiserlich Russischen Flotten Lieutenants Ferdinand v. Wrangel, längs der Nordküste von Siberien und auf dem Eismeere, in dem Jahren 1820 bis 1824.* (Survey of the North Eastern Coast of Siberia, by order of the Russian Government.) Berlin, 1839.

THE publication of the work now before us has been unaccountably delayed for more than ten years, and appears at length in the form of a translation, while the original Russian manuscript is still allowed idly to repose in the archives of the Admiralty at St. Petersburg. The distinguished author has in the mean time been advancing from the rank of lieutenant to that of admiral; his services, therefore, have been fully estimated by his government, a circumstance that makes the suppression of his attractive narrative the more surprising. The consequence has been, that though to the scientific world the name of von Wrangel has long been advantageously known, through some fragmentary communications made by Professor Parrot, yet the public generally have hitherto remained in perfect ignorance of the meritorious and persevering exertions of the Russian seaman, to complete the geographical survey of the north of Asia. Our maps have long borne the corrections which the labours of our gallant author enabled him to effect; it is right that we should at length learn something of the personal sufferings and privations by which those labours were accompanied. Before proceeding, however, to an examination of Admiral von Wrangel's own expedition, we will place before our readers a brief abstract of the earlier discoveries made in Siberian geography.

The earliest discoverers of the Siberian coast were the Russian fur traders, whom, towards the middle of the 16th century, we find engaged in an active commerce with the population dwelling at the mouths of the Ob and Yennissei rivers. They seldom attempted to sail round the peninsula which divides the Gulf of Ob from the Carian sea, preferring to ascend the rivers of the one great maritime inlet, and after drawing their light vessels over a small intervening tract, to descend again by the streams that pour their waters into the opposite bay. From such navigators none but the most vague accounts could be expected of the regions they visited.

Early in the 17th century, the Russian provincial governors appear to have taken a pride in sending small parties of Cossacks into the unexplored recesses of Siberia, for the purpose of imposing a tribute upon the wandering inhabitants, and annexing addi-

tional territories to the already vast empire of their sovereign. In most instances little or no resistance was offered to these conquering discoverers. Sometimes, however, the roving tribes that tended their herds on the frozen heaths of Northern Asia offered the most determined opposition to those who invited them to surrender their wild independence; sanguinary wars then ensued, attended by the same melancholy result which has ever followed the collision of ill-armed and uncivilized nations with the disciplined troops of European powers. Many warlike tribes, whom their discoverers found in the possession of numerous herds of rein-deer, have all dwindled away to a few wretched fishermen scattered along the banks of the majestic rivers that flow in stately solitude through the icy soil of Northern Asia; while nations, of whom Siberian tradition still relates that "their fire hearths were once as numerous as the stars of heaven," have now been either absorbed by some of the neighbouring tribes, or have wholly vanished from the soil over which their ancestors once held unquestioned sway. Yet there is an evident solicitude on the part of the Russian government to let its yoke weigh as lightly as possible on these northern tribes, whom nature has so scantily endowed with her gifts. The tribute imposed on them is light; they are wholly exempt from the law of recruitment, and every encouragement appears to be given to their commerce; but the benevolent designs of the imperial government are often very ineffectually seconded by its local agents, who, by their arbitrary measures, and yet more frequently by well-meant but injudicious interference, oppose almost insurmountable obstacles to the social improvement of the much-enduring natives. One nation only, the Tshuktshi (*Tsheskoos** is the name by which they are known among themselves,) have maintained their independence to the present day, an advantage for which they are no doubt mainly indebted to the mountainous and inaccessible character of the country they inhabit. The Russians have long since renounced the design of subjecting a people who possess so little to tempt the appetite of conquest, and a friendly inter-

* The Russian nomenclature, like that of the East, is variable and uncertain. No set of globes or maps agree even in terms of as close affinity as these now before our consideration. This uncertainty in the names of places, more particularly, however, in their orthography, arises partly from the custom of travellers of endeavouring to describe the articulation of the natives. The natural consequence is, that an English, a French, and a German traveller will almost always vary in their orthography, when writing of half-civilized nations.

course has now existed for more than a century, the *Tsheskoës* repairing yearly in numerous parties to the fair of Ostrovnoye, to barter their furs and rein-deer skins for the tobacco and iron tools which form the chief articles of exchange.

In proportion as the value of the Siberian fur trade became better known to the Russians, their northern expeditions assumed more of a mercantile and less of a military character. In 1610, a company of merchants and *promyshlenniki* or fur-hunters was formed, for the express purpose of making discoveries with a view to the extension of their trade. This company established itself at Turukhansk, on the Yennissei; but though it is known that they made several attempts to navigate the Arctic Ocean, we have no authentic record of the result of any of their expeditions.

In 1644, a Cossack of the name of Michael Stadukhin extended his excursions to the mouth of the Kolyma river, where he first became acquainted with the warlike *Tsheskoës*, and where he succeeded in forming a settlement which has since assumed the denomination of Nishny Kolymsk. Stadukhin was the first who spread the tale of an extensive arctic continent supposed to exist northward from Siberia, of which fabulous land a fragment continued long to figure upon our maps, till the more careful inquiries of Wrangel demonstrated, that if any such extensive land really exist, its distance from the northern coast of Asia must be too great to allow of its existence ever having really been ascertained.

In 1648, a Cossack of the name of Deshneff sailed from the mouth of the Kolyma, and, as the ocean happened in the summer of that year to be unusually free from ice, he succeeded in reaching the Northern Pacific Ocean. A very brief report of this remarkable voyage, written by Deshneff himself, is preserved in manuscript in the Imperial Library at St. Petersburg. Of Deshneff's little squadron not a single vessel survived the voyage; the last was wrecked in the Bay of Okhotsk, whence the hardy Cossack and his twenty-five surviving companions set off on foot, in search of some region where they might obtain provisions, and whence they might send an account of their misfortunes to their friends on the Kolyma. One entire winter they spent in this Siberian wilderness, subsisting chiefly on the bark of trees. Several of them died of hunger, but the survivors, in the course of the ensuing summer, built some boats with which they went up the river Anadyr, which empties itself into the sea of the same name, almost the extreme point of east longitude

on this coast, for *East Cape* is in west longitude. Here they discovered a tribe whom they induced to pay a *Yassak* or tribute. Deshneff, says the *Siberian Chronicle*, "remained some time with these people, but as they afterwards refused to continue the payment of their *Yassak*, and showed themselves in many other respects exceedingly refractory, *they were all put to death!*" Deshneff made several subsequent attempts to acquire a more satisfactory knowledge of these northern seas. In 1652, he sailed from the Kolyma, in a large boat built expressly for his use, but from this his last voyage neither he nor any of his companions appear ever to have returned.

From this time forward frequent attempts were made, sometimes in summer with boats, and sometimes in winter with sledges, to explore the ocean to the north of the Yana and Kolyma rivers, with a view to the discovery of the mysterious land, of the existence of which the Russians appear to have been fully convinced, and which the *Tsheskoës* and other Siberian tribes described as a populous and fertile country. Wrangel's opinion seems to be, that this supposed northern land was in reality no other than the north-western coast of America, which it is not impossible the *Tsheskoës* may at some time have succeeded in reaching in their reindeer sledges across Behring's Strait.

It was in the year 1734, during the reign of the Empress Anna, that these expeditions were first confided to the care of men capable in some measure of availing themselves of the resources of science. In that year arrangements were made for the survey of the whole line of coast from the White Sea to Behring's Strait, and the plan adopted was well calculated to attain the object in view, namely, to determine whether it would be practicable for ships, sailing eastward from Archangel, to reach the waters of Kamtsatka. The expedition was formed of four separate divisions. Two ships were to sail from Archangel, and survey the coast as far as the mouth of the Ob; the second division, consisting of one vessel, was to sail from the last-named river to the mouth of the Yennissei; the third was to sail from the Lena westward to the Yennissei; the fourth was also to sail from the Lena, but eastward, and was directed, if possible, to make its way through Behring's Strait.

The first division, after many fruitless attempts, renewed year after year, succeeded, in 1738, in reaching the Ob river; but this success may mainly be ascribed to the judicious plan of the commander, Malygin, who, during the winter, sent out parties in

sledges over the standing ice, to survey the northern promontory, which the drift ice prevented him from reaching during the summer.

The second division likewise succeeded, by dint of perseverance, in completing the task assigned to it, Lieutenant Owzyn having reached the Yennissei on the 1st of September, 1738.

The third and fourth divisions were less successful. The arduous task of sailing round the northern extremity of Asia was not fulfilled, and even at the present day our knowledge of its position is extremely vague and unsatisfactory, though we are accustomed to see it delineated on our maps with admirable precision. Lieutenant Laptew assigns to Cape St. Faddei a latitude of $76^{\circ} 47'$, but appears to have remained under the impression that this was not the northernmost point, and the longitude continues to this day undetermined. In his attempt to reach it, Laptew's ship was destroyed by the ice, and the following account of what he and his companions suffered will enable our readers to form some conception of the hardships to which the early discoverers of Siberia were constantly exposed :

"On the 13th of August (1740) the vessel was surrounded and violently pressed upon by large masses of ice. They lost their bowsprit, and what was worse, they sprung a large leak. For three days they pumped incessantly, without being able to reduce the water in the hold ; so, to lighten the ship, they were obliged to throw their guns overboard, and land their stores, &c. on the ice. By this means, the vessel was, for the moment, prevented from sinking, but the situation of the mariners was not the less dreadful. They were at a distance from the coast, surrounded by immense masses of ice, among which they were driven about by the current and the wind, with the momentary anticipation of seeing their already damaged vessel completely destroyed. In this fearful condition they remained six entire days, their destruction appearing all the time certain.

"On the 19th the weather became calm, and a severe frost set in, which covered the open places with a thin crust of ice. A few of the most daring offered to start on foot in search of the coast, which, it was calculated, must lie about twenty versts to the South. They set off on their dangerous journey, met a number of open places, which they found means to pass, ferrying themselves over on loose pieces of ice, and after much suffering and peril they reached the coast in safety. In the mean time the frost had become more and more intense, and, after an interval of three days, the sea was completely covered with ice. Laptew and his companions hastened to avail themselves of this circumstance. They loaded themselves with as large a stock of provisions as they could carry, and set off for the coast, which they happily reached ; but after their first congratulations at this their escape, they discovered that their present situation also was none of the most gratifying, since many large streams, down which the ice was still floating in great quantities, made it impossible for them to reach their winter station on the Khotanga. They

saw themselves constrained, for the present, to remain in this desolate wilderness, where they were unable to find any description of wood for firing ; this they felt the greater want of, as the frost was becoming more and more intense, and they were wholly without shelter of any kind. To protect themselves in some measure against the cold, they dug holes in the frozen ground, into which they crept, taking turns with each other for the undermost place. A party was daily sent to the ship, to bring on shore as much as possible of the remaining provisions ; this, however, lasted only till the 30th of August, on which day a violent storm arose, that broke up the ice, and carried the ship with all its contents out to sea. The unfortunate crew were thus deprived of the greater portion of the supplies on which their last hopes rested, and remained on the inhospitable shore, wholly destitute of what, under such circumstances, is usually deemed indispensable, exposed to hunger and cold, to which many of them soon fell victims. The survivors did not, however, yield to despair ; they bore their sufferings with admirable firmness and patience, and continued obedient to their commander.

"Thus passed away a terrible month. At length, on the 21st of September, the streams were sufficiently frozen over to allow Laptew and his companions to depart in search of their last year's winter residence. The difficulties and hardships which they had to encounter on the way were innumerable. A part of their scanty stores were laden on small sledges drawn by half-famished dogs ; the remainder was carried by the exhausted mariners themselves. Thus for five-and-twenty days they wandered through unknown wilds, in which it was only by unremitting labour that they were able to force their way through ice and snow. During this part of the journey, twelve more of the crew died of cold and exhaustion. At length, completely worn out, they reached their winter residence on the Khotanga, where for the first time, since nearly three months, they were able to repose themselves in a warm hut, where for the first time also they were again enabled to enjoy warm food, or indeed any food prepared by the aid of fire. Here Laptew resolved to remain till the return of spring, and then, as soon as the weather permitted, to return with the rest of his crew to the mouth of the Yennissei, where, in the magazines there established, he hoped to find a fresh supply of provisions, of which he stood greatly in need."

What Laptew was unable to effect by sea, he found means to do with the aid of sledges, and partly by himself, partly by the officers under his command, it was distinctly ascertained that between the mouth of the Lena and that of the Yennissei there was no point at which the northern coast of Asia was connected with any arctic continent.

It remains for us to speak of the fourth division of this gigantic Polar expedition. It sailed in August, 1735, but during the first year the vessel was not able to get more than 120 versts to the west, where the commander, Lieutenant Lassinius, determined to winter, but where his men were attacked with scurvy, which raged with such violence that the lieutenant himself and forty-three of his crew fell victims to the malady, and of the nine survivors several died before they

could reach Yakoutsk. In the following year a fresh crew was provided and placed under the command of Demetrius Laptew, who continued year after year his fruitless endeavours to reach Behring's Strait by sea, till in 1741 he finally renounced the attempt as impracticable.

It is to this vast expedition that we are indebted for our imperfect knowledge of the geography of northern Asia. Science, in those days, had not yet placed within the navigator's reach the many invaluable aids which are now at the seaman's command. The charts drawn up by the officers of the *Empress Anna*, therefore, are not to be relied on. The latitude even which they have assigned to the several points of that part of the coast visited and surveyed by the author of the work now before us, has seldom been found correct by later visitors; but the longitude almost always, and in most instances the latitude also, were determined only by the ship's reckoning, upon which it is evident very little dependence is to be placed.

The ill success that attended the endeavours of Demetrius Laptew to sail round the north-eastern coast of Asia seems to have stimulated rather than to have discouraged new adventurers. To this, a circumstance contributed which operated a complete revolution in the commerce of northern Siberia. Immense quantities of mammoth's bones had been discovered in the naked heaths situated between the rivers Khotanga and Anadyr, and had become to their fortunate discoverers a most valuable article of trade. The desire of gain induced many of the Siberian merchants to seek with unremitting eagerness for fresh deposits of antediluvian bones, and to these interested researches we are indebted for no inconsiderable portion of our present geographical knowledge of northern Asia. The most fortunate of these enterprising travellers appears to have been a merchant of the name of Laechow, to whom we owe the discovery of the large islands to the north of the Yana and Indigirka rivers. In these islands, there appears to have been found an almost inexhaustible stock of mammoth's bones, of which their discoverer was careful to secure to himself the exclusive *exploitation* by an imperial patent.

In August, 1778, our own countryman Cook appeared in Behring's Strait. He surveyed as large a portion of the Tshuktschen or Tshesko coast as the opposing masses of ice allowed him to approach. He was the first navigator in the Siberian waters that ever attempted, on scientific principles, to determine the longitude of the most important points along the coast, and M. von Wrangel does his illustrious predecessor the

justice to confirm the correctness of his observations. Cook contributed not a little to strengthen the popular belief in the existence of an arctic continent of large extent. He assigned various grounds for the belief: the very trifling increase in the depth of the sea, as he receded from the coast; the swarms of wild geese and ducks that came every year from the north, towards the month of August; the peculiar conformation of the icebergs, &c. The appearance of birds of passage, however, arriving from the north, towards the end of winter, a circumstance on which Cook placed his principal reliance, as demonstrating the existence of a large northern land, is one that has since been satisfactorily explained. The wild geese subsist chiefly on fish, to which they are debarred access by the freezing of the rivers, and in search of which they are obliged to fly towards the open water, which is found farther towards the north, where it has now been ascertained that, even in the severest winter, when the thermometer of Reaumur stands at 45 degrees under the freezing point, the Arctic Ocean continues free from ice. In proportion as the ice breaks up the birds are obliged to fly towards the shore, where they usually arrive just before their moulting season, and whence they return towards the north as soon as the winter sets in again.

The achievements of Cook excited the emulation of the Russian government, and in 1787 Captain Billings sailed, with two vessels, from the Kolyma, with the view, among others, of ascertaining the practicability of going by sea eastward to Behring's Strait. Like all his predecessors, Billings was prevented by the ice from proceeding more than about a hundred miles along the coast. He felt the hopelessness of attempting to navigate this part of the ocean, and consulted with his officers, whether it might not be more advisable to choose the winter for the period of their researches, when they might proceed over the ice a considerable distance to the north, in sledges drawn by dogs. This plan, however, was soon abandoned, under an idea that it would be impossible to carry with them a sufficient stock of food for the large number of dogs that would be required. Billings then left his ships in the Kolyma, and went over land to Okhotsk, where a vessel was fitted out for his use, in which he renewed his attempt in the ensuing summer, but in which he was unable to proceed further than Cook had done before him.

No scientific expedition of any kind was undertaken in this part of the Arctic Ocean after that of Billings till the year 1809, but several discoveries were in the mean time made by the enterprising fur-hunters, and by

the seekers after mammoth's bones. In the year just named, the Russian Chancellor of State, Romanzow, commissioned a public officer of the name of Hedenström to complete the survey of the newly discovered Laechow, or Liaghoff Islands, and while engaged in this task, the enterprising Russian made the important discovery, that the crust of ice by which the Arctic Ocean was supposed to be covered, extended only to a short distance northward. Hedenström, while engaged in the survey, sent one of his assistants, the Cossack Tatarinow, from Cape Kammenoy, the eastern extremity of New Siberia, to try how far he would be able to proceed to the north. Before he had gone more than twenty-five versts he came to open waters, nor could he discover any signs of loose ice on the ocean that lay stretched before his eyes. We shall see, hereafter, that a similar phenomenon baffled all the attempts of Wrangel to proceed due north to any considerable distance over the ice.

Hedenström was recalled from the Laechow Islands in 1811, when the further survey was committed to one of his assistants, M. Pschenezyn, who made the dangerous experiment of spending the summer on these arctic islands, a period of the year when the breaking up of the ice renders it impossible to send any supplies from Siberia. He suffered the severest privations during the *mild* season; nevertheless, he and his companions made some interesting discoveries in the interior of the islands. They discovered large herds of wild reindeer, and evident signs that at no distant period these islands must have been either the fixed residence or the frequent resort of numerous tribes of men.

On the mammoth's bones, which may not inaptly be called the peculiar produce of Siberia and the northern islands, some interesting particulars are found in Hedenström's journal. He observed that the further he proceeded towards the north, the smaller in size, but the more abundant in quantity, became these relics of a former world. In the Laechow Islands it is a rare circumstance to discover a mammoth's tusk weighing more than three pood,* whereas in the interior of Siberia it is not an uncommon thing to meet with one of four times that weight. On the other hand, the immense quantities of these bones found in the Siberian islands form one of the most remarkable phenomena connected with these singular remains. In the words of Sannikow, one of Hedenström's companions, "the first of the Laechow Islands is little more than one mass of mammoth's bones," and though for upwards of eighty

years the Siberian traders have been bringing over annually large cargoes of them, there appears as yet to be no sensible diminution in the apparently inexhaustible store. The teeth found in these islands are also much whiter and more fresh than those of the continent. The most valuable were met with on a low sandbank on the western coast; and there, when after a long prevalence of easterly winds the sea recedes, a fresh supply of mammoth's bones is always found. Hedenström infers from this that large quantities of these bones must exist at the bottom of the ocean.

Such is a brief abstract of the various attempts made at different times to extend the geographical knowledge of Siberia previously to the expedition which forms the more immediate object of our present attention. "With the exception of those of Cook and Billings," says von Wrangel, "none of these several expeditions can be said to have afforded satisfactory results in a scientific point of view. Their authors differ frequently more than $1\frac{1}{2}$ degree from one another in the latitude assigned to the most important points on the coast. Thus the latitude of Cape Swätoi Noss is $70^{\circ} 53'$ according to Sarytschew; $71^{\circ} 50'$, according to Hedenström; and $72^{\circ} 50'$, according to Laptew. Moreover, the whole coast from Cape Schelagaskoi to the North Cape remained completely unknown, and the account of Deshneff's navigation from the Kolyma to Behring's Strait was so vague and obscure, that the English hydrographer Burney considered it to strengthen his well-known hypothesis of the existence of a northern peninsula connecting the continents of Asia and America. Lastly, an assertion of Sennikow, that he had seen land to the north of the Islands of Kotelnoi and New Siberia, had found many adherents; so that the geography of this part of the Russian empire continued in a state of complete uncertainty, while the remarkable researches of Ross, Parry, and Franklin, had led to the most exact survey and description of the northern coast of the new continent. To remove so important a blank in the geography of our country, the Emperor Alexander I. ordered two expeditions to be fitted out, under the command of naval officers, with a view to an exact survey of the North Eastern Coast of Siberia, from the mouth of the Yana to the Schelagaskoi Noss, and also with a view to a more close examination of the islands situated in the Arctic Ocean."

One of these expeditions was placed under the command of Lieutenant Anjou, to whom we are indebted for a survey of the coast from the Lena to the Indigirka, and for a complete map of the Laechow Islands, but whose personal narrative has not yet, we be-

* The Russian *pood* is equal to 40 pounds Russian, or 36 pounds English.

lieve, ever been made public ; the second expedition was that directed by Lieutenant von Wrangel, whose task it was to complete the survey of the North Eastern Coast of Siberia, and to determine, if possible, the long pending enigma, of the existence of a large polar continent. Of this second expedition the reading world is now for the first time favoured with a detailed account.

Experience had sufficiently shown that, owing to the immense quantities of drift ice, no important results are to be hoped for from any attempt to navigate the polar seas during the summer, unless conducted upon an entirely new principle. The only practicable plan appeared to be, to select the winter for the period of their operations, when a thick and solid crust of ice was supposed to cover the ocean, over which it might be possible to proceed, in sledges drawn by dogs, to an almost indefinite distance. On the 23d of March, 1820, therefore, Messrs. Anjou and von Wrangel left St. Petersburg; and on the 2d of November our author arrived at Nishney Kolymsk, which for three years was destined to form the centre of his operations.

In a brief chapter, of twenty pages, M. von Wrangel describes his hasty journey from the one extreme to the other of his sovereign's vast dominions. To an observant eye, however, many interesting facts will present themselves, even where time has been measured out in the most niggardly fashion. Some of his suggestions for the social improvement of these northern regions are admirable, and will meet, we trust, with that attention from the Russian government, to which they are so justly entitled. Nature has endowed Siberia with an invaluable advantage, in the many splendid rivers which flow from Central Asia to the Frozen Ocean, nearly all which are navigable throughout the greater part of their extent. By means of these rivers it is that the northern districts are supplied with many of those articles which there are deemed luxuries, but which in Europe are counted among the most indispensable necessities of life. It is seldom, however, more than eight or nine weeks that the navigation continues completely open, and when the ice remains unusually late, or returns unusually early, the inhabitants of the bleak heaths washed by the Frozen Ocean must subsist, for nearly two years, almost exclusively on the fish caught during their brief interval from frost, or on the meat of such animals (chiefly reindeer and wild geese) as they have been able to kill in their summer months. The establishment of a single steamer on each river, in M. von Wrangel's opinion, would ensure a regular and constant supply to these unhappy tenants of an ever-frozen land.

The establishment of one steamer on the Lena " would give new life to the whole line of navigation, 4000 versts in extent, from Irkutsk to the waters of the ocean ; industry would be developed in these regions ; the inhabitants would receive the necessities of life with more regularity, and at an infinitely lower price ; and the brief Siberian summer would be lengthened by being judiciously taken advantage of. The inexhaustible forest on the shores of the upper Lena would afford an ample supply of cheap fuel, and to the inhabitants a new species of occupation."

At Yakoutsck we are already made acquainted in some degree with the rude character of northern Siberia :—

" The town is situated on a naked plain on the left shore of the Lena. In the spacious streets are seen only mean houses or huts, surrounded by high wooden palings, but in vain the eye wanders amid the gloomy assemblage of boards and beams in search of a tree or even of a stunted bush. Nothing announces the presence of the short summer, unless it be the absence of snow, which, with its dazzling whiteness, would do something to interrupt the sombre grey uniformity of the scene."

Yakoutsck, however, is an improving place, and luxury, we are assured, is making rapid strides among its inhabitants. The general adoption of glazed windows is given as an instance, though even here these must in severe weather be removed, and large plates of ice substituted for them, no glass being able to resist the intense frost of a Siberian winter. Snow moistened with water supplies, in such cases, the place of putty, and closes the windows more completely against the admission of air, than all our southern appliances of listing or double sashes. The moral improvement of the population appears, however, scarcely to keep pace with the progress of luxury :—

" Very little attention is paid to education. Children are usually, immediately after their birth, consigned to the care of a Yakoot nurse, who feeds them up as well as she can, and after two or three years generally returns them, tolerably *Yakootised* to the parents. As they grow up they learn a little reading and writing from the priest or his assistant, and are then initiated into the mysteries of the Siberian fur-trade, or obtain small appointments about the government offices, in the hope of one day attaining a *rank*, a thing here likewise eagerly sought after. This system of education accounts for a phenomenon that at first surprised me, namely, that even in the better circles the Yakoot language prevails almost to as great an extent as French does in our two principal cities. This struck me particularly at a splendid entertainment given by one of the wealthiest fur-traders in honour of the patron saint of his wife. Although the company consisted of the governor, the principal clergy and public officers, and of a few merchants, the greater part of the conversation was so interlarded with Yakootish fragments that I was scarcely able to take any share in it."

At Yakoutsch Messrs. Anjou and von Wrangel parted, the former descending the Lena by water, while the latter proceeded over land to Nishney Kolymsk. Traveling in sledges or carriages ceases at Yakoutsch. Beyond it no beaten road is to be found in Siberia. Our author, therefore, had to proceed on horseback over the mountainous part of his journey, till he reached the northern plains, where sledges drawn by dogs form the usual winter conveyance. His first camping out, on the night after his departure from Yakoutsch, appears to have given him a lively foreboding of the kind of service for which he was preparing. The thermometer, when he arose to make his morning's toilet, stood at two degrees below the freezing point ($4\frac{1}{2}^{\circ}$ according to Fahrenheit).

"It was literally with a shudder that I thought of the Siberian winter before me, when only a few degrees of frost are currently denominated *warm weather*, and it seemed to me inconceivable how I should be able to endure such a long continuance of intense cold. But man is a creature of all climates and all zones; necessity, resolution, and habit, soon enable him to overcome the severest corporal sufferings and inconveniences. A few weeks later, it seemed to me, as to the inhabitants of Kolymsk, that 10° of cold (22° below the freezing point of Fahrenheit) was quite a mild temperature."

In the valley of Miörö we are introduced to a Yakoot who passes for a Cræsus in that part of the world. His lands and herds are valued at upwards of half a million of rubles, yet he retains almost all the habits of his race. One of the distinguishing characteristics of this pastoral nation, as of the Hindoos, appears to be an extravagant fondness for litigation, to gratify which they will often undertake fatiguing and costly journeys, when the matter in dispute does not perhaps exceed half a ruble. M. von Wrangel hints that the Russian functionaries are not slow in encouraging a propensity from which they derive a material part of their income.

An English groom would find some difficulty in picturing to himself the habits of the Yakoot horses:—

"They will often," says M. von Wrangel, "make the most fatiguing journeys of more than three months' duration, and though during the whole of this time they receive no nourishment but the shrunk and half decayed grass, which they are obliged to scrape with their hoofs from under the snow and ice, nevertheless they continue strong and in good condition, and manifest the most astonishing powers of endurance. It is remarkable, also, that the Yakoot horses preserve their teeth uninjured to a very advanced age, whereas those of European horses are worn away as they grow old. This may possibly be occasioned by the hard corn on which ours are fed, while those of Siberia never receive oats, nor indeed any thing but

the soft grass. The Siberian horses also continue young much longer than ours do; one of them will do good service to his master for thirty years."

Anxious as we are to bring our author to Nishney Kolymsk, the point at which his scientific labours properly commenced, we cannot refuse ourselves the pleasure of pausing for a moment, to make our readers acquainted with Father Michael, the Russian priest of Saschiversk,* a small town on the banks of the Indigirka; so small indeed that it consists only of a church and four or five huts, the whole population being composed of the priest, his brother, a Yakoot postmaster, and two Russian families.

Consigned as Father Michael was to what must have appeared so insignificant a station, he has found means, by the zealous discharge of his pastoral duties, to make his name known and respected throughout a large portion of his sovereign's dominions. Father Michael, when M. von Wrangel visited him, in 1820, was eighty-seven years of age, sixty of which had been passed in his humble living. During this period he had not merely baptized, but had really initiated into the first principles of the Christian religion, more than 15,000 Yakoots, Tungusians, and Yukaheers; and by his preaching and friendly counsel, and more perhaps by his example, he had found means to operate an evident improvement in their moral and social condition. Age had in no way cooled the zeal of this Siberian apostle, who, regardless alike of peril and of the rigours of the climate, was still in the habit of travelling 2000 versts† every year to baptize the new-born children of his widely scattered flock, to whom he not only afforded spiritual consolation and temporal advice, but was ready, on an emergency, to assume the office of physician, a character to which he may have been indebted for no small part of his influence over his rude parishioners. Father Michael, however, was not wholly absorbed by his clerical duties. Old as he was, he still went a fur-hunting to the neighbouring mountains, and relied upon his rifle for no small addition to his little income; and he had succeeded in planting a little kitchen garden, in which he reared potatoes, turnips, cabbages, and other European vegetables, exotics usually known only by name in these remote northern regions. Among other dainties, the old man placed before his guest

* Siberian geographers may, however faulty in nomenclature, claim the praise of great accuracy in detail. This village of five huts figures away on our globes under *Zateversk* and numerous other designations.

† The Russian verst is equal to about two-thirds of an English mile.

a cake made of fish-flour, an article of his own invention. The fish, having been completely dried, is rubbed into a fine powder, and, if kept from damp, may be preserved for a long time. Mr. von Wrangel assures us, that, with the addition of a little wheaten flour, very savoury pastry may be made of it.

The cold became more severe as our author advanced further towards the north, and before reaching Sredne-Kolymsk, though yet in the middle of October, the thermometer had already marked 29° below zero. He thought it high time, therefore, to make his winter toilette, the particulars of which may be interesting to those of our readers who are desirous of studying foreign fashions.

* "Over my customary travelling uniform I had first to pull a *camisole* with sleeves and breast-piece, both lined with the fur of the silver fox. Over my feet I drew double socks of soft young reindeer skin: and, over these, high boots or *torbassy* of similar material. When riding, I put on, in addition, my *nakoléniki* or knee-pieces. Lastly came the *Kukhlánka*, or over-all, a sort of wide sack with sleeves, made of double reindeer skin, with fur inside and out, and a hood of fur hanging down the back. There were also a number of small pieces to protect the face; the *nanossnik* for the nose, the *naborodnik* for the chin, the *naushniki* for the ears, the *nalobnik* for the forehead, &c.: and to complete my costume came an immense fox-skin cap with long ears. I was so embarrassed by this cumbersome, and to me unaccustomed dress, that it was only with the assistance of my attendant I was able to mount my horse. Fortunately, the skin of the reindeer is exceedingly light, considering its warmth and closeness; otherwise it would be impossible to bear the weight of so many pieces of fur.

Nishney-Kolymsk is a wretched fishing village, consisting of a church and forty-two houses or huts, into which the inmates creep for shelter during their nine-months' winter, but which are left to take care of themselves during what are called the summer months, when the whole population wander away to catch fish and reindeer, of which the meat when frozen is laid by as a stock for the winter. Completely exposed to the piercing winds that come sweeping from the north pole, the climate of the place is even more severe than its latitude would imply. On the 2d of November, when M. von Wrangel arrived, the thermometer stood at 32° (36° below zero of Fahrenheit); and though in summer the temperature sometimes rises to 18° (70° of Fahrenheit), yet the average for the year is not above 8° below the freezing point of Réaumur. During the first week in September the Kolyma is usually frozen over, and in January the cold reaches 43° (59° below Fahrenheit's zero), when the very act of breathing becomes painful, and the snow itself throws off a vapour! This intense cold is usually accompanied by

a thick mist, a clear day being of rare occurrence during the whole winter. For eight-and-thirty days the sun never rises, and for fifty-two it never sets. The summer itself brings little enjoyment with it, for in the early part of July the gnats or mosquitoes appear in such countless swarms, that they fairly darken the atmosphere, when large fires are lighted of dried moss or leaves, under the smoke of which not only the inhabitants but even the cattle seek shelter from the persecution of their diminutive tormentors. These insects, however, perform one most important office for the good people of Nishney-Kolymsk, by driving the wild reindeer from the forest to the open heath or *tundra*. The herds wander by thousands during the gnat season towards the sea-coast, when, more particularly while crossing the rivers, large numbers of them are easily killed by the hunters.

Vegetation is almost extinct in this northern region. A few berries are in favourable seasons collected by the women; but with this exception no plant grows that can be used for food. The soil never thaws; and of the few stunted trees that still linger about the Lower Kolyma, the roots seldom strike into the ground, but lie for the most part stretched along the surface, as though they shrunk from the thick strata of ice below. A few wild flowers adorn the heaths in summer; the rose and the forget-me-not then invite the sentimental lover to expatiate on their beauty, if love and sentiment can indeed exist where all Nature is covered with an almost perpetual shroud,—a north wind, even in summer, scarcely ever failing to bring with it a snow-storm.

The district of Kolymsk is calculated to contain 2498 male inhabitants, including 325 Russians and Cossacks. Of this population, 2173 are subjected to the *yassak* or direct tax; which produces 803 fox-skins, 28 sables, and 10,847 rubles in money. The Russians are mostly the descendants of real or supposed criminals; the Cossacks claim the original conquerors of Siberia as their ancestors, form a distinct corporation, and are exempt from the *yassak*. Our author speaks much of the social virtues of these simple-minded denizens of the North, who, during their long and dreary winter, find means to relieve the tedium and monotony of their existence by song, dance, and various other unpretending in-door amusements.

The dwellings of the Russians along the Lower Kolyma vary but little from those of the Yakoots and other Siberian aborigines. The trees in this part of the country being too stunted to afford any material for build-

ing, the inhabitants depend for their supply of timber wholly upon the drift wood brought down the river by the annual inundations which seldom fail to accompany the breaking up of the ice. As soon as a sufficient number of trees has been collected, a kind of log hut is constructed, the interstices of which are filled up with moss and clay, and for the sake of warmth, a mound of earth is raised all round to a level with the window. These huts measure usually from two to three fathoms square, and one and a half fathom in height. In one corner stands the *tshuval*, or fire-hearth, the smoke of which escapes by a small hole in the roof; but, in a few houses, luxury has extended already to the adoption of regular Russian stoves with chimneys. Low and incomplete partitions divide the sleeping-places of the several members of the family, and the rest of the dwelling is made to serve all the multifarious offices of kitchen, workshop, sitting and reception room, broad benches being placed around, on which reindeer skins are spread as a ready couch for an occasional guest. Such a hut is usually provided with two small windows of ten or twelve inches square, through which, if glazed, a scanty light would find its way, but as a substitute for glass fish-bladders are used in summer, and in winter plates of ice, seldom less than six inches in thickness, through which only a very feeble portion of daylight is able to pierce. A small store-house usually stands by the side of the dwelling, and the roofs of both are fitted up with a scaffolding for the drying of fish.

Little value appears to be set on cleanliness of any kind. Public baths are maintained by the order of government, though rarely visited by the inhabitants. Linen or calico is worn only by the more wealthy, and among them the use of it is mostly confined to the women. A shirt of soft reindeer skin with the fur inside, is generally worn next the skin. The outer side of this garment is dyed with a red colour obtained from a decoction of alder bark, and round the edges and the sleeves it is ornamented with narrow stripes of beaver and other skin, which are obtained at high prices from the Tshuktshi. The trousers, likewise of reindeer skin, descend half-way down the leg, and over the whole comes the *kamleyá* of thick tanned reindeer skin, without the fur. The *kamleyá* soon receives a dark yellow tint, from the smoky atmosphere by which the wearer is almost always surrounded. The above constitutes the home costume; but when the Kolymskite dandy ventures abroad he takes care to array himself in various other descriptions of fur, of

which some conception may be formed from the account, given a few pages back, of M. von Wrangel's travelling accoutrements.

Except on state occasions, the dress of the women differs but little from that of the men, unless in the arrangement of the head gear.

"To form a just conception of life on the banks of the Kolyma," says M. von Wrangel, "one must have spent some time with the inhabitants. One must have seen them in their winter dwellings and in their summer *balagans*; one must have shot down their rapid streams in the light canoe, must have climbed mountains and rocks with them, or dashed in their light dog-drawn sledges through the most piercing cold over the boundless tundra; one must in short have become one of themselves. Such was our life during the three years we spent here. We lived with them, dressed like them, fed on their dried fish, and shared with them the hardships and privations inseparable from the climate, and the frequent want even of food which it brings along with it.

"Let us begin with the spring. The fishery forms their most important pursuit; indeed the very existence of the whole population depends upon it. The locality of Nishney-Kolymsk, however, is unfavourable, and the inhabitants are obliged to migrate at this season to more suitable parts of the river. As soon as the winter ceases, they accordingly abandon their dwellings in search of some convenient spot, where they forthwith construct a *balagan*, or light summer hut, and immediately commence their hostilities upon the piscatory tribe. Most of the Nishney-Kolymskites have regular country-houses of this description at the mouths of the several creeks and rivulets, which they begin to visit in April, in order to prepare for the campaign. In the middle of May, when the merchants arrive from the fair of Ostrownoye, on their return to Yakoutsch, the whole population abandons the little place, leaving the whole town to the guardianship of one Cossack sentinel, and perhaps one or two old women, whom age prevents from joining in the general pursuit.

"Spring is the most trying season of the whole year. The store collected during the summer and autumn has usually been consumed for some time; the fish do not always make their appearance immediately, and the dogs, exhausted by their winter work, and yet more by the severe fast to which they have for some time been subjected, are too feeble to allow their masters to avail themselves of the *nast*,* to catch a few elks and wild reindeer. Famine then appears in its most horrible form. Crowds of Tungusians and Yukaheers come flocking into the Russian villages in search of some subsistence. Pale and ghost-like, they stagger about, and greedily devour every species of garbage that falls in their way. Bones, skins, thongs of leather, everything in short that the stomach will receive, is eagerly converted into food. But small is the

* When the warmth of the spring sun thaws the surface of the snow, it freezes again during the night, whereby a thin crust of ice is formed, strong enough to bear a sledge with its team of dogs. In this condition the snow is called *nast*, over which the elks and reindeer are pursued during the night, and as, owing to their greater weight, they are constantly breaking through the ice, they are caught by the hunters with little trouble.

relief they find; for the unthrifty townspeople are by this time almost as ill off themselves, and living upon the scanty remnant of fodder stored up for the use of the dogs, so that many of these faithful and valuable animals perish nearly every year of hunger. There is a storehouse established by the government, where rye-flour is sold to every comer; but the expense of conveying it from so enormous a distance enhances the price to such a degree that few are able to avail themselves of the facility thus afforded them. Although the additional accommodation is granted them of not paying before autumn, still there are not many who can afford to give twenty rubles for a pood of flour which moreover has often been damaged during the protracted journey it has had to perform. Three of these periods of horror did I witness, during three succeeding springs, and even now I shudder when I reflect on the scenes of suffering which I beheld, and of which it would be utterly impossible for me to attempt a description.

It is just when famine is at its worst that relief arrives. Suddenly countless swarms of birds make their appearance. Swans, geese, ducks and several descriptions of snipes. These are the first heralds of spring, and at their coming hunger and want are at an end. Old and young, men and women, all that can walk or run, now rush out with guns, bows, and sticks, to kill as many as they may. In June the ice breaks up, a profusion of fish comes crowding into the river, and all hands are in movement to avail themselves of the short season of grace to provide a store for the coming year. But here a new misfortune often assails them. The stream is not strong enough to float away with sufficient rapidity the mighty mass of ice. These accumulate in the narrows and shoals, and the water, arrested in its course, quickly overflows the whole of the low country, and, if the inhabitants are not quick enough in driving their horses to the hills, the poor animals are infallibly lost. In the summer of 1822 we had such an inundation at Nishney-Kolymsk, which came upon us so suddenly that we had only just time to take refuge with a few of our most indispensable articles upon the flat roofs of our huts, where we were forced to remain for upwards of a week. The water rushed with fearful rapidity between the houses, and the whole place looked like a little archipelago of house-tops, among which the inhabitants were merrily rowing about in their canoes, paying one another friendly visits and catching fish.

More or less these inundations occur every year, and when the water subsides the main fishery with nets begins. Fish form the chief food of man and dog, and for the yearly consumption of the hundred families that compose the little community of Nishney-Kolymsk, at least three millions of herrings are required. Many other kinds of fish are caught at this time, among which is the *Nelma*, a large description of salmon trout, but the first fish are generally thin, and are mostly converted into *yukhala* for the dogs; that is to say, cut open, cleaned, and dried in the air. From the entrails an abundance of train oil is obtained, which is used for food as well as for fuel. The *yukola* is distinguished from the *yukhala* merely by the selection of a better kind of fish, and by greater care in the preparation.

The proper season for bird hunting is when the animals are moulting, when having lost their feathers they are unable to fly. Large detachments are then sent off from the fishing stations, and numbers of swans and geese are killed with guns, bows, and sticks. The produce of this chase is

aid to have diminished greatly of late years. Formerly it was no unusual thing for the hunters to bring home several thousands of geese in one day, whereas now they are content if they can catch as many during the whole season.

While the men are fishing and hunting, the women make the best use of the interval of fine weather, to collect the scanty harvest which the vegetable kingdom yields them, in the shape of a few berries and aromatic herbs. The gathering in of the berries is a season of gaiety, like the vintage in southern climes. The young women wander about in large parties, spending the nights in the open air, and amusing themselves with song and dance, and other innocent diversions. The berries themselves are preserved by pouring cold water over them, and freezing them, in which condition they form one of the favourite dainties during the winter. Besides the berries, they collect at this time the *makarsha*, a mealy root found in large quantities in the subterranean storehouses of the field-mice. The young girls appear to have a peculiar tact in discovering the magazines of these little notable animals, whom, without the least remorse, they plunder of the fruits of their provident industry."

Such is life on the Kolyma during the short summer, a season of activity for all, for in addition to the chief occupations of which we have just laid a brief epitome before our readers, there are many other, though less momentous, calls upon the industry of the inhabitants. Their huts perhaps want repairing, their boats have to be mended, and in the forest the traps must be looked after. The Russians at Nishney-Kolymsk are supposed to set about 7500 traps in the neighbouring country, which are visited about eight or ten times during the winter, and at each visit they expect to find something in every tenth trap. The animals mostly caught are sables and foxes. The elks, the wild reindeer, and the wild sheep, also offer an attraction for the adventurous hunter, while others, more ambitious, wander forth in search of the mightier bear. The bear-hunters are the heroes of the Kolyma, and tales of their marvellous achievements form the standing topic during the long winter evenings, when old and young crowd about the warm *tshuval*, to while away their idle hours by the songs and traditions of their Russian ancestors as well as of their adopted land.

The best friend of man in almost every clime is the dog, but in Northern Siberia existence would scarcely be possible without the aid of this invaluable animal. All along the Arctic Ocean the dog is almost the only beast of burden. He is harnessed to the light sledge, or *narte*, which will carry no inconsiderable load, and in which, during winter, the natives perform journeys of incredible length. The Siberian dog bears a strong resemblance to the wolf. He has a long pointed snout, sharp upright ears, and

a long bushy tail. Some of them have short hair, others a tolerably thick fur, and they are met with of all imaginable colours. Their size also differs very much, but a dog is not thought fit for the sledge if less than one arshin and two wershok high, and one arshin and five wershok long.* Their barking resembles the howling of a wolf. They always remain in the open air. In summer they dig holes in the frozen earth to cool themselves, and sometimes they will spend the whole day in the water to escape from the persecution of the gnats. Against the intense cold of winter they seek shelter by burying themselves under the snow, where they lie rolled up with the snout covered by the bushy tail. Of the cubs, the males only are usually kept, the females are mostly drowned, only one or two being entertained by each father of a family to preserve the breed. The rearing of these dogs forms an important occupation, and requires no little skill and judgment. A dog may be put to the sledge when a year old, but cannot be subjected to hard work before his third winter. The team of a sledge seldom consists of less than twelve of these dogs, of whom one is used as leader, upon whose breeding and docility the safety of the whole party depends. No dog must be used as a leader unless he be perfectly obedient to the voice of his master, nor unless the latter be certain that the animal will not be diverted one moment from his course by the scent of any kind of game. This last point is one of the highest importance, and if the dog has not been well broken in, but turns to the right or left, the rest of the dogs will immediately join in the pursuit, when the sledge is of course overturned, and the whole pack continue the chase until some natural obstacle intervene to arrest their course. A well-taught leader, on the other hand, not only will not allow himself to be seduced from his duty, but will often display the most astonishing tact in preventing the rest of the team from yielding to their natural instinct. On the boundless tundra, during a dark night, while the surrounding atmosphere is obscured by the falling snow, it is to the intelligence of his leading dog that the traveller is constantly indebted for his preservation. If the animal has once been the same road before, he never fails to discover the customary halting-place, though the hut may have been completely buried under the drifting snow. Suddenly the dog will remain motionless upon the trackless and unbroken surface, and by the friendly wagging of his

tail announce to his master that he need only fail to work with his snow-shovel to find the door of the hut that offers him a warm lodging for the night. The snow-shovel on these winter excursions appears to be an appendage without which no traveller ventures upon a journey.

In summer the dog is no less serviceable than in winter. As in the one season he is yoked to the sledge, so in the other he is employed to draw the canoe up against the stream, and here they display their sagacity in an equally surprising manner. At a word they halt, or where an opposing rock bars their progress on the one side, they will plunge into the water, swim across the river, and resume their course along the opposite bank. In short, the dog is as indispensable to the Siberian settler, as the tame reindeer to the Laplander. The mutual attachment between the Siberian and his dog is in proportion to their mutual dependance on each other. M. von Wrangel relates remarkable instances of the extent to which he has seen some of the people carry their fondness for their dogs. In 1821 an epidemic disease broke out among the dogs in Siberia, and carried off many thousands of them.

"A Yukaheer family had lost the whole of the twenty dogs of which they had recently been possessed, and two newly-born cubs were all that remained. As these animals were still blind, and without a mother's care, it scarcely appeared possible to preserve them. The Yukaheer's wife, to save the last remnant of the wealth of her house, resolved that the two dogs should share the milk of her breast with her own child. She was rewarded. The two adopted sucklings thrived wonderfully, and became the ancestors of a new and vigorous race of dogs."

The sufferings of the poor inhabitants, in consequence of the loss of the dogs, through the epidemic malady that raged in 1821 and 1822, were dreadful in the extreme. Yet will it be believed, that an order was once actually issued by the government at St. Petersburg, to destroy all the dogs throughout the north of Siberia, "on account of their consuming such quantities of provisions, and thereby occasioning such frequent famines." The order was not executed, because it would have required the whole Russian army to enforce the command, and after a while means were found to enlighten the rulers upon the absurd tyranny of their proposed "reform." We see thus that England is not the only country where a colonial minister will at times indulge in the most extravagant vagaries.

Let us now accompany the Siberian into the interior of his hut, to which he returns as soon as the frost has put a stop to his fishing and hunting. The walls are care-

* Three Russian arshins make seven English feet, and each arshin is divided into sixteen wershok.

fully caulked with clay and moss; a fresh mound of earth is collected outside; the *tshuval* is repaired, and fresh ice panes fastened into the windows. All this is seldom finished before the beginning of December. Then the several members of a family begin to creep more and more closely around their warm hearth, where a crackling fire yields the native of the arctic zone his only substitute for the absent sun. The flame of the *tshuval* and of one or more lamps is then seen glimmering through the icepanes, while from the low chimney arises a glowing column of smoke, carrying up with it, every now and then, a complete shower of sparks. The dogs crouch about the house, and three or four times a day, at tolerably regular intervals, more frequently perhaps when the moon shines, they raise a most tremendous howling, which is audible to a great distance over the plain. A low door, lined with the skin of a reindeer, or, if possible, with that of a white bear, admits the stranger into the interior of this dwelling. There the father and his sons are seen mending their nets, or making bows, arrows, and hunting-spears. The women are seen sorting and dressing the furs which the men have perhaps brought home from their last visit to the traps, or they may be engaged in the feminine task of repairing their own or their husbands' garments, on which occasions the sinews of the reindeer are made to supply the place of thread.

The dainties prepared by the culinary skill of the Kolymaska matrons are not exactly calculated to excite the appetite of a Parisian gourmand. Fish and reindeer flesh form the invariable *pièces de résistance*, and train oil is the constantly recurring sauce. Yet, even with these scanty materials to go to work upon, female ingenuity is seldom at a loss to vary the bill of fare. An accomplished French cook will boast of his ability to dress eggs in 365 different ways, and the housewife on the banks of the Kolyma shows herself almost equally inventive. Thus we have cakes made of the roe of the fish, or of the dry fish flour pounded in a mortar. Then the belly of the fish is chopped small, and, with the addition of a little reindeer flesh and makarsha root, thickened with train oil, the delicate compound appears before us in the shape of a savoury forced ball. Smoked reindeer tongues are seldom produced, unless in honour of a guest, and small slices of frozen fish eaten raw are esteemed in these distant regions as highly as the *glace à la vanille* at the Café de Paris. Salt never enters their food, but is always produced if a stranger partakes their meal. Tea and sugar are seen only at the tables

of the wealthy, on which occasions the *yukola* or dried fish supplies the place of toast or biscuit, bread being a delicacy which few can afford to indulge in. Flour, always an expensive article, is seldom seen except among the aristocracy of the place, and is generally used for the composition of a beverage called *saturán*. This is prepared by roasting the flour in a pan, and stirring it into a paste, with a little melted butter or fish oil. Upon this is poured boiling water, and the infusion is drunk warm out of cups. Our author assures us the beverage is both nutritive and agreeable; but he had gone through a three years' seasoning, and custom may go far to reconcile the palate even to the *bonne bouche* of a Siberian cuisine.

Flirtation, courtship, love, and jealousy, still maintain their empire over the youthful heart, even in the remote north. It is the daily office of the young ladies of Kolymask to fetch water from the river, where a well is cut in the ice. Here the love-sick youth never fails to watch for the arrival of his mistress, and manifests his attachment by filling her pails, and perchance even carrying them home for her. Such an act of gallantry is looked on as a formal declaration of love, and always excites the envy and *médiance* of less favoured rivals. The hole in the ice is the daily gossiping place for the young of both sexes, and we can easily believe what we are told, that the fair damsels are exceedingly careful that the water pails shall be freshly filled every day.

Shortly after M. von Wrangel's arrival at Nishney-Kolymask, the little place was put quite into commotion by the arrival of Capt. Cochrane, whose delightful account of his *pedestrian* excursions through these regions are already well known to the British public. Our countryman remained some time there, and manifested a wish to accompany the expedition over the ice of the Arctic Ocean, for which the Russian seaman was preparing; 'but such an increase to our party,' says our author, 'on a journey where every additional pound weight of luggage had to be seriously considered, would have occasioned so many difficulties with respect to sledges, provisions, and the like, that I deemed it expedient not to avail myself of his offer.' Disappointed in his wish to join the main expedition, Captain Cochrane contented himself with accompanying a small party to the fair of Ostrownoye, whither von Wrangel despatched one of his officers to cultivate the good graces of the Tsheskoes, whose country he was about to visit. Previously to the departure of the Englishman, however, our author determined to astonish the good peo-

ple of the town by a splendid entertainment in honour of the stranger.

'It was on Twelfth Night that I invited all the élite of the place to a *wetsherinka* or ball. I chose one of the largest houses for the occasion. It belonged to a Cossack, who happened to be something of a violin player. The ball-room, about eighteen feet square, was sumptuously illuminated by several lamps of train oil. The walls and benches, having been subjected to a washing (an operation which it would be impossible to say when they had last undergone,) were ornamented with some attempt at drapery, and on the floor some yellow sand was scattered. By way of refreshments for the ladies, I had procured tea and lump sugar, together with a few plates of cedar-nuts. The supper consisted of some fish cakes, yukala, and frozen reindeer marrow. At five o'clock our guests appeared, in their best furs, and their gaudiest holiday attire. After the few first exclamations of wonder and admiration at the luxury and splendour of the entertainment, the ladies took their seats on the benches along the wall, and commenced singing some of our national melodies. The younger part of the company amused themselves with a variety of *jeux innocens*, and danced slowly and heavily, as though it had been a task, to the unaccountable tones which the not very pliant fingers of our musical host, an old reindeer hunter, contrived to draw from his cracked fiddle, two of the strings of which were of reindeer sinews, the other two of twisted silk. The men were grouped around the *tshuval*, and seemed exceedingly to enjoy the little addition of brandy which I offered them as a qualification to their tea. At ten o'clock the party broke up, and my guests departed with endless assurances of gratitude for the costly manner in which I had entertained them. Nor were these mere set speeches; on the contrary, they were honestly meant, for even in the subsequent years of our stay, the magnificent and delightful *Prasdnik* was often referred to, as a bright point in the gloomy uniformity of their customary manner of living.'

M. von Wrangel found on his arrival at Nishney-Kolymsk, that the necessary preparations for his expedition had been neglected, and all his endeavours to collect the requisite number of sledges, and the requisite quantity of food for the dogs having failed, he was obliged, for that year, to renounce his journey to the north over the icy surface of the Arctic Ocean. Not, however, wholly to lose his time, he determined to attempt a month's excursion along the coast, of which only a very small portion was at that time known. The inhabitants had long stood greatly in awe of the Tshuktshi or Tsheskoës, and had therefore seldom ventured further than the Baranow Rocks, which were deemed the frontier mark of the Russian territory. It was known, however, that the Tsheskoës themselves were little in the habit of venturing so far towards the Russian line, the coast from the Baranow Rocks to Cape Shelagskoi being generally left unoccupied by both parties, as a sort of neutral ground. Our author resolved accordingly to devote

the time that remained to him to a survey of the coast as far as the above cape.

The place of rendezvous was Sukharnoye at the mouth of the Kolyma, a "town" consisting of two uninhabited houses, to which a few families are in the habit of repairing during the fishing season.

"Fifty versts before reaching Sukharnoye we lost sight of the stunted shrubs, and found ourselves on one unbounded plain of snow, unbroken, unless here and there by an occasional fox-trap. A man accustoms himself, no doubt, to everything in time, but the first impression produced by this gigantic shroud admits of no comparison with any other object in nature, and night, by obscuring the spectacle, comes as a positive relief."

M. von Wrangel had sent one of his officers, as we have already seen, to the fair of Ostrownoye, a scene of which a lively description has been given by Cochrane, and with which we will therefore not detain our readers, though the spirited report of M. Matuschkin is one that will well repay perusal. It was while the one party was absent at the fair, that the gallant lieutenant, with another of his officers, started for Cape Shelagskoi. Nine sledges were prepared; three for the travellers, and six to carry fish for men and dogs; and as this species of travelling is one which none of our modern tourists have as yet had an opportunity of describing, we will endeavour to give our readers some idea of the appearance of the little caravan at starting.

We have already seen something of the winter travelling costume in these regions; and when it is borne in mind that the party contemplated a month's excursion in February over the ice of the Polar Sea, it will be taken for granted that none of the multitudinous appliances of furs on furs would be left behind. During the whole period of the journey, they could not once hope to obtain the shelter of a hut; the protection of an iceberg, to keep off the north wind, was the utmost they could look for when encamping for the night. A fire even was a comfort by no means to be relied on; for unless they found a sufficient supply of drift wood along the coast, it would be impossible for them to cheer their night's lodging by indulging in the luxury of a blazing log. These points must be borne in mind when estimating the delights of an Arctic sledging party.

"The articles we carried with us were the following:—a conic tent formed of reindeer skins, two hatchets, a pocket lantern, a few wax lights, a plate of iron to light a fire on, an iron tripod, a tea-kettle, a boiler, some changes of linen for each of us, and a bear skin as mattress, with a double reindeer skin counterpane for every two of the party. Our instruments were—two chronometers, a second

watch, a sextant with a quicksilver horizon, a spirit thermometer, three amplitude compasses, one of these with a prism, two telescopes, a riband measure, and a few other trifles. Provisions for five men for a month: $2\frac{1}{2}$ pood of rye biscuit, $1\frac{1}{2}$ pood of meat, 10 pounds of soup tablets, 2 pounds of tea, 4 pounds of candied sugar, 8 pounds of groats, 3 pounds of salt, 39 portions of strong spirit, 12 pounds of tobacco, and 200 pieces of smoked Yukhala. The cargo of each sledge was about 25 pood, tightly packed, and so closely fastened by means of thongs, that the sledge might be overturned many times without the least danger to any part of the contents. Perched upon the centre of the narrow vehicle sits the driver, his feet resting on the runner of the sledge, ready at a moment's notice to jump off. Immediately behind our drivers, Mr. Kosmin and myself sat perched, much in the same manner, likewise ready every moment to jump off, in case of our carriages losing their balance. Although each sledge bore 25 pood, yet it glided so easily over the frozen snow, that a man could have pushed it along with one hand; accordingly, the dogs, when the way was good, would run their ten or twelve versts in the hour."

The great inconvenience which attends this kind of travelling, consists in the difficulty of carrying a stock of food for the dogs. Thus, on the present occasion, three of the sledges were occupied by the travellers and their luggage, while the remaining six were almost exclusively occupied by fish for their cattle. This difficulty M. von Wrangel found means to obviate in some measure by burying a portion of the provisions in the snow, for a supply when returning; after which he sent the empty sledges back, and thereby husbanded his means. On this, his first journey, his magazines were found and pilfered by the bears, which placed the travellers and their dogs on exceedingly short commons on their return; but experience gradually taught them to make their snow cellars bear-proof, and in their subsequent excursions they almost invariably found their buried stores untouched.

The intense cold made it impossible for them to lay aside any part of their costume when preparing to make themselves "comfortable" at night, and even when they were fortunate enough to find an abundant supply of wood, they still suffered so much from the cold that they were frequently obliged to rise two or three times before morning, and warm themselves by running and jumping a little in front of the tent. M. von Wrangel made it a point, however, every evening to change his stockings; and his companion, M. Kosmin, had nearly lost the use of his limbs by neglecting this prudent precaution. The second or third morning after their departure, this gentleman complained that his feet were frozen. He was advised to change his stockings, which he had not done for two nights. "But when he pulled off his boots," says M. von Wrangel, "what was

our horror at seeing his stockings frozen fast to his feet. With the utmost caution we proceeded to relieve him from this painful situation, in doing which we found complete strata of ice of perhaps the tenth of an inch in thickness, within his stockings. Fortunately the feet themselves were not frozen, and after we had gently rubbed them with brandy for some time, he was completely restored." M. Kosmin was a Russian sailor, be it remembered, and surely it must have required all the iron constitution of his race, to enable him to overcome this little inconvenience with such perfect facility. The quantity of furs in which it was necessary for the travellers to encase themselves, made it of course impossible for the vapour thrown off by the skin to escape. This always occasioned moisture to collect about the feet during the day, and made it highly imprudent to pass a night without first taking care to secure the comfort of dry stockings.

The chronometers were perfectly useless, as it was impossible to protect them against the influence of the cold. M. von Wrangel carried them next his person during the day, and carefully took them to bed with him at night, cherishing them with all the fondness of a bridegroom. But all would not do. The delicate creatures could not live in a temperature of 40 degrees below the freezing point of Réaumur; the drop of oil within the works was converted into ice.

The two following winters were employed by our author in vain attempts to proceed northward, in search of the polar continent, the existence of which had long been an enigma, and which even the labours of this expedition can scarcely be said to have solved. At an inconsiderable distance from the coast, even during the most intense frost, the ice was always found so thin that the sledge was continually in danger of breaking through, a catastrophe that befel them on one or two occasions, though without any serious consequence. Beyond this thin crust of ice as far as the eye could reach, the sea was always open; but the horizon was seldom extensive, constant vapours issuing from the *Polinya*, as the open region of the ocean is called by the Siberians. Even in the severest winter the ice never extends more than 25 versts (16 English miles) to the north of the island of New Siberia,* and it is evident, from the experience of the past, that neither in sledges, nor in ships sailing from the Sibe-

* This leaves still 15° to the North Pole, and about 12° Southing from the pole, giving 27° for the *Polinya*, or open watery expanse, which certainly appears large, and is probably studded with islands, or contains a large polar land.

rian rivers, can any important results be obtained from future attempts to explore the Polar Seas. M. von Wrangel appears to abandon the hope that other navigators may be more fortunate than himself. It may seem presumptuous for landsmen like ourselves to hazard a contrary opinion; but while we were accompanying our Russian in his dreary excursions over the polar ice, we confess, the idea frequently suggested itself to our minds that his own remarks pointed out the only practicable means of reaching a more northern latitude. The impediment to his own progress (and the same remark applies to Lieutenant Anjou, who was employed, on a similar service, on a more westerly part of the coast) was always the open *Polinya*, in which very little drift ice was seen. The point therefore to be attained, is to get a vessel afloat on the *Polinya*. Every attempt to do this by sailing from the ports of continental Asia, has hitherto failed; but it remains to be shown whether a vessel built on the northern coast of one of the Laecheff Islands (on Koteluoi or New Siberia, for instance) might not be more successful. Even in the most severe winter, we have seen, the ice extends only sixteen miles to the north of these islands. Might it not then be possible for an officer to avail himself of the brief summer months, when the ice breaks up, to work his way through these sixteen miles? Once in the open water, he would have a fair field before him, and a few months' sailing might finally dispose of the long pending question relative to the existence of a large Polar land.

Russia has greater means at her command for the solution of this question than any other country; but there are no political impediments to exclude Englishmen from a participation in the enterprize. The expedition undertaken by Messrs. Simpson and Deane, along the north western coast of America, points out the only quarter within the British dominions from which farther attempts can advantageously be made, and the experience of Messrs. Anjou and von Wrangel indicates the means that must be employed to attain satisfactory results from those attempts. Some convenient locality might be selected near the mouth of the Mackenzie River. Abundant supplies of every kind could be forwarded thither during the summer, and in the winter means might be taken to ascertain, in sledges drawn by dogs, how far the solid ice extends to the north of the American continent. The dog alone appears adapted for this kind of service, for the heavier horse or reindeer would fall through the thin ice, over which

the dog passes with complete impunity; and experience has taught the natives of Siberia, that the dog is quite as applicable to the purposes of draught as any other animal, provided care be taken not to impose upon him labour beyond his strength. In a high northern latitude, indeed, even the reindeer is at a disadvantage when compared with the dog, for not only does the reindeer sink farther into the snow, besides breaking through the ice when thin, but the food for the reindeer is not so easily conveyed from place to place. We throw out these suggestions with perfect diffidence, and leave it to those better qualified for the task to inquire further into the practicability of the plan. In the mean time, let us, for a brief space, return to our adventurous author.

The journey northward, over the ice, was an undertaking of a far more serious nature than the little trip along the coast, with which M. von Wrangel had whiled away a portion of his first winter. He was now about to venture "out to sea," and had to prepare for even greater hardships than he had yet experienced. In the first place, drift wood he could scarcely hope to fall in with, and as only a small supply of so bulky an article could be admitted on the sledges, a warm fire was not to be thought of before his return to land. The only fuel taken with him was for the purpose of boiling water and making soup; and as soon as the cooking was at an end every spark of fire was extinguished, and the fragments of wood carefully replaced on the sledges. A Cosack belonging to the expedition was especially appointed to this part of the service. "He had to collect every splinter that fell on one side when the men were chopping up a log, and it was his business to see that no more was used than was absolutely necessary." The same extreme care and frugality was put into practice in the distribution of the provisions; all the bones and remnants of fish and meat were gathered together after each meal, and for the due discharge of this part of the service another special appointment was deemed requisite. A scanty supply of food and firewood was not, however, the only inconvenience with which the party had to contend. The sun's rays reflected from the dazzling surface of the snow were soon found to act most painfully, and before many days were over, every man was suffering from violent inflammation of the eyes. M. von Wrangel and his friends obtained relief by rubbing the suffering parts with spirit, and then covering their faces with veils of black crape. The sledge drivers had recourse to a more violent remedy, and one that few will feel disposed to

venture upon: they threw snuff into their eyes, "from which they suffered the most acute pain during the night, but were evidently much relieved on the following morning." Eventually, M. von Wrangel, to lessen the most serious inconvenience to which this kind of service exposed him, adopted the plan of travelling chiefly by night, and resting during the middle of the day.

An occasional bear-hunt, by the excitement and exercise to which it led, varied the monotony of their occupation, but for the most part the bears were frightened by the presence of so large a number of dogs, and seldom came within speaking distance. A successful chase, by furnishing a fresh stock of food for the dogs, was always a cause of rejoicing; if, on the other hand, the quarry got off, the party were doubly disappointed, first by the loss of the bear, and secondly by the exhaustion of dogs and men, which made it impossible to proceed much further for that day.

Easter Day is a solemn festival throughout the whole Christian world, but nowhere is it more solemnly celebrated than in Russia. Our author shows that even on the broad ice of the Frozen Ocean it is quite possible to mark the return of a particular day, by rendering it the honour due.

"Unprovided with every requisite for such a solemnity, we wished at least to unite in prayer at the same hour with our countrymen at home. A block of ice was carved and hewn with much care into the shape of an altar. Upon this was placed a picture of St. Nicholas, the Worker of Miracles, and before it we erected a staff, on which burnt the only wax light we possessed. M. Bereshnoi officiated as priest, and read the prescribed service of the day, while our Cossacks and sledge-drivers raised the choral hymn. Simple and unadorned as was our temple, the piety of the little congregation was sincere, and I may say, edifying. The festive banquet that followed was equally unpretending, consisting chiefly of some reindeer tongues,* reserved for the occasion, and a double allowance of brandy. What contributed more than anything else, however, to the cheerfulness of the day, was the extravagance in which we indulged, of not letting our fire go out. It was a moderate one, to be sure, but we all crept closely round it, and spent the remainder of the day, chatting sociably over the hardships and dangers we had passed, and the hope we all entertained of a safe return. No assembly was perhaps ever so cheerful and merry under similar circumstances, destitute as we were of everything that could in the most remote degree be constructed into convenience or enjoyment. Our chief comfort was, no doubt, our little blazing fire—a comfort of which we had so long been forced to deprive ourselves."

We have left ourselves no space to speak

* Mr. Latham informs us that the tongues we are in the habit of eating with the most unsuspecting innocence in this country under this appellation, are prepared from donkeys.

of the summer excursions which M. von Wrangel and his officers undertook, chiefly on horseback, through the surrounding country, or we would here introduce some of his animating descriptions of the reindeer hunting and wild-goose catching, which we have read with interest, and which nothing but the length to which our remarks have already extended prevents us from quoting. His fourth winter was devoted to his great and last tour on the ice, which he extended as far as the island of Koliutskin, the same as that discovered by Captain Cook, and entered on his chart as Burney's Isle. On this tour it was that our travellers entered into friendly relations with the Tshuktshi, of whom one accompanied them a considerable portion of the journey, in his reindeer sledge. The Tshuktshi still persist, in what they have always maintained, that there exists a large extent of land to the north of their own country; and an old chief even declared that on a fine summer day, from some rocks situated a little westward from Captain Cook's North Cape, he had frequently discerned mountains covered with snow, at a great distance from land.

"But in winter, he said, the eye could not reach so far, and nothing was then to be seen. In former times, he added, large herds of reindeer had sometimes arrived across the sea, probably from that northern land, but, having been hunted and scared by the Tsheskoes and the wolves, had always returned again. He himself had once, in April, seen a herd thus returning, and had followed it a whole day in his sledge, but the ice became so uneven, that he was obliged to give up the pursuit. In his opinion, those mountains did not form part of an island, but of an extensive region, like the Tshesko land. His father had told him, that once upon a time, one of their elders had gone thither, with some of his men, in leathern *baydars*, or boats, but what they had found there, or whether they had ever returned, he was unable to say. He asserted most positively, however, that the country was inhabited; and, as a proof, he added, that a whale, wounded by spears pointed with stones, had a few years since been thrown on their coast. Now as none of the Tsheskoes used such spears, the whale could have been wounded only by one of the inhabitants of the unknown land."

The argument about the spear is one of very little value, as it is known that on the north-western coast of America, and more particularly on the islands about Behring's Strait, such spears are still used. The old chief, however, appears to have been an intelligent observer, for in the course of his conversation with M. von Wrangel, to make his explanations more clear, he took up a piece of charred wood, and drew a tolerably correct map of the whole line of coast, from the Baranikha to the North Cape, marking all the most important islands, capes, bays, &c. In fact so proverbial are the Tshuktshi

for their cheerfulness and readiness of apprehension, that the Siberian Russians have long designated them as the "Frenchmen of the Tundra."

During this his last journey, M. von Wrangel again attempted to get to the North, but the same natural impediments again opposed his progress, and before he could return to the coast, a violent tempest came on, which broke the ice, and left the whole party afloat on a fragment of about fifty fathoms in diameter, on which they spent a night of painful anxiety, thrown to and fro by the billows of the ocean, and in momentary expectation of seeing their little island crushed by the enormous *torossy*, or icebergs, which were dashing about in all directions around them. As soon, however, as the storm subsided, the several fields of ice became quickly connected, and the adventurous travellers were enabled to proceed on their journey, which, notwithstanding the danger they had just escaped, they continued in a northerly direction. They experienced a second storm, and were again set adrift on the ocean, but this time the fragment was of a much larger size, being composed of a number of connected icebergs. To return to the "continental ice" they had to construct a kind of bridge with loose blocks of ice, and again they renewed their endeavours to proceed to the North. "We did so," says our author—

"Rather for the satisfaction of knowing that we had left nothing undone that it was in our power to do, than with any hope of a favourable result. Till noon (23d March) we had clear weather, with a light wind, which towards the afternoon became sharp, when clouds began to gather over us, while from N. W. to N. E., as far as our eyes could reach, the horizon was covered by the dense blue vapour which in these regions constantly rises from the open ocean. Notwithstanding this sure token of the impossibility of proceeding much farther, we continued to go due north for about nine versts, when we arrived at the edge of an immense break in the ice, which reached in both directions beyond our visible horizon, and which at the narrowest part was more than 150 fathoms broad. The sharp westerly wind we could see was widening the gap, and the current that set towards the East was running at the rate of a knot and a half. We climbed to the summit of one of the loftiest icebergs, whence we obtained an extensive view towards the north, and whence we beheld the wide immeasurable ocean spread before our gaze. It was a dreadful, melancholy, magnificent spectacle! On the foaming waves were tussled about, as though they had been mere feathers, icebergs of enormous size; the grotesque and colossal masses lay one moment inclined on the agitated waters, and the next were hurled with awful violence against the edge of the standing ice. The collisions were so tremendous that large fragments were every instant broken away, and it was evident that the rampart of ice which still divided the channel before us from the open ocean would soon be completely destroyed.

It would have been idle temerity to have attempted to ferry ourselves across, upon one of the floating pieces of ice, for we should not have found firm footing on our arrival. Even on our own side fresh breaks were continually forming, which assumed the forms of rivers rushing in different directions through a continent of ice. *We could go no farther!*

"With a painful feeling of the impossibility of overcoming the obstacles which Nature opposed to us, our last hope vanished of discovering the enigmatical land, of the existence of which it was still not allowed us to doubt. We saw ourselves compelled to renounce the object for which during three years we had constantly exposed ourselves to every kind of hardship, privation and danger. We had done all that duty or honour could demand from us; it would have been absurd to have attempted to contend against the might of the elements, and *I resolved to return!*

"According to my reckoning, the point from which I returned was situated in $70^{\circ} 51'$ N. latitude, and $175^{\circ} 27'$ E. longitude, from Greenwich. Our distance from the main land, in a straight line, was 105 versts. On sounding we found $22\frac{1}{2}$ fathoms of water, with a clay bottom."

On their return they had to ferry themselves across many fresh breaks in the ice, the dogs swimming, and towing after them the pieces of ice on which the sledges rested. In many places the old track of their sledges was interrupted by large *torossy*, a proof that the storms they had experienced must have broken the ice to a great extent behind them. They were again overtaken by a storm, were again set adrift upon an iceberg, to which they were a whole day indebted for their preservation. At length, however, their frost-built vessel became a prey to the hurricane. The mighty *toross* was hurled against the field of standing ice, and the violence of the collision shattered at once the mass that bore our travellers, and the mass against which it had been flung.

"The moment of our destruction was at hand. But at this dreadful moment, when escape seemed impossible, the native instinct of every living being acted within us. All of us at the same instant sprung upon the sledges, and urged our dogs to their full speed without knowing whither we went. The animals flew across the sinking fragments, and reached a field of standing ice, where they immediately ceased running, conscious apparently that the danger was over. We were saved. Joyfully we embraced one another, and joined in thanks to God for our miraculous preservation."

And here we must close our notice of one of the most attractive works of the kind that has for some years passed through our hands. The expeditions we have described embrace from longitude 67° east to 175° east, the immense sweep of 108° of east longitude in the highest attainable Asiatic latitude, bringing us to Behring's Strait from the distant Ob. Here our distinguished countryman, Captain Beechey, meets us, and carries us on the American continent until

stopped by the same impediments with von Wrangel, but with his points of survey of a far more accurate description. Inferior only to the late deeply lamented Captain Kater, receivedly the best manipulator of instruments of his time, far exceeding even the late astronomer royal, whose excellence on that point is well known, all Captain Beechey's observations are of the highest possible accuracy. The American coast will soon, we trust, be perfectly ascertained from Point Parry to Point Beechey. Whether a large Polar land extends beyond these discoveries, will soon form the only remaining northern desideratum. In conclusion we have simply to remark, that we are at a loss to comprehend the motive of the Russian government in keeping M. von Wrangel's narrative buried for so many years in the archives of the Admiralty. The public, we are sure, will feel indebted to Mr. Ritter, of Berlin, for the German version, and we presume some of our own publishers will, before long, present the work to us in an English dress.

With respect to the extraordinary details in this article on the mammoth bones, one of our most eminent geologists has stated to us his conviction that the diminution of the mammoth in size, as we approach the North Pole, is untrue. He considers that different species are confounded. The quantity of these remains does not surprise him, as bones in similar proportion are found along the north shores of Asia and America. The temperature of the earth, he conceives, must have essentially changed. The mammoth was a hot-blooded herbivorous animal, and not adapted to a marine life. We subjoin these remarks, which are of high moment, we conceive, and lead to speculations on change of climate, soil, &c. almost endless. The fidelity of Hedenström is of course not impeached; even supposing him to be in error.

ART. V.—1. *Faust: a Tragedy, by Goethe, translated into English Verse.* By John Hills, Esq. London: Whittaker & Co. Berlin: Asher. 1840.

2. *The Faust of Goethe; Part the First; translated into English Rhyme.* By the Hon. Robert Talbot. *Second Edition, revised and much corrected, with the German Text on alternate pages, and additional Notes.* London: J. Wacey, 4, Old Bond Street. 1839.

3. *Faustus, a Dramatic Mystery; the Bride of Corinth; the First Walpurgis Night; translated from the German of Goethe, and illustrated with Notes.* By John Anster, LL.D. (of Trinity College,

Dublin,) Barrister at Law. London: Longman. 1838.

4. *Faust: a Dramatic Poem, by Goethe, translated into English Prose, with Notes, &c.* By A. Hayward, Esq. Third Edition. London: Edward Moxon, Dover Street. 1838.

5. *Faust: a Tragedy, by J. W. Goethe, translated into English Verse, with Notes, and preliminary Remarks.* By John S. Blackie, Fellow of the Society for Archæological Correspondence, Rome. William Blackwood, Edinburgh. 1834.

6. *Faust: a Tragedy, translated from the German of Goethe.* By David Syme. Edinburgh: Adam and Charles Black. 1834.

7. *Goethe's Faust, Part II., translated from the German, partly in the Metres of the Original, and partly in Prose, with other Poems, original and translated.* By Leopold J. Bernays, Scholar of St. John's College, Oxford. London: S. Lowe, Lamb's Conduit Street; and A. Bielefeld, in Carlsruhe. 1839.

8. *Goethe's Faust, translated into English Verse, with copious Notes.* By J. Birch, Esq. London: Black and Armstrong. 1839.

9. *Faust: a Tragedy, by J. W. Goethe, Part II., as completed in 1831, translated into English Verse.* Dumfries: Printed for the Translator by D. Halliday. 1838.

THE above translations of *Faust* are but a few out of the many with which the press has been lately teeming. They are mostly of the First Part. But now that Mr. Bernays has given a literal version of the Second Part, no doubt the attempts at its versification will be equally numerous. Evidence enough exists, in all this, that the production has a deep and abiding interest for the German student, whatever be its aspect to the general reader. Meanwhile, the book needs interpretation to both, and thanks, we are continually told, would be deserved by him who could solve the enigma supposed to be involved in a poem that affects at the same time both the strange and the true. Have we the key? We think so. But be this as it may, we will not miss it for want of strenuous exertion, but do our duty in the task, difficult as it is, to which we are called.

Notwithstanding all that has been written on the First Part of *Faust*, much, from the nature of the subject, still remains to be said; and, though our main design in the present article is to treat of the Second Part, yet, if only by way of introduction, it will be expedient to dwell briefly on the first.

We are disposed to concur with Mr. Bernays in opinion, that the "Prologue on the Theatre," with which the First Part of *Faust* is introduced, has been too seldom consulted, and believe that it may be taken as the key to the mode of treatment adopted by the poet. The poem was composed in pieces, at wide intervals of time, and was at last made up by selection and rejection, of fragments produced in moments of inspiration. We have no doubt that Goethe had in his mind this mode of composing the poem when he put the following words into the mouth of his Manager :

*Mr. Talbot's translation.**

"You rule the many by the mass alone ;
He who brings much will bring to many a one ;
Each picks up something for himself, at least ;
Thus all go home contented from the feast.
Who gives a piece in *pieces* sure to please is ;
With such a hash they'll best be satisfied ;
The banquet, then, not only spread with ease is,
But is a world more easy to provide.
In vain the bard a finished whole submits,—
The house is sure to tear it all to bits !"

And so Goethe had written his piece by bits and scraps.

The above passage we have given in Mr. Talbot's translation. It is almost literally rendered. It may gratify the reader to see how other translators have managed the same lines,—and will certainly enable him to form some conception of the different styles of the different versions. Dr. Anster's is exceedingly diffuse.

Dr. Anster's translation.

"Would you please many, you must give good measure,
Then each finds something in't to yield him pleasure ;
The more you give, the greater sure your chance is
To please, by varying scenes, such various fancies.
The interest of a piece, no doubt, increases
Divided thus, and broken into pieces.
Such a ragoût is soon prepared, nor shall it
Be otherwise than pleasing to each palate ;
And, for my part, methinks it little matters :
Though you may call your work a finished whole,
The public soon will tear this whole to tatters,
And but on piecemeal parts their praises dole."

This is paraphrastic. The following, we are afraid, is bald :

Mr. Hill's translation.

"The mass you can subdue with mass alone ;
Each picks out what he feels for him was meant ;
Who much brings, brings a portion for each one,
And in the end, all leave the house content."

* "Die Massa könnt ihr nur durch Masse zwingen,
Ein jeder sucht sich endlich selbst was aus.
Wer Vieles bringt, wird manchen etwas bringen ;
Und jeder geht zufrieden aus dem Haus.
Gebt ihr ein Stück, so gebt es gleich in Stücken !
Welch ein Ragout es muss euch glücken ;
Leicht ist es vorgelegt, so leicht als ausgedacht.
Was hilft's, wenn ihr ein Ganzes dargebracht,
Das Publikum wird es euch doce zerpfücken."

Give you a piece ? then give it piecemeal too,
You cannot but succeed with such a ragoût.—
As easily dish'd up too as invented !

What needs it a great whole to have presented ;
'That we would pull to pieces straight for you."

The following is comical :

Mr. Blackie's translation.

"The mass can be compelled by mass alone,
Each one at least seeks out what is his own.
Bring much, and every one is sure to find,
From out your nosegay, something to his mind.
You give a piece,—give it at once in pieces,
Such a ragoût each taste and temper pleases ;
And is as easy to the bard's invention,
As from the players it needs small attention.
In vain into an artful whole you glue it,
The public, in the long run, will undo it."

Mr. Syme has not translated this prologue.

So much will suffice for samples of these different versions. Brief and facile as the passage is, it yields the reader a fair notion of the comparative merits of the different versifiers, and relieves us from the necessity of quoting them again in connection. Mr. Hayward's prose gives us the original without alteration :

"You can only subdue the mass by mass. Each eventually picks out something for himself. Who brings much, will bring something to many a one, and all leave the house content. If you give a piece, give it at once in pieces. With such a hash, you cannot but succeed. It is easily served out, as easily as invented. What avails it to present a whole ? The public will pull it to pieces for you notwithstanding."

Agreeing so far as we have above expressed with Mr. Bernays, we cannot agree with him, however, in supposing that the whole is an accidental result. *Au contraire*, we apprehend that, however fragmentary the mode of composition, the idea of the entirety was always in the mind of the poet, though in execution it was developed in parts. For if there ever was an artist who proceeded from whole to parts it was Goethe ; and, indeed, we perceive in this very prologue the proof of the fact. Here, if any where, we learn what is proper to the true poet, and what he has to expect from the vulgar taste. To the level of that Goethe never meant to descend.

At the present time, when so great a desire is expressed on all hands for the regeneration of our native drama, this prologue may be consulted with immense advantage. The dramatic poet in England yet, notwithstanding all professions to the contrary, is held in the bonds of actors and managers. He would do well to imitate the bold independence of Goethe's poet, as declared in the following glorious verses,—more glorious in Dr. Anster's translation than in the original.

"Go and elsewhere some fitter servant find ;
 What ! shall the poet squander then away,
 And spend in worthless, worse than idle, play,
 The highest gift that ever nature gave,
 The inalienable birthright of mankind,
 The freedom of the independent mind,
 And sink into an humble trading slave ?
 Whence is his power, all human hearts to win,
 And why can nothing his proud march oppose,
 As through all elements the conqueror goes ?
 Oh ! is it not the harmony within,
 The music which hath for its dwelling place
 His own rich soul—the heart that can receive
 And hold in its unlimited embrace
 All things inanimate, and all that live ?
 Then nature, like a tired and stupid sloven,
 Twists with dull fingers the coarse threads of life,
 When all things, that, together interwoven,
 In happy concord still agreeing,
 Should join to form the web of being,
 Are tangled in inextricable strife ;
 Who then can cheer life's drear monotony,
 Bestow upon the dead new animation,
 Restore the dissonant to harmony,
 And bid the jarring individual be
 A chord, that, in the general consecration,
 Bears part with all in musical relation ?
 Who to the tempest's rage can give a voice,
 Like human passion ? bid the serious mind
 Glow with the colouring of the sunset hours ?
 Who in the dear path scatter spring's first flowers,
 When wanders forth the lady of his choice ?
 Who of the valueless green leaves can bind
 A wreath—the artist's proudest ornament—
 Or, round the conquering hero's brow entwined,
 The best reward his country can present ?
 Whose voice is fame ? who gives us to inherit
 Olympus, and the loved Elysian field
 The soul of MAN sublimed—man's soaring spirit
 Then in the POET, gloriously revealed."

With this extract we close our specimen quotations,—remarking that, for poetic force and diction, none of the versions before us is comparable with Dr. Anster's, upon whom we impress the duty of presenting the Second Part also in an English dress, so clothed as only he can clothe it, with the stores of a rich fancy, and the graces of true poetic feeling. We are inclined to permit to him most of the licences that he exercises,—the addition of figures, the accumulation of phrases, and whatsoever else shall give to his production the air of an original. Were he to do this, we should feel that then we had both parts of Goethe's *Faust* in a style thoroughly English, and thoroughly poetic. In a word, the two parts of "*Faustus, a Dramatic Mystery*, by Dr. Anster," would form an English Poem, delightful to peruse, and desirable to retain, as a permanent accession to an Englishman's library.

So far, however, from meaning by his "*Prologue on the Theatre*," that he had proposed any concession to popular taste in the composition of his extraordinary drama, it was evidently Goethe's design to throw the utmost possible amount of ridicule on the proceedings of the mere playwright. He looked with perfect contempt on mere stage

effects, and all rules for commanding dramatic success in the theatre. He cared nothing for their *drops*, their *flats*, or their *set scenes*. Nay, he boasts of converting the manager himself, whom he portrays as giving full license to the poet. Thus :

"What you can do, or dream you can, begin it,
 Boldness has genius, power, and magic in it.
 Only engage, and then the mind grows heated,—
 Begin it, and the work will be completed !
 You know our German bards, like bold adventurers,
 Bring out whate'er they please, and laugh at censors :

Then do not think to-day of sparing scenery,—
 Command enough of dresses and machinery ;
 Use as you please,—fire, water, thunder, levin,—
 The greater and the lesser lights of heaven.
 Squander away the stars at your free pleasure,
 And build up rocks and mountains without measure.

Of birds and beasts we've plenty here to lavish,
 Come, cast away all apprehensions slavish,—
 Strut, on our narrow stage, with lofty stature,
 As moving through the circle of wide nature,
 Hurry with speed more swift than words can tell,
 Rapid as thought—from *Heaven*, through *EARTH*—
 to *HELL*."

The remarks we have just closed are as necessary as the first scene of a well constructed play, to prepare the mind of our readers for the matter that shall follow. Goethe in this drama proposed to exhaust the present resources of theatrical representation, and to initiate new—to set an example of a dramatic production, wherein the poet should be perfectly unshackled. But though in this way he secured to himself the utmost amount of variety, out of which every one might pick something for himself, he was careful to provide for the unity of the entire argument;—a task infinitely difficult, to combine elements so manifold into an unbroken whole.

What was the argument ? and wherein lies its unity ?

These points are as perplexing to most critics, as the plot of *Hamlet* to the players. In both instances, it is the philosophical scope of the subject, and its anomalous treatment, that embarrasses many. The origin, progress, and destiny of man, symbolized in an individual;—such is the wide argument and such the narrow unity proposed by either poet. No less a weight than this lies on the persons of *Hamlet* and of *Faust*. Herein, however, consists the human interest, notwithstanding the preternatural machinery, of the two characters. They are representatives of the race,—and belong, therefore, to us all. It is *we* who are *Hamlet*, *we* who are *Faust*. Hence the propriety of the numerous incidents in these dramas. Symbolizing so vast a theme, the poet was called upon to introduce the greatest number of types that could be entertained consistently

with the unity proper to a work of art. Hence it is that, in these tragedies, a Shakspeare and a Goethe have poured out more of their minds' wealth, than in their other productions.

This analogy between these two master-pieces of dramatic art has never, to our knowledge, been previously instituted. Yet Goethe himself has almost guided us to it, by his incomparable criticisms on the princely Dane and his sore trials, in *Wilhelm Meister's Apprenticeship*.

Hamlet and Faust are at the beginning both students about to throw aside their books, and mingle in the business of the world. Our dear Coleridge must here come in for some degree of reprehension for his misappreciation of Goethe's poem.

"The intended theme of the *Faust*," said he, "is the consequences of a misology, or hatred and depreciation of knowledge, caused by an original intense thirst of knowledge baffled. But a love of knowledge for itself, and for pure ends, would never produce such a misology, but only a love of it for base and unworthy purposes. There is neither causation nor progression in the *Faust*; he is a ready-made conjurer from the beginning; the *incredulus odi* is felt from the first line."

Alas! so hasty a misstatement shows in the critic little love for his author. Coleridge never heartily admired Goethe; and without admiration there can be no just criticism. He synchronised rather with Schiller; and seems not to have proceeded beyond that original opposition which was so significantly illustrated between the two minds at the first meeting of the two poets. But how well did they succeed in reconciling themselves one to the other!—All human progress presupposes the motion of a point through mental space. The library is the scholar's paradise—with what pleasure Hamlet refers back to Wittenberg! The difference between him and Faust is that Hamlet has just left, and Faust is just leaving, the scene of his studies. Perhaps, in Goethe's estimation, the difference was still more minute. According to him, Hamlet "was calm in his temper, artless in his conduct, neither pleased with idleness, nor too violently eager for employment. *The routine of a university he seemed to continue when at court.*" Granted. But this university routine to Hamlet is still that of a pupil—to Faust it is that of a master.

"I have now," Faust exclaims, "by zealous exertion, thoroughly mastered philosophy, the jurist's craft, and medicine,—and, to my sorrow, theology too. Here I stand, poor fool that I am, just as wise as before. I am called master, aye, and doctor, and have now for nearly ten years been leading my pupils about—up and down, crossways and

crookedways—by the nose; and see that we can know nothing! This it is that almost burns up the heart within me. True, I am cleverer than all the solemn triflers, doctors, masters, writers, and priests. No doubts nor scruples of any sort trouble me; I fear neither hell nor the devil. For this very reason is all joy torn from me. I no longer fancy I know any thing worth knowing; I no longer fancy I could teach any thing to better and convert mankind. Then I have neither land nor money nor rank in the world. No dog would like to live so any longer. I have therefore devoted myself to MAGIC."

We have preferred, on a point so important as this, to quote the *literal* translation. The result is, that we feel compelled to decide that it is not a hatred of Knowledge of which Faust must be convicted, but a sense of the insufficiency of Learning. Fatal error! to substitute learning for knowledge. How strongly is the distinction between the twain marked in Goethe's poem. Hence his vehement contempt of mere elocution in the orator. It is his maxim that "Reason and good sense express themselves with little art;" and he demands indignantly

"Are mouldy records, then, the holy springs,
Whose healing waters still the thirst within?
Oh! never yet hath mortal drunk
A draught restorative
That welled not from the depths of his own soul."

How indignant, too, that the name of knowledge should be usurped by mere learning!

"Why, yes! they call it *knowledge*. Who may dare
To name things by their real names? The few
Who did know something, and were weak enough
To expose their hearts unguarded—to expose
Their views and feelings to the eyes of men,
They have been nailed to crosses—thrown to
flames!"

We have said that the condition of mind here exemplified indicates a degradation of it from a previous state of higher excellence. Alas! the story of the individual is here the story of the race! The human intellect has needed ever and anon (to use Mr. Blackie's words*) to be "roused to new life from the icy night of scholasticism, and surrounded by the glowing but unsubstantial morning clouds of a philosophy of feeling and imagination." How admirably these words coalesce with those of Faust. "What you feel not, you will not get by hunting—what gushes not from the soul is void of original delight." And in these facts, whether true of the individual or the race, we recognize the perpetually recurring symbols of man's

* We may state, by the way, that the preliminary remarks to Mr. Blackie's translation are excellent.

fall and redemption. But throughout his dark strivings, he "is still," says the poet, who places the maxim in the mouth of the highest authority, "he is still conscious of the right way."

We should nevertheless err if we supposed that the commencement of *Faust* symbolised the progress of the human mind from the mere formulæ of the schools into the demonstrations of experimental science and the philosophy of experience and induction. We must believe that the hero has passed through these also, together with all criticism upon them, and has perceived feelingly the nothingness of them. For above all things, we should bear in mind, with Mr. Thomas Carlyle, that Goethe, in this wondrous poem, has not treated its subject as lying so much in the past as in the present. He recognizes in the present the same mysterious relations of which all ancient superstitions (however obsolete in some instances) were symbolic. Thus interpreted, the fable of Faust is *true* for all ages. But then, in every age, according to the doctrine of the critic before us, it must be represented in different types at different times.

"Goethe's manner of treating it" [he writes] "appears to us, so far as we can understand it, peculiarly just and happy. He retains the supernatural vesture of the story, but retains it with the consciousness, on his and our part, that it is a chimera. His art-magic comes forth in doubtful twilight; vague in its outline; interwoven everywhere with light sarcasm; nowise as a real Object, but as a real Shadow of an Object, which is also real, yet lies beyond our horizon, and except in its shadows, cannot itself be seen. Nothing were simpler than to look in this poem for a new 'Satan's Invisible World Displayed,' or any effort to excite the sceptical minds of these days by goblins, wizards, and other infernal ware. Such enterprizes belong to artists of a different species. Goethe's devil is a cultivated personage, and acquainted with the modern sciences; sneers at witchcraft and the black-art, even while employing them, as heartily as any member of the French Institute; for he is a *philosophe*, and doubts most things, nay, half believes even his own existence. It is not without a cunning effort that all this is managed; but managed, in a considerable degree, it is; for a world of magic is open to us, which, we might almost say, we feel to be at once true and not true."

And now, we think, that we hear some cautious reader objecting to our definition of learning and knowledge. Do you, he demands, to the defiance of etymology, include the sciences in the category of learning? To which we reply, in the first place, that a scholar's acquaintance with a science does not necessarily extend to a manipulative interference with its processes. We speak of course of discursive scholarship. This kind of scholar is in general content with a book-learning of its means and results; and

we might observe that Faust is introduced to us in his library at his desk, and not in his laboratory at his furnace. We will, however, waive this; since the knowledge sought by Faust is not any kind that can be obtained by any such process of experiment. All that the modern applications of the Baconian scheme of induction can present to the student concerns *effects*. This is all that natural means can achieve. Faust asks for what they cannot confessedly give him—the knowledge of causes! Hear him.

"I have therefore devoted myself to magic; whether, through the power and voice of the spirit, many a mystery might not become known to me; that I may no longer with bitter sweat be obliged to speak of what I do not know; that I may learn what it is that holds the world together in its inmost core, see all the springs and seeds of production, and drive no longer a paltry traffic in words." "Ye instruments, too, forsooth, are mocking me, with your wheels and cogs, cylinders and collars. I stood at the gate, ye were to be the key; true, your wards are curiously twisted, but you raise not the bolt. Inscrutable at broad day, nature does not suffer herself to be robbed of her veil; and what she does not choose to reveal to *thy spirit*,* thou wilt not wrest from her by levers and screws."

This knowledge of causes, it is clear, is attainable by no natural means? By what means then? The preternatural. And what are they? Alas! instead of inquiring of the Microcosm, or the world *within* man, Faust takes to the Macrocosm or the world without; which, too, he presumes to interpret by a sign, or diagram. Contemplating this, he too hastily exclaims: "Am I a god? All grows so bright! I see, in these pure lines, nature herself working in my soul's presence. Now for the first time do I conceive what the sage saith, the spirit-world is not closed. Thy sense is shut, thy heart is dead! Up, acolyte! bathe, untired, thy earthly breast in the morning-red."

But it is not, to adopt the language of Crollius, "in the visible and comprehensible anatomy of the great world" that the mystery is to receive solution. Faust ere long perceives it. "What a show! but, ah! a show only!" He desires the *spirit* in and by which the show is substantiated. The *spirit* of the earth therefore must be invoked, since the mere "anatomy of the great world" answers not the human soul's desires.

No investigation of nature will serve the turn; but spirit must be revealed to spirit. In order thereto Faust must first, as it were, project his own, in order, by self-contemplation, to learn what spirit is, and how, in its mirror, the spirit of whatsoever exists is re-

* Mr. Hayward has here translated *Geist* "mind;" but it must be "spirit," if we would understand the force of Goethe's meaning.

flected. At first in a kind of Berkleyian mood he identifies both; but soon learns that they are twain, and one the superior—so superior as to transcend conception. "Thou art mate for the spirit whom thou conceivest, not for me!" Nor for him! no; for he shadows forth at once the whole *noumenal* creation and its Creator—even the very manifesting Power itself to the purest intuition of his own most interior being that man can contemplate; or, yet more abstract, of the ineffable source which presciently it pronounces. No marvel that Faust is subdued by such a "fulness of visions!" ("*fülle der Gesichte.*") Despair seizes on his soul. But how much of it is due to the "body of death," which has so perplexed both saint and sage? Ha! will not suicide at once deliver either from the ignorance which confounds, and demonstrate at once to the bold adventurer that "man's dignity yields not to God's sublimity?" To die then is to live!

Faust, however, makes no such experiment. For as he is placing a phial of poison to his lips, bells are heard ringing and chorusses singing, "Christ is risen!"—for it is the festal season of Easter; pregnant with the assurance of a new covenant. Faust declares that he wants faith to believe—but nevertheless refrains from dying—for he thinks on his childhood, when "the full-toned bell sounded so fraught with mystic meaning, and a prayer was burning enjoyment." His tears flow—earth has him again.

And now begins the dramatic action which is to solve in the end all Faust's perplexities, and restore him to the simple faith and innocence of childhood. But first he must be tempted in the world's wilderness;—and his tempter, according to the decision of Goethe's only competent critic, is "the Devil not of superstition but of knowledge." Let the reader recollect well the kind of knowledge! Nothing less than the knowledge of causation, of the inmost soul of things, will suffice the great desire of his spirit. All other knowledge—even including the religious instruction of his childhood—has failed; yet in such religion is more hope than in any thing—this primal, ultimate want has been re-excited, and demands satisfaction. His heart yearns for a revelation, and acknowledges its record in the New Testament. But here again he is perplexed with the letter of the Word; nevertheless some professors have pretended to penetrate its spirit. Some, like Swedenborg, for instance, have claimed the possession of a peculiar and personal revelation for the purpose. But what are they to Faust? The transcend-

entalisms of philosophy have reduced all these to their due value. Scepticism has done it, and Kant, the destroyer of all, has done as much both for them and scepticism. Faust can neither doubt nor believe. Nay, he is prepared to *deny* that any thing is either to be doubted or believed—and, lo! the spirit which *denies*, eliminated from the carnal nature, stands before him; the Mephistopheles, who will admit nothing—no affirmation, whether positive or negative—who takes nothing for granted—for whom no principle exists—the antagonist of all inquiry and endeavour, to which nothing appears but what is deserving of annihilation—to whom no decision is possible, because no assumption is probable. Yet, after all, this negation of identity is rather a vague desire than an attainment, and makes little progress. Something yet unaccountably opposes itself to nothing; and identity triumphs over the annihilating efforts of the fiend.

Such is the necessary end of *all* speculation! Thus is reason herself baffled. A practical course of action is desirable. Come, says Mephistopheles, "away into the world with me"—the field of the senses is the true sphere of exertion for man.

At this point the poetry of the drama commences—for, until the subject of a poem is reduced to the sensuous it is unavailable for the artist's purposes. "Poetry," says Milton, "should be simple, sensuous, and impassioned,"—Goethe required no less. His great complaint of Schiller was (according to Eckermann) that he preferred ideas to nature; Goethe, for his own part, studied the symbol more. Thus, in regard to the Helena, which forms so efficient a portion of the second part of Faust, Goethe rejoiced that "all had sensuous life, and on the stage would satisfy the eye. More," he adds, "I did not wish. If only the crowd of spectators take pleasure in what is obvious, the initiated will detect the higher meaning. Such has been the case with the Magic Flute, and other things of that sort." Goethe evidently too preferred the Second Part of Faust to the First, because of the superior objectivity of it. Of the First Part he said, that it was incommensurable, and that all attempts to bring it nearer to the understanding are in vain; adding, that "it should be considered that the First Part is the product of a somewhat obscure era in my mental progress." Such are the remarkable differences that often exist between authors and readers.

The reason why the Second Part of Faust has failed of its due appreciation is, perhaps, owing to its comparative want of obscurity.

No one can fail to believe with Goethe that the "very obscurity of the First has a charm for men's minds, exciting them to thought, as all insoluble problems do." Shall we, however, gain popular consent to the greater clearness of the Second Part? The appeal must not lie in any popular court. The argument is elevated altogether away from the popular mode of perception. It addresses itself not to the actor in life's busy scenes, as does the tale of poor Margaret, sacrificed that Faust may grow wiser by experience, and saved in the next world because the sinner in this met with forgiveness from the Eternal Mercy:—but it appeals to the operative intelligence itself, to the artist's sense of skill and the powers that belong to the best developed natures. In the classical carnival, Goethe was accordingly careful of the picturesque effect of the mythologic figures. In these and other arrangements he was solicitous that while the whole was incommensurable, the parts should be clear and significant. Eckermann points out corroborations of this, which we have already indicated to our readers.*

This is an important rule of art, and there can be no student of either Faust who has not almost consciously felt its influence. By reason of it, while the Whole offers an insoluble problem, each Part is distinct and plain enough. Goethe desired that we should contemplate the entire fourth act of the second Faust in this manner; as bearing "a quite peculiar character, so that it, like a by-itself-existing little world, need never touch the others, and is only connected with the whole by a slight reference to what precedes and follows it."

Goethe seems very much to have plumed himself upon his *Classical Walpurgis Night*—and, however much undervalued by some English critics, held that a mind less prepared and developed than his own would have found the work impossible. He compared it with the old Walpurgis Night, which "is monarchical, the devil there throughout being respected as chief"—while the *Classical Walpurgis Night*, he tells us, "is republican: in it all stand on a plain near one another, so that each is as prominent as his associates, nobody is subordinated or troubled about the others." But it will here be convenient to quote again from Eckermann direct:

" 'And,' said I, 'the classic assembly is composed of sharply outlined individualities, while, on the German Blocksberg, each individuality is lost in the general witch mass.'"

" 'Therefore,' said Goethe, 'Mephistopheles

knows what is meant when the Homunculus speaks to him of *Thessalian* witches. One acquainted with ancient times will have many thoughts suggested by these words (*Thessalian* witches), while, to the unlearned, it remains a mere name.'

" 'Antiquity,' said I, 'must be very living to you, else you could not endow the figures with such fresh new life, and use them with such freedom as you have.'

" 'Without a life-long acquaintance with plastic art,' said Goethe, 'it would not have been possible to me. The difficulty lay in observing due moderation amid such plenty, and resolutely avoiding figures that did not fit into my plan. I avoided, for instance, using the Minotaur, the Harpies, and other monsters.'

" 'We then spoke of the conclusion, and Goethe directed my attention to the passage—

Rescued is the noble limb
Of the spirit-world from the bad one:
For he who toils and ever strives
Him can we aye deliver:
And if indeed with him a part
Love from above hath taken,
The blessed armies him will meet
With heartiest of welcomes.*

" 'These lines,' said he, 'contain the key to Faust's salvation. In himself, an activity becoming constantly higher and purer, eternal love coming from heaven to his aid. This harmonises perfectly with our religious views, that we cannot obtain heavenly bliss through our own strength, unassisted by divine grace.'

" 'You will confess that the conclusion, where the redeemed soul is carried up, was difficult to manage; and that I, amid these supersensual matters, about which we scarce have even an intimation, might easily have lost myself in the vague, if I had not, by means of sharply drawn figures and images from the Christian Church, given my poetical design the desirable form and compactness.'

These notices of the poet's manner of proceeding are invaluable, as letting us into the secret of his plan of construction—the purely artistic method in which he performed his task. As the production of a very old man, it is a miraculous piece of work; but we go not along with them who use the argument of age as an apology for its comparative inferiority. Most sequels have been inferior to the original poems; but not so this of *Faust*: we are of opinion that Goethe was right in the feeling that he entertained of its excellence. Some reasons for this will probably suggest themselves to the reader in the course of our remarks.

The English public have now ample means of deciding this or any other question that may arise as to the poem. One translation in literal prose, and another in nearly as literal verse, may now be had. For the former we are indebted to Mr. Bernays, whose thorough acquaintance with both languages has enabled him to do for the Second Part of *Faust*, at once, and once for all, what the First Part wanted long in vain—a

* Foreign Quarterly Review, No. XXXV.

* Bernays' translation.

correct prose version. Previous to Mr. Hayward's translation, every possible error was committed in the metrical versions that were attempted; but the first appearance in English of the Second Part is under every advantage of accurate rendering. We cannot overvalue this great benefit, and shall be inclined to rate it very high, if we consider the difficulties of the undertaking. These were of a very uncommon character, including new forms and phrases of German construction, and a world of allusions, in which errors may very readily be made. Every thing, too, in this Second Part, depends on minute points—it being the intention of the author to suggest more than he expressed. It may almost be said that every line is symbolical of some moral lesson or intellectual maxim—has reference to some recon-dite research, or some elaborated conclusion from a wide treasury of learning or argumentation.

Extravagant notions have been formed of the solution which Goethe was to give of the problem of man's destiny at the conclusion of his poem. Even Mr. Hayward seems disappointed that, after the very impressive statement which had been made at the outset of such problem, the poet should leave us with a most orthodox theological decision, which no churchman would be disposed to dispute. We think, however, that it is a mistake to consider Goethe as the setter-up of new doctrines. He seems even to have had a repugnance for them, and was more led by authority than may be supposed. He was no innovator—wanted no new creeds, though not stedfast in existing forms—but as he chose an old legend for his fable, simply adapting its shape to modern modes of opinion, so he preferred, for the most part, old beliefs with a new interpretation. He meant not to impress the reader, as Dr. Anster supposes, either with the opinion that the human being only needs increase of light to release him from error and perplexity, or that a removal of inconvenient circumstances is the ultimate rescue for which man has to hope. On the contrary, it is clear that he insists upon a change of nature and heart as constituting the redemption of man, and considers this of so difficult accomplishment, that, though by the divine mercy an individual may be justified on earth, yet no sanctification is possible for any one but in heaven.

Nor was it needed that a new way of salvation should be pointed out by the poet. It is indeed no part of any poet to invent theological or metaphysical dogmas—his concern is with the illustration of ideas, by means of apt symbols in nature and experi-

ence. What we have gathered from Eckermann shows that Goethe aimed at nothing more than this—he sought to be a poetic artist, but no revealer. In fact, he was only too little of an enthusiast; the temper in which he most delighted appears to have been the ironic. Men and their interests were to him but the counters, which served his purpose well enough as the materials to be combined and opposed in a work of art. He seems to have survived all sympathy in the actual business of life. Whatever sympathy or enthusiasm may be shown in the First Part of *Faust*, none is left in the Second. There is in the First some passion—some emotion; but the pathetic, whether beautiful or sublime, is altogether wanting in the Second. It is an epic satire.

We can easily imagine, that in such a poem, having man for its subject, the most heterogeneous elements would mingle, and the more confusedly the better. Shadowy to the extreme, accordingly, is the sequel before us—shadowy and unreal. Pharsalian fields and Gothic castles mingle in one and the same dream; sphinxes and seven-leagued boots appear together; Hebrew and Greek mythology are identified; and Helen Rediviva blends visions of the classic and romantic—of the past and the present; the whole presenting a *Märchen* of the most extraordinary kind, in which (to adopt Mr. Bernays' statement) "plains and mountains in the land of no where; emperors and rival emperors, marshals and archbishops, fools and fanstasts, nameless and dateless," unite to perplex the visionary. We have, however, failed to study the work sufficiently, if we have not discovered, in this immense variety, a beauty and a completeness, such as belong to few works.

Bear we in mind, however, that this specific work was not meant for the public, technically speaking. For popular productions of all sorts, Goethe seems to have had latterly a most thorough contempt and wise scorn. We refer our readers again to the *Foreign Quarterly*, No. xxxv., where Eckermann's conversation with Goethe is fully detailed.

The true critic therefore will be slow to condemn these productions on the score of their unpopularity. He will concede the point at once, and will then be prepared to contend for the propriety of the poet's conduct. Heaven knows we have enough of writing *down* to the vulgar mind—we have enough of Jack Sheppardism; the age stands in no need of such fare, if it have an appetite for it. But we want, deeply want, authors who by education and rank are fitted to treat the loftiest subjects with true dignity,—au-

thors who have leisure and means to bestow the last polish on their productions,—authors who would write *up* the general taste, instead of degrading their own to the market level. Let us therefore hail these different versions, however imperfect they may be, of a noble poem, embodying the wisdom and life-long experience of a man whose opportunities of observation and ability to turn it to account were such as few can realize. It is true, that we cannot much praise the metrical translation of our Dumfries friend, but that shall be welcomed until we get a better. Meantime, be it known, that it is not wanting in fidelity, if in elegance. And the same observation applies equally to the version now before us by Mr. Birch, which in some places has the merit of closeness to the original beyond most translations, but is strangely capricious in its metrical arrangements.

Elegance,—the utmost elegance and polish, however, are required of him who shall undertake to translate the Second Part of *Faust*. The German original, is, in its versification, almost, if not quite, unrivalled. The translator should not suffer a defective line to remain. An imperfect rhyme even should not be permitted. The form of such a poem is greatly more important than the substance. Its minute arrangements should be all of a pleasing tendency; its parts must charm, in order that the whole, spreading as it does intentionally beyond the comprehensible, may not be suspected of inartificiality. The poet, once convicted of bungling in the minor points of his art in which mere versifiers may excel, forfeits all claim to our faith in those higher branches of endeavour which are obvious to but few, and perhaps understood by none. All this is well provided for in the original, and should be realized in the translation.

An adequate translation of both parts, notwithstanding the excellence of Dr. Anster's and Mr. Talbot's versions, is yet a desideratum in English literature. But in order to this, the translator should be possessed, as far as possible, with the spirit and scope of the poem. Having attained to the requisite insight, he should then keep as close, both in measure and phraseology, to the original as possible. The alteration of a single word will sometimes disturb the poet's meaning. Above all, he should avoid being more verbose than his author. He should not seek to decorate more than the poet has already done. This is the one only fault of Dr. Anster's version, that he writes not in Goethe's style, but in his own. We want the sharp, decided, frequently dry, and bald form of expression, that distin-

guishes the German. We are jealous of artifices of style—of accidental images—we demand verbal fidelity. We do not want a translator like Pope, who supplies images not in his author, however elegant in themselves, but a fidelity equal to that displayed in the celebrated version of the *Odyssey* by Voss. We would not have the translator solicitous for poetical diction. There is nothing of this in the part of Mephistopheles, and he must look the prosaic expression full in the face, and give it in all its native bareness in the one language as in the other. We know the difficulty of this: we give full credit to Dr. Anster when he says, "In our language it is scarcely possible to preserve the form without somewhat of the colouring, or at least of the conventional language of poetry. Scarcely any skill will enable a writer of verse to preserve the colloquial diction throughout; and I fear, that were he perfectly successful, the effect would be in a little time that of tediousness. With all his mastery, and with his unequalled humour, Swift is surely tedious; Butler, if still read, is felt to be a weary study; and more than the name of Byron, who is certainly more readable than either, is probably little known." All this is true, but must be put up with. Besides, in the *Faust*, there are other passages as well as the sneering and the sarcastic—passages of sentiment, reason, and passion; and if all were to be rendered poetically, there would ensue an apparent deficiency of that skill which requires a proper distribution of light and shade. Let the Mephistophelian irony be rendered therefore as literally, yet as carefully, as possible, avoiding all shifty expletives and false rhymes, and then leave the part to its fate. It will all turn out to be in proper keeping.

We are desirous of assisting any future translator in the proper conception of his task. Would he apprehend the scope of the poem? Let him read the last lines:

Chorus Mysticus.

"All that doth pass away
Is but a symbol;
The Insufficient *here*
Grows to Existence;
The Indescribable
Here is it done;
The ever-feminine
Draweth us on."*

These last two mystical lines indicate the

* *Chorus Mysticus.*

"Alles Vergängliche
Ist nur ein Gleichniss;
Der Unzulängliche
Hier wird's Ereigniss;
Das Unbeschreibliche
Hier ist es gethan;
Das Ewig-Weibliche
Zieht uns hinan."

principle sought by Goethe to be embodied in Faust's loves. The scene, which the Chorus Mysticus concludes, celebrates Faust's glorification. We are informed by the younger angels that they had been enabled to rescue the soul of their hero chiefly by means of the roses which they had received from the hands of love-hallowed penitent women, and to which was attached an influence so potent that even Mephistopheles and his imps were subdued by touches of affection that proved irresistible. There is a great and beautiful meaning veiled under the seemingly ludicrous catastrophe of the poem, in which the old fiend is made to fume so hotly in love's flames. Goethe had told Madame de Stael that he designed to scandalize the religious world by returning Mephistopheles to heaven, and including him in the salvation intended for Faust. This, though a part of his Pantheistic system, he very wisely left alone; and, instead, prepared a mere puppet-show kind of ending, in which he continued his purpose of reducing the highest truths to the humblest symbols, and presented the Vice of his miracle-play as quite bewildered with the beauty of young angels. In some of the verses (though a tone of levity, the demon property from which Mephistopheles can never consistently part, is purposely preserved throughout) the sublimer significations are apparent, *e. g.*

"Is this indeed Love's element?

My frame entire in flames is standing,

I scarcely feel how in my neck it burns!" &c. &c.

Beauty is throughout the attracting power whose influence is to allure man to the highest aims. What though, as in the case of Margaret, it lead to sin and sorrow, yet, as the daughter of Love, Beauty is desirable, and the happiness desired by the lover is a creative and genuine Socratic good. What if the love be without fidelity? Are we not counselled by the Platonic moralist to proceed onward from beauty in one form to beauty in many, or in all, until we rest at last in the love of the absolute beauty itself? This love for beauty, it is clear, had to be generated in the heart of Faust, during the first part of the drama. But the beauty was mortal as the form in which it was worshipped and then neglected. Of this guilt Faust at the commencement of the Second Part has repented.

Mr. Bernays affords us a fine intuition into the object of the Second part: "The Second Part opens with a chorus of good spirits, pouring the streams of Lethe over the anguished mind of the seducer; a plain mythos of the soothing powers of repentance, by which sin is washed away, and peace is restored to the troubled bosom."

But in addition to this we must add, that the Faust of Goethe is an adumbration of the spirit of the poet's times. Perhaps this is alluded to in the well-known passage of the scene with Wagner: "My friend, the past ages are to us a book with seven seals. What you term the spirit of the times is at bottom only the author's own spirit, in which the times are reflected. A miserable exhibition, too, it frequently is! One runs away from it at the first glance! A dirt-tub and a lumber-room!—and, at best, a puppet-show play, with fine pragmatistical saws, such as may happen to sound well in the mouths of the puppets!" We learn from Eckermann, that it was Goethe's intention that we should conceive Faust to be 100 years old at his death. We may therefore look upon the entire work as shadowing the century in which Goethe lived, and from his book we must endeavour to interpret "the author's own spirit, in which the times were reflected." The plan allowed the poet to reflect himself throughout in it; accordingly we find, upon a reference to the *Dichtung und Wahrheit*, that the feelings he ascribes to Faust in connection with the joyous bells and songs of Easter, were the very same that he experienced himself when a boy! Rightly, however, to interpret either the spirit of the poet or his times, we must look into our own spirit, and peruse there carefully the reflection of both. This the reader must do for himself; we could not, even if we had now space, do it for him.

Notwithstanding this application of the old legend to the present time, the details of the original fable are preserved in the general platform of the poem. To understand, therefore, who the emperor is to whom Faust is introduced, we must go back to the past. It suited Goethe's purpose to leave the emperor unnamed; and for this he had warrant in the doubt as to the personal identity of the historical Faust. There are in fact two Fausts—one the printer, and a latter one, the hero of magic. It is true, indeed, that some of the *Volksbücher* ascribe to the Emperor Maximilian what is generally told of Charles V., viz. that Doctor Faust conjured up before him the apparitions of Alexander the Great and his queen; but the other tricks, which were played before Cardinal Campegio and Pope Adrian, agree better with the age of Charles V. than with that of Maximilian. It is quite possible, however, that Faust may have exhibited his magical skill before both these emperors, who reigned from 1492 to 1553, Maximilian dying in 1519; at all events, even the date of Maximilian will never bring us back to the era when Faust the printer was

in his glory. Goethe, in the Second Part of *Faust*, has, in Mr. Blackie's opinion, "most wisely left the matter in uncertainty, by not mentioning the name of the emperor before whom he makes Faust play off his pyrotechnic tricks, which seemed to metamorphose his imperial majesty into a king of salamanders."

In the masquing scene there is much intentional obscurity. The emperor takes the part of Pan—Faust, of Plutus—and an unborn soul assumes the shape of a boy-charioteer. But on this last curious point hear Goethe himself, in Eckermann :

" 'We spoke of the boy Lenker.'

" 'You have discovered Faust under the mask of Plutus, Mephistopheles under that of Avarice ; but who is the boy Lenker ?'

" 'I hesitated, and knew not what to say.

" 'It is Euphorion,' said Goethe.

" 'But how,' said I, 'can he, who is not born till the third act, appear here at the carnival ?'

It required some mysticism to get out of this naive inquiry :

" 'Euphorion,' Goethe replied, 'is not a human but an allegorical being. In him is poetry personified, which is bound down to no time, no place, and no person. The same spirit who is afterwards pleased to appear as Euphorion, is here the boy Lenker, like ghosts which are present every where, and can appear at any hour.'

This proves the very arbitrary arrangement which sometimes Goethe adopted. Ghost and mere personification, however, as is the character of the boy-charioteer, it had also a flesh and blood reference to the things and persons of the century which the poem, as we have seen, intentionally illustrates. Goethe seems to have had a higher regard for Lord Byron than posterity will probably sanction. The part of Euphorion had especial reference to England's noble Child, of whom the German poet thought that he "could not make any man the representative of the modern poetical era except him, who undoubtedly is to be regarded as the greatest genius of our century." "He," said Goethe, "is neither classic nor romantic, but the reflection of our own day. He suited me in every respect, with his unsatisfied nature and his warlike tendency, which led to his death at Missolonghi. It was neither convenient nor advisable to write a treatise upon Byron : but I shall not omit to pay him honour at proper times. I thought of a different close for Helena at one time, but afterwards, this of Lord Byron pleased me better." Byron is none other than the child of Faust and Helena, the magically begotten Euphorion, brought up to maturity in a magic cave. Of all this, the reader will make what he can in perusing the poem.

There is a perplexed mixture of history and allegory in the whole of the interlude—intended to represent the genesis and exodus of both classic and romantic poetry, and the influences that led to the production of the Byronic School.

We believe that no man, after this statement, will accuse Faust of guilt for having forgotten poor Margaret in the arms of Helena. Plain enough it is to all, that this liaison is of a very intellectual character at all events. Adultery with Helena of Troy, by the Faust of the nineteenth century ! Could this have ever been understood literally ? How easy were the solution, even if Goethe had not given it himself—the union of the classic and romantic, and its offspring, the poetry of the cycle which has just closed. In all this, Faust is not so much an individual as the type of his species. The episode of Wagner and the Homunculus which the former chemically constructs, are designed to adumbrate the scientific attributes of the age. But the speculations and manipulative methods of the closet are but for a period. Man would apply these to the condition of the species and of the earth. Annihilate we do not space and time by railroads and steam-carriages, and by even swifter mental currency the electric telegraph ? It is required that reason should begin to bear upon the outer world, and modify it to her own high aims. Faust has also his task to perform—he would reclaim land from the sea—and, having obtained from the gratitude of the emperor, for whom he wins a battle by magical aid, the grant of an extensive line of coast, performs the feat. But what can satisfy the infinite desires of sovereign reason ? What though Faust has won a world from the waves ; there is a cottage of an honest old couple that impairs his prospect. The inconvenience must be removed by fair means or foul. Mephistopheles being the agent, foul means are preferred—the cottage and its inhabitants perish in flames. Faust may now enjoy his prospect—but his steps are dogged—Guilt, Want, Care, and Misery are at his heels—and blindness has plunged his eyes in night. Still would the blind old man be busy. Surrounded with workmen, conducted by Mephistopheles as their overseer, he enjoys the highest possible triumph, and falling back, dies with words of exultation on his lips. Whereupon Mephistopheles suggests the signification of the whole in these few words—"No pleasure satisfies him, no happiness contents him ; so is he ever in pursuit of changing forms."

Such is the state of man. Charmed and attracted by ideal beauty, in the early peri-

ods of the world and of life, man sees a Helen in every female form he meets, a charm in the rudest arrangements of nature or of life—by reason of the witch draught in the body of humanity; next intellectual pleasures delight, and then rational; these gratified, the more active joys of conquest, dominion and ever-teeming invention demand realization. But in vain—the proper objects of these far-reaching wishes are neither visible nor earthly—they await us in eternity.

In the scene of Faust's salvation, Goethe has adopted the church symbols, and carefully introduced the Virgin Mother, as the abiding incarnation of the Spirit of Beauty. In all this Goethe has been careful to intrench himself within the recognized and precedented; but he was not always willing to content himself with old images. Thus in the first act he actually creates a new company of mythological personages, having no foundation for his invention but a statement in Plutarch that in ancient Greece the Mothers were spoken of as divinities. Goethe's commentators have been terribly puzzled with these same goddesses; but Eckermann has now settled the question. The Mothers of Goethe are the creating and sustaining principles from which all phenomena on the surface of the earth proceed. Whatever ceases to breathe, returns in its spiritual nature to them, and they preserve it until a fit occasion rises to embody it anew. All souls and forms of what has been, or will be, hover like clouds in the Hades that is their dwelling. Thus are the Mothers surrounded, and the magician must be able to enter their dominion, if he would obtain control over the forms of beings, and have power to call back previous existences to teeming life. The eternal metamorphosis of earthly being, birth and growth, destruction and new formation, are also the unceasing care of the Mothers; and, as in all which receives new life on earth, female influences are most busy, these creating and sustaining divinities are thought of as females, and may rightly receive the name of Mothers.

The poem must, in fine, be apprehended as a whole. Let us not, however, forget that the whole of this singular poem is confessedly incommensurable, though the parts of which it is composed are meant to be intelligible enough. Parts?—they are rather many wholes included in one universal whole; so segregated are they each in its entirety from the others, and yet so subtilly related with all. Let us now learn that the point of art with Goethe in this poem was not to solve the riddle of the universe, but to create as great a riddle, by presenting in

a poem a certain totality of symbols in an order of arrangement which was a secret in the mind of the author. In such a work it was scarcely possible that any thing not having some indefinite relation to so indefinite an aggregate could be introduced. Accordingly, he has interspersed, particularly in his *Walpurgis Night*, allusions to his literary contemporaries, and points of mere temporary and local interest, as serving to produce a feeling of heterogeneity, highly favourable to his aim. It matters not whether we can or not explain these minute references, the mind may rest well content with the broader outlines and more striking incidents, particularly those which are characterized either by pathos, imagination, or philosophic insight. The whole—such is the burthen of this extended song, and teaching the moral too rather by example than by precept—"the whole is a mystery—it is only the parts that can be understood." The poet sought not to reduce the wonderful to any level of interpretation, but left it at the end of his labour the very wonderful that it was at the beginning.

The analysis which we have now concluded shows clearly enough why poems written in imitation of *Faust* have failed. Their authors have entirely mistaken the end and method of their model. They have in general instituted their composition as a means of lashing themselves up into states of ideality and strange and wild vagaries of passion and modes of treatment. All this is erroneous. Goethe's scenes were not steps in a chase after new revelations—not so many throes for the parturition of new and daring speculations. Instead of all this, he sought merely to accumulate and to arrange an immense multiplicity of expressive symbols, in illustration of truths that never have been doubted and defy invention. These truths he possessed in utter calmness of soul, and had no anxiety but how to dress them forth, and with what exponents to accompany them. In every line, accordingly, there are traces of masterly execution, and a union of the meditative and the active, of which no other instance exists, except Shakspeare's *Hamlet*. The Prince of Denmark, however, died in his youth; *Faust* lives to an extreme old age, and offered therefore a wider field for examination.

The sublime argument of both dramas furnishes intuitive testimony to the soul's immortality, as a fact. In the action of both dramas, we repeat, it is shown that there is no earthly greatness that can satisfy man, no human goodness sufficiently positive to content, satiate, or quench this longing of the spirit for the infinite and the

divine. In the consciousness of this fact, the apparent world dwindles and dwarfs itself ; at most it is but a phantasma, a fiction, a fable. In the perusal of *Faust*, we cannot help surrendering ourselves to this conviction, "The things that are seen are temporal, but the things that are not seen are eternal." In the delivery of this lesson, Goethe's hero, like his own conception of Shakspeare's, "is without a plan, but the piece is full of plan ;"—and its plan is that of Providence, in which the sun shines on the evil and the good, and the wheat and tares grow together *until the harvest*. Be it so—this is the mystery of the Creator—this is the mystery of the true poet ; acknowledge it with reverence and in silence : such is the part of the wise reader and the judicious critic.

ART. VI.—*L'Ecole des Journalistes, Comedie en cinq Actes et en Vers*. Par Madame Emile de Girardin. Paris, 1839. (School for Journalists, Comedy in five Acts, and in Verse, by Madame Emile de Girardin.)

DRYDEN has defined a play to be "a drama, a comedy, or tragedy, or *any thing* in which characters are represented by dialogue or action." This generic term may, therefore, not inappropriately be applied to the heterogeneous production before us. In our language we have certainly no specific, fitting and exclusive epithet, for a composition professing to combine the liveliness of the vaudeville and the pleasantry of farce, with the wit of comedy, the pathos of melo-drama and the thrilling interest of tragedy.

The authoress herself, with the greatest sang-froid and apparent self-satisfaction, explains in her preface the plan of her work, which she considers and pronounces to be "novel." In this opinion, at least, she will find the majority of her readers ready to agree. We translate the passage to which we have alluded.

"The plan of this work being somewhat new, the author thinks it right to give some explanation of it. In the first act, *L'Ecole des Journalistes* is a vaudeville, and is sprinkled with pleasantries and puns ; in the second, it is a sort of farce, in which the comic of the subject is exaggerated in imitation of the greatest masters ; in the third act it is a comedy ; in the fourth it is a drama ; and in the fifth it is a tragedy. In the style there is the same variety ; in the first act it is satirical ; in the fourth it is simple and grave ; in the fifth it aims at being poetical. *The author willed that it should be so.*" [L'auteur l'a voulu ainsi.]

However different from other works in this particular, the preface to the "*Ecole*" is by far the most interesting portion. We read it before perusing the work itself and we read it after, for we hoped therein to find the key to what has to us been a mystery : viz. that such a work as the "*Ecole des Journalistes*" should have created the sensation ascribed to it in Paris. Now the value of a sensation in the French Capital, the glory of having created it, is well known to be every thing ; it may not last long, but the delight of it, "till by wide spreading it disperse to naught," is intoxicating.

But to explain the portion of the enigma we have succeeded in unravelling it will be necessary to enter into a few details with regard to the position of the author, and her connection with the press of France. Madame Emile de Girardin is the Delphine Gay, who in early life publicly recited her poems at the Pantheon, and whose stories of "*Le Lorgnon*" and "*M. le Marques de Pontanges*" have been highly applauded in France, and a good deal read in England. By all the periodical writers of the day she was lauded to the skies ; with them she was the Corinna of France, and they vied with each other in praising and encouraging her talents and making them known to the world. The Journalists, therefore, now say that in writing against *them*, as it was they who contributed to her reputation, Madame de Girardin is like an ungrateful child, and that she has taken up arms against the parent that fed, cherished, and honoured her.

There are of course more sides than one to the question. Madame de Girardin pronounces "*école*" to mean "*lesson*." The words school and lesson have certainly a strong link of connection between them in most minds, but we doubt whether the readers of Molière and Casimir De la Vigne, or the lovers of the inimitable "*School for Scandal*," would consent to consider them as synonymous. Supposing, however, the word *école* to mean only a simple lesson to such as may be in a condition to profit by it, and to writers of journals in particular, the instruction, or rather meaning, to be deduced from her work seems to our northern understandings to amount to this :—"Gentlemen journalists, if you continue to write as you have done, see how I will show you up ! It is my intention (*I have willed that it should be so*) men and women shall write, artists paint, and sculptors carve, what they please and how they please, and journalists shall be annihilated. My pen, like the good scimitar of Alraschid, shall cut your swords in pieces."

Leaving it to the journalists of the day,

who have not yet exhibited many symptoms of intimidation, to digest this threat, we return to Madame de Girardin herself. Her great defect consists in drawing no distinction between the clever journalist and the venal scribbler. She has taken a writer who will calumniate for pay or until he is paid, as the type of an enlightening and enlightened class. It is as if she were to offer a Thurtell or a Robespierre as specimens of human nature. In her contemplation of the abuses of journalism, which we admit are flagrant though comparatively few, she has overlooked its uses, which are incalculable and many. She has provoked a spirit of inquiry respecting journalists which leads to their exaltation, and which certainly disparages her work. She has been so unjust to the noblest spirits of her age and country, that it is good to remind her who have been recently, or who are at the present moment, journalists in France.

It is not by such editors as Martel and Pluchard, the two contemptible and degraded beings Madame de Girardin has thought fit to introduce in her "*Ecole*," that the "*Journal des Debats*" or the "*Constitutionnel*" have obtained their European celebrity. Thiers has been the editor of the "*National*" and the "*Constitutionnel*," and he now writes for the latter.* This is less remarkable on the other side of the channel than it would be in England. There has not been for the last twenty years a single minister in France (the ministers of war excepted) who has not been the editor of or writer in a newspaper. The same may be said of every political character of importance and of every literary person of celebrity. Without going back to the days of Mirabeau, Madame Roland, Bailly, Barnave, Lameth, &c. who were all journalists in their day, in the author's own time there have been Benjamin Constant and General Foy. And in the present day there is Chateaubriand, he who has wrestled in journals with apostolic zeal for peace and liberty and faith, and there is Guizot, the author of *L'Histoire des Progrès de la Civilisation* and *Les Mémoires de Washington*, which are only just published, and there is Villemain, the eulogist of Montaigne, Cousin, Mauguin, Barrot, Berryer, the two Bertins, &c. &c. The literary list is not less rich in illustrious names than the political. Alexandre Dumas, Victor Hugo, Balzac, Jules Janin, and a host of others, are all writers

in journals; not to forget Madame Emile de Girardin herself, who, under the name of Le Vicomte de Launay, has long been a contributor to "*La Presse*." In a word, all good writers in France, either have been, are, or will be journalists. It is impossible it can be otherwise; newspapers with our continental neighbours being much more powerful and universal engines than they have yet been with us. Smaller in size, they are more redolent of general interest. In them nations discourse together; the present, past, and future, are all appealed to and discussed. Every thing is revealed to the public. Every body is praised or attacked—often no doubt unjustly and unfairly; but here lies the abuse. This is the alloy that appears to be inevitable in all things earthly, and which amalgamates so much too readily with what would otherwise be the pure and shining ore of human intelligence.

In the columns of a newspaper truth and calumny often walk hand in hand. Malevolence and malignity can there revel at will, and as long as malevolence and malignity exist in the human heart they will revel somewhere,—in the private whisper, if not in the public newspaper,—in the anonymous letter, if not in the libellous paragraph. And let their scene of action be where it may, there will always be some ill-natured, as well as many credulous and innocent, persons to lay the untruth to their souls, and to believe it. And this, not alone from a too willing ear for that which is evil, but from an incapability of comprehending that such envenomed slanders could be invented. Moreover, curiosity is piqued, the imagination awakened and amused, people listen to calumny because they love truth, and the falsehood, when first circulated, gives to the hearer all the pleasure of a discovery. It is, alas! eagerly grasped at, and in nineteen instances out of twenty as eagerly and quickly disseminated.

The press, then, is really guilty of much injustice, of numerous cruelties, and of many crimes; but, on the other hand, it is great, useful, honourable, and beautiful, and enlightens as it spreads. There is a soul of goodness in it that must ultimately prevail. Now, as the encouragers of calumny are not certainly to be found among the most intelligent of mankind, it may rationally be hoped that the evils created or inflicted by the press will eventually by the press be cured.

But to return to the "lesson" intended to be conveyed in the work before us, and to the author's own explanation, which must not certainly be lost sight of. The dramatic personæ are—

* Such, indeed, is the passion of M. Thiers for the vieux métier, that, not content with French journals, he writes in the English. The "*Morning Chronicle*" contains repeated leaders by this minister. How far the *Chronicle* can justify itself on this point to the English public we know not.

Martel, the editor of a journal called "*La Vérité*."

Pluchard, the responsible conductor of the same journal.

Jollivet, Griffant, and Blondin, contributors.

Doricourt, minister of the interior.

Mons. Guilbert, a rich banker; Madame Guilbert, his wife; and Valentine, their daughter, who is also the wife of Doricourt.

Edgar de Norval, a young officer, engaged to a sister of Valentine.

Morin, an artist.

Andrew, his servant.

Cornelia, a dancer, &c. &c.

All these personages do not appear in the first act, which, it is to be remembered, is a vaudeville. Martel, Pluchard, and the contributors, are introduced, and a wretched set they are. All of them, "Men who go about to cozen for une, and be honourable, without the stamp of merit." Martel, however, shines supreme among them in baseness and dishonour. M. Guilbert and Edgar de Norval are also seen in the first act, and the name of Morin (of whom more hereafter) is frequently mentioned. To render Pluchard, and his respectable coadjutors, more interesting, they come on the stage in a state of intoxication. In this condition the proof sheets are distributed to them by Martel, and the "pleasantries" promised by the author seem to arise from the errors of the press. *Empereur* is misprinted *Empirique*, and *Autriche*, *Autruche*. The first number is however pronounced to be a model. Immense success is prognosticated by Martel, who is afterwards fetched to his wretched home by the unworthy and degraded Cornelia. Such a woman, Madame de Girardin ought scarcely, we think, to have introduced at all. The act then closes with the following soliloquy by Edgar. As he pronounces it he is gazing on Martel, who has just quitted him.

"This then is the power known by the name of journal! Collective loyalty and absolute tribunal! A judge without talent, a fabricator of irony, who kills a man of genius with words. A pampered epicure who battens on death. A madman, who sets Europe on fire, and resigns himself to sleep. A would-be poet, a great soul sunk in idleness, who, without love, is the slave of a dancer! These people are all destitute of good faith, and betray one another. And such are thy guides, O my poor country!"

Poor indeed! if such men as Martel do guide it, and poorer still if men like Martel are placed among its "great souls!" Of what materials can the base by possibility be made?

It need hardly be remarked that the incidents in the first act are neither startling nor numerous, or that the dearth of interest in spite of the "pleasantries" is extreme. The scenes however must not be regarded as passages that lead to nothing, for they do

lead to a great deal of absurd reasoning and morbid pathos. Edgar's speeches being always in perfect harmony with the preface, he may fairly be considered as the mouth-piece of the author. The inference to be drawn from his melancholy forebodings is nothing less than that France, "*la belle France*," is on the eve of being packed up in a newspaper and sent out of Europe!

But proceed we to act the second, the farce of the author. The estimable Martel is here seen in his *bureau*, which is represented in most admired disorder. He congratulates himself on the absence of the worthy Cornelia, who is at the theatre practising a step. He elegantly abbreviates her name to "*Nelie*," (oh! mother of the Gracchi, what wholesale profanation) and proceeds to apostrophise her in the following strain of affectionate sentiment: "*Nymph! I idolize thee; but I like to know thee happy far from me*," (he likes her best at a distance; considering the sort of person "*Nelie*" is, this is very natural.) "*My greatest pleasure is to think of thee.*"

The happiness of thinking of *Nelie*, we are sorry to say, does not last long. She returns unexpectedly, and seems only to return to expose in every possible way the weakness of Martel. She has been called the antique Cornelia in Martel's own journal, "*La Vérité*," and is excessively angry and violent in consequence. He appeases her by the most absurd flatteries. Restored to good humour, she seeks to obtain a new muff at his hands; but he, not being *en fonds*, endeavours to persuade her that her velvet shawl will very well supply its place, that buds moreover are bursting, and lilacs coming forth, in short that summer is at hand, and muffs useless. "*Nelie*" however perseveres in her demand till the arrival of Mons. Guilbert obliges her to quit the bureau. The rich banker comes to complain of an article in "*La Vérité*" which has occasioned a loss to him of twelve thousand pounds. Martel promises the reparation of a contradictory article on the following day, and assures him that "*a good journal is a docile courser, which when well mounted can go everywhere*," meaning, we presume, that it will stop at nothing. Mons. Guilbert is not, however, to be pacified. The return of "*Nelie*" to the bureau reveals to the banker Martel's way of life. He reproaches him with it, and his reproaches are overheard by the angry Cornelia. On the departure of Guilbert she searches among Martel's papers for an article formerly written by himself, and calumniating the wife of Guilbert. Martel at first rejects the idea of publishing it, because it will give pain to Valentine, the

daughter of Madame Guilbert, but a few persuasive words from the fascinating Cornelia decide the question, and the article, base and cruel as he knows it to be, is dispatched for publication. A scene subsequently takes place between Martel, Pluchard, and Andrew, the servant of Morin. The injuries of Morin are herein again discussed, and the last scene of this strange eventful second act consists of clamorous demands from all sorts of people for patronage, and "honourable mention" in Martel's journal. We have been thus minute in the analysis of this act, because we wished to show how very comical it is! The censor has unquestionably secured the Parisian public from the saddest of all attempts at fun. He has in our opinion been most discreet in rejecting this wholesale charge against the press without either wit, elegance, or truth.

The third, fourth, and fifth acts might be condensed and reviewed together; for although all founded, as we think, on mistaken principles, they are not entirely destitute of interest. We will, however, take them separately. It is to be regretted, for the author's sake, that she did not boldly plunge into the midst of things, and commence with the third act. For although her work would still have been untenable in principle and faulty in execution, it would not have been the discredit to her that it now is. She would have saved us from the odious Martel, and have spared herself a humiliating lesson. The two first acts of "*L'Ecole des Journalistes*" must, we think, have practically taught Madame de Girardin that what is utterly base and vile creates neither mirth, laughter, nor interest. Had she wished to establish the truth of Pope's couplet,

"Vice is a creature of such hideous mien
As to be hated needs but to be seen,"

she could have hardly chosen a more fitting illustration than the unprincipled Cornelia, a woman, destitute of understanding and feeling, solely occupied by her own miserable avarice and despicable vanity, not even possessing the redeeming trait of affection for the being she impoverishes and degrades.

We are now introduced to Madame Guilbert, her daughter Valentine, and to the artist Morin. Edgar de Norval continues his ceaseless and senseless philippics against journalists and journalism, and in the meantime remains the bosom friend of the profligate Martel.

Morin complains to Valentine that after *forty* years of success he is neglected, that the minister, the chamber of deputies, king, lords and commons, in short, are all guided

by the oracular voices of the journals; that those voices have been raised against him, and that he and his talent have been sacrificed (after forty years of success!) to their fury. Valentine kindly sympathises with M. Morin. We wish we could do as much. But we really feel that any human being, who can boast of forty years of success in any line, should have his heart overflowing with gratitude to God, and benevolence and kindly feeling to his fellow men. His mouth should be filled with thanksgivings, and not with upbraidings, and his thoughts should be thoughts of peace. Out upon the diseased sensibility that would make M. Morin's a case deserving of general sympathy. The circumstance of this character being taken from real life, does not in any degree alter our view of it. M. Gros, whose whole history under the name of Morin, has been but too faithfully given by Madame de Girardin, did complain, and most unjustly, of the journals. In the days of the empire he painted fine historical pictures, among others, "*Napoleon at Eylau*," just engraved in this country by Lucas. From the French nation he received not only the artist's best and dearest guerdon, fame, but the wealth of a prince, together with the consideration and honour due to his genius. He numbered more years of success than Raphael did of life, and then, (with grief do we record it,) because a young and ingenious competitor was preferred before him, committed suicide. Regret at this act all feel, and none would envy those who contribute to working up this state of sensation; but let us not be told he was a victim to any thing but the errors of his own mind—to overweening and most ungenerous pride—to an ambition that was ill-starred, because it was ill-woven. The trumpet of fame had sounded too loudly in his ears, and it had stunned him. He was a child of genius spoiled by the adulations of the world.

The most sensible sentences in this play are decidedly those uttered by Valentine in arming others against newspaper paragraphs. We are therefore the more sorry for her, when we find her philosophy no coat of mail to the arrows of "*La Verité*," when aimed against herself.

She says to Morin—

"What! Do you fear them? as for me, I own
I gaily brave their formidable power.
The power of journals is perhaps injurious;
Despising, we escape its influence."

But when Valentine reads an article in "*La Verité*," entitled "*The Minister and the Lover, or the Mother and Daughter*," and finds it applicable to herself, she is overwhelmed with most natural sorrow.

The name of Lorville is substituted for that of Gilbert, and the history of Valentine's mother given nearly as follows. Madame Gilbert is represented as having been passionately attached to a man of talent, and of having aided his advancement in life. But one day a billet-doux, intended for herself, falling into the hands of her husband, his suspicions are aroused. "He goes to sleep uneasy and wakens jealous," and feels it necessary, for the tranquillity of his mind, to banish his suspicions or his wife. The wife, however, extricates herself from the difficulty by asserting that the billet-doux was from a party in love with their daughter, and begs her husband to accord his consent to her union with him. The credulous husband is of course satisfied. The lover of the guilty lady becomes the husband of her daughter, and the calumnious article concludes by stating that the parties all live happily together, the charmed world granting its affection to the happy trio.

Valentine recognizes at once her husband and mother as the parties designated, and indignantly exclaims, "Oh the wicked statement." She repels the accusation as a shameful untruth, and is angry with herself for noticing it at all. But by slow degrees, circumstances come back to her memory which make her believe that her husband was indeed the lover of her mother, and that she has been their unsuspecting victim. The person to whom she reveals what she has read, is of course Edgar de Norval. She begs of him to hasten his marriage with her sister, and to permit her to accompany him and his bride when they go away, in order that her dreadful despair may not have any witnesses. It is impossible not to sympathise with the affliction of the gentle and amiable Valentine, but the following scene, strange indeed to English heads and hearts, happily sets all to rights again. The mother confesses to her daughter that she did love the man who is her son-in-law.

Madame Gilbert.

What ! have I wronged thee, Valentine, in aught ?

Valentine.

They who have no remorse, are in their own eyes Ever innocent.

Madame Gilbert.

If I have made thee suffer, now complain,
There must be no reserve with me, my child,
Why dost thou tremble, and become thus pale ?
Speak, for this coldness—

Valentine.

—Indicates respect.

I dare not give my griefs to utterance ;
Oh ! do not force me to disclose my wrongs.

Madame Gilbert.

I can no longer bear suspense like this ;
I ask, and I expect an explanation.
Whence this despair, and why these bitter words ?

Valentine.

It was you, my mother, who united me
To your own lover. You it was, who formed
This odious tie.

Madame Gilbert.

Listen to me, my child.

Valentine.

No ; I hear nothing.

Madame Gilbert.

It is submission that your mother claims.

Valentine.

Madam, I feel myself no more your child.

Madame Gilbert.

Malice has done its worst ; poor child, be calm.

Valentine.

Farewell ! I go ; be happy without me.
You love my husband—I restore him to you.

Madame Gilbert.

Come—

Valentine.

No ! I see thee but as his mistress.

Madame Gilbert.

How can I tear this error from her heart ?
But courage ! Let her rage exhaust itself,
She would hear nothing now.

Valentine.

O misery !

To be heart-stricken by a hand so dear ;
To find betrayal in maternal arms ;
A mother's hand to bless the guilty tie,
Dishonouring her child ! Stifling in her soul
Her filial duty and her woman's love :
Deliv'ring her to vows, and dark suspicions ;—
Blasting in one day all her days, and that
At twenty ! And a mother, of her children
The pride and honour ! Ah, 'tis infamous.

Madame Gilbert.

But happily, my child, such things are not.
Now listen ; it is time, and it must be ;
The pain of this confession matters not.
I see thee dogged by horrible suspicions,
I must betray the secret of my life,
'Tis true, I loved thy husband.

Valentine.

Well :

Madame Gilbert.

In spite

Of all my efforts—

Valentine.

Madam, this I know.

Madame Gilbert.

But he ! he knows it not ! he ne'er hath read
My wounded soul, nor known my guilty thoughts.
And this avowal of my love, which stifles
Utterance,—I confess to thee alone.

I struggled long to overcome my weakness,
 Yet his fine talents and his noble heart,
 Those greatest gifts which every where are felt,
 Attracted, charmed, and hurried me along ;
 Of him I would have claimed assistance,
 Mad hope ! for which I cruelly was punished.
 His mind was tranquilliz'd by grave pursuits,
 While my poor heart, by every new success
 Of his, was agitated more and more.
 Alas ! it was imprudent, now I feel it ;
 How dangerous is it to admire and love !
 I struggled vainly 'gainst a fatal passion,
 And should have fallen. But one night at a ball
 He saw thee, Valentine, and I was saved.
 Yes, from that moment thou alone hast pleased
 him.

Well, so I love thee it does not afflict me.
 His cares for thee caused me nor grief nor anger ;
 I pardoned thee, my child, for pleasing him,
 Did justice to myself, and giving pride
 Another channel, placed the whole of mine
 In thy young beauty ; Yes ! I felt with gladness
 That in my innocent soul maternal fondness
 Was far the strongest passion ; then I taught thee,
 Day after day I taught thee, how to love him :
 And in thy growing love my heart grew pure.
 And in a year, when thou becam'st his bride,
 If then my tears were seen, or I seemed jealous,
 'Twas not of thee with him ; but oh ! of him
 With thee ; for then, my child, I felt and feared
 That in thy heart my place was gone.

Valentine.

Oh mother !

Madame Guilbert.

My conduct has been publicly condemned.
 As long as thou wert ignorant of all
 I've now revealed, I willingly supported
 Outcries against me ; but the time is come
 To justify my outraged honour.

Valentine.

Struggles like these, which tower above our race,
 Look lofty to mankind, and are as crime.
 The world is soon alarmed by sentiments
 Thus noble. It sees in their excess deep perils
 It cannot comprehend and yet condemns.

Madame Guilbert.

But come, my child,—come to thy mother's arms.

Valentine—falling on her knees (she sobs).

No ! at your knees, mamma ! forgive me.

Madame Guilbert.

Nay ;

These horrible suspicions were not thine."

The scene closes by Valentine's telling her mother she derived her information from a journal, and declaring that she will never read another as long as she lives.

We do not ask our readers to imagine such a scene as the foregoing between an English matron and her youthful daughter ; we know it would be asking the impossible. The whole affair is inconsistent, unnatural, and preposterous. We are ourselves of that portion of the world, that neither approves nor comprehends sentiments so inordinately fine as to savour of crime and immorality. Mothers, who by gentle precepts and amiable example, train their daughters to be good wives, and in their turn good mothers also, are preferable in our eyes to tragedy heroines, who sacrifice their lovers

to the happiness of their children, by converting them into sons-in-law.

The entire scene is given to show the extreme materials Madame de Girardin has chosen to make out her case against the journalists in the melo-dramatic part of her performance. In what way she justifies to herself the having raked up an old and painful calumny really promulgated in Paris against one of the most intelligent and courageous of the supporters of the press, we cannot divine. If the press would have been to blame for publishing such a slander, is Madame de Girardin herself quite blameless for having sought to give the same slander dramatic celebrity ? The lady cannot but be aware, that every body at all acquainted with the gossip of Paris, will without difficulty be able to give real names to the mother, daughter, and lover. Has she done wisely or well in reviving to these deeply injured individuals the remembrance of their wrongs ? If she intended to take their part, the interference was uncalled for and unnecessary, the parties themselves having adopted the only dignified and high-minded course in such cases—they have lived down the calumny.

The man against whom this domestic persecution was levelled knows that the popular voice is the most uncertain of all things ; changeful as the chameleon or the weather. The insults, injuries, sarcasms, and fury of the press, are to him what the blows of the battle-axe and the thunder of artillery are to the military hero. He knows they are the result of his position, and that they must be braved and borne. Amid the clash of parties, his soul has remained serene, and we do not think he can feel very much obliged to the author for reminding the world of what he has endeavoured to forget, or showing where and how he has been wounded. There is, however, another view to be taken of even such a heartless and heart-rending calumny as has been cited. But at this side of the question Madame de Girardin never even glances. She sees the evil of a slanderous invention, but her vision does not extend to the beneficial effects resulting from a published truth.

In the fifth act (the poetical and tragedy act) the catastrophe of Morin's death takes place. Andrew, Morin's servant, reads in "La Verité" an eulogium on his master, and in order that Morin may be sure to see it, places the newspaper on a box of colours in the painting-room. But Morin has previously resolved on dying, and dispatches Andrew with a note to Edgar de Norval, apprising him of his intention. We do not know how Edgar de Norval managed it,

but he seems to have been equally the friend of injurer and injured, that is, of journalists and their victims. The following are a few passages from the final soliloquy of Morin :

"'Tis art alone that gives the artist life.
Well ! when his art is lost, the artist dies !
All now is o'er ; this work, so beautiful,
Which was *my due*, is given to another.
A kindly hand in vain protected me,
The blow was not to be avoided.
My enemy succeeds, and hope is gone.

(*Morin perceives the Journal which is lying on the box of colours.*)

The paper here again ! I'll see't no more.
(*He tears the paper to pieces, and throws the fragments far from him.*)

It is my rival, chief of the new school,
'Tis Jardy who will paint the cupola,
And I have nothing ! My name is contemned.
Is this then the reward of all my labours ?
Then, is there no enduring triumph here,
If the mad judgment of a wretched few
Can forty years of bright success destroy
In one brief day ! And such success !

* * * * *

* * * * *
Alas ! how blest I was,
When, after a great victory, the emperor
Selected me to chronicle its issue,
And said to me, before my jealous rivals,
'Ah ! Morin, we've been labouring for you.'
Those words still linger in my flattered ear ;
And what ! Are such success and such renown
Destroyed for ever, and by senseless fools,
Who sell at random wordy insolence,
And make unto themselves a livelihood
Out of my glory ? Because I am old,
They strike at me without or fear or danger,
Nor have I sons to vindicate their sire.

(*He walks about the painting-room and contemplates his pictures.*)

My pictures ! witnesses of my dark woe,
Receive my last adieu ! Hope of my name ;
Oh ! may that name by you become restored,
And death commend me to posterity.

(*He opens a strong box filled with newspapers, which he unfolds ; he then puts a copy-book, sealed with black, into the box.*)

Upon this heap of injuries I place
My will ; of my long tortures it contains
The fatal history. The poison known
That ate away my life, I shall be pardoned
For shortening its course. Now in my fall
To-day I feel 'twas criminal to have
An idol in the world. Guilty I was
In this ; my youth e'en to impiety
Carried the love of art. To portray well
Upon my canvass light or shade, the sea
To swell, or bid the sails of ships to tremble,
To paint a look, a smile, or lightning's flash,
I would have sold my spirit to the damned.
My art—it was my life !—had all my dreams.
I loved my children less than those I taught.
Two days I wept for buried friends, no more ;
But my ungrateful pupils weep I still.
Faithful in all my sentiments to art,
Woman to me was only as a model.
Beauty the only virtue that I prized,
I asked of woman neither truth nor love.
I gazed upon her joy with eye profane,
And calmly traced her fine pellucid tear !
I was a painter ever : without fear,

Without remorse, I loved to question Death
On all his darkest secrets. Yea, with God
I wrestled. Nature's Author was to my
Distorted pride only in art a rival !
Aye, jealous of his glory, I reproached him
With his sunbeam on which I could not seize.
But God has punished me, and most severely ;
For having lived by pride, I die by shame !
(*He goes out, concealing his face with both his hands.*
Valentine at the same moment appears at the top of the stair-case.)

We stop not to remark on the disordered sensibility or extreme selfishness exhibited in many of these sentences. But we should really like to know to which of Morin's errors Madame de Girardin attached herself the most, or which she thought the most deserving of the sympathy and admiration of the world. Was it the self-idolatry and hood-winkedness which prevented him in his old age from seeing any thing in this beautiful world save himself and his own pictures ? Or the heartlessness which he avows, and which made him incapable, and, we think, unworthy, of either love or friendship ? Or was it his utter want of commiseration with all other votaries for fame ? Or his insensibility to the splendid beauties of nature, except as far as he could copy them ? Or his entire want of all pious feeling and gratitude to God ?

It has before been stated, that Morin is intended as an impersonation of M. Gros. The only difference in the real destiny of the artist and the imagined history of M. Morin, being in the manner of their deaths. Monsieur Gros, we believe, threw himself into a horse-pond. Madame de Girardin alters this fact, and makes Morin throw himself from a window. In this she has shown some taste, the one mode being certainly a degree more dignified and less disagreeable than the other.

The Parisians said of M. Gros, when he persisted in exhibiting pictures without a vestige of his former genius, "C'est dommage," the journalists echoed the public, and repeated "C'est dommage." We in our turn re-echo the journalists, and re-repeat again and again, "C'est dommage." It was a pity that M. Gros did not know how to submit to growing old ; for that appears to have been the only evil he had to bear. It is a pity, too, that Madame de Girardin has thought fit to tread so heavily on the ashes of the dead, and remind the world that although M. Gros, from his excellence in art, and his love of it, deserved a niche in the temple of Fame, he was morally undeserving of the concomitant blessings showered on him by his country. It is a pity, too (but this is to mingle the ludicrous with seriousness,) that Madame de Girardin should make Morin choose so inopportune a mo-

ment for putting himself to death. Valentine really deserved better at his hands than that he should destroy himself at the precise moment he had fixed for taking her portrait.

Valentine, when she comes in, is followed by her mother, and subsequently by Andrew. In a short time it becomes known that Morin has committed suicide. Edgar de Norval and the journalists all arrive, the former to join in the lamentations of Madame Guilbert and her daughter, and the latter to be reproached as his murderers—with how much truth, we leave the reader to decide. Martel, too, turns most unfairly against his former allies, and informs the spectators if it had not been for journals he should have been a poet! He does not inform us how much criticism it requires to destroy the poetic faculty, which we regret, for the knowledge might have been useful. We might, perhaps, have thereby discovered what portion of animadversion would prevent Madame de Girardin from writing another "Lesson to Journalists." Neither does Martel explain if it were by a critical process he had been rendered the poor and contemptible thing he was. For, let it be remembered, that Martel was not only *not* a poet, but an exceedingly base and bad man.

This highly consistent and very interesting play terminates by Valentine declaring she loves her mother better than ever, and by Edgar de Norval taking on himself the editorship of "*La Verité*," which Martel gives up. He descends into the arena, and makes himself the accomplice of journalists, in order to conquer them. He knows he shall be sacrificed, and that in offering himself as an example, he must become a victim; but, like another Curtius, he generously throws himself into the gulf before him, and trusts that his grateful country will one day bless his misfortunes, and comprehend his love!

Edgar de Norval is, therefore, most likely intended as the representative of Monsieur Emile de Girardin, the husband of the authoress, and who is the editor of "*La Presse*" newspaper in Paris. In this fact, in all probability, is to be found the history of the writer's bitterness against the journalists of France, the same whip that lashed her hero "Martel" out of poetry having lashed her husband into editorship. M. Emile de Girardin had the great misfortune about two years ago to kill, in a duel, Armand Carrel, one of the leading political writers of his day. Respected by all parties and greatly beloved by his friends, the journalists of the same political opinions as himself made his death the subject of bitter invectives against the adversary who had deprived him

of life. The circumstances of M. de Girardin's life which would least bear inspection were dragged to light. Private pique possibly, therefore, instigated the tirade of Madame de Girardin against journalism.

M. Jules Janin has published in the "*Artiste*" a most courteous, generous, and gentlemanlike letter on the subject of this play. Nothing can exceed the beauty of his defence of the Parisian press. We feel for Madame de Girardin while we read it. He upbraids her so forcibly, but praises her so nobly and so delicately, that we think some compunction must have visited her heart when she read it. M. Janin has certainly overrated the literary merit of her work, but this gentleness of judgment under the circumstances reflects infinite honour on his gallantry and generosity.

For ourselves, after the best attention we could give to Madame de Girardin's work, and a fair consideration of all the known and conjectured facts on which it is founded, we reluctantly pronounce it inadequate either to the cure or exposure of the evils of the press. Its whole style of sentiment stilted and unnatural. The subject, in itself incapable of dramatic action, feebly drawn, poor in outline, with no depth either of reason or argument to compensate for the want of wit, and the utter dearth of morality. The only virtuous man victimized in futurity, and the impersonation of talent in Morin accompanied by such disgusting immorality, profaneness, and heartlessness, that if journals push such men from our path, we have to bless their action with the same degree of warmth with which men hail the blast of the desert or the convulsions of the Andes as purifying the physical, and not involving them in the process.

In propitiation of this mighty power thus recklessly braved by Madame de Girardin, and with the intention of indicating the nobility as strongly at least as this lady has attempted to show the degradation, we subjoin the following lines on the Press by the late Rev. T. Greenwood, B. A., Trinity College, Cambridge. We trust that time will develop more golden arrows from the same glorious quiver, which have long lain in repose since the gifted writer passed to God.

"The Press! the venerated Press!

Freedom's impenetrable shield;

The sword that wins her best success,

The only sword that man should wield.

Deign, Britain's guardian, still to bless

Our isle with an unfettered Press.

"Unfetter'd! Who or what shall bind?

No chains a tyrant could devise:

This essence of immortal mind

Rends, Samson-like, their feeble ties;

Springs with fresh vigour to the fight,
And puts forth thrice its former might !

"Fetter the Press ! Attempt to throw
A bridle o'er the roving breeze :
Instruct it at your will to blow ;
Impose restrictions on the seas.
Dotards ! as soon shall these obey,
As the Press crouch beneath your sway.

"Look to the past ! When despots bade,
As Canute once, the waves retire ;
If for a moment they were stay'd,
'Twas but to mock, not shun such ire,
Daring to wait the stern rebound,
Power has been crush'd and grandeur drown'd.

"Look to the future ! What has been,
Instructs us what is yet to be ;
A pause but seems to intervene—
The Press is by its nature free ;
And every effort to enslave,
Courts but the overwhelming wave !

"'Twill come, 'twill come,—that ample tide,
Which o'er the delug'd earth shall roll :
A sea of knowledge deep and wide,
Impetuous if it meet control.
Genius shall to the flood allure,
And science keep the waters pure.

"While all that hate shall melt away,
Like clouds before the morning sun,
Preparing through a summer's day.
His course in god-like pomp to run.
Error shall quit each happy shore,
And ignorance be known no more !

"The Press ! the glorious Press ! to her,
The herald of that age divine,
I turn, her humblest worshipper,
And lay this offering on her shrine.
O ! would she but extend to me
Her boon of immortality !"

ART. VII.—*Vermischte Schriften, grösstentheils Apologetischen Inhalts*, von A. Tholuck, Dr. der Theologie und Philosophie, Konsistorialrath und ordentl. Professor der Theologie an der Königl. Universität Halle, Wittemberg, &c. &c. (Miscellaneous Writings, principally in Defence of Religion, by A. Tholuck, Dr. of Theology and Philosophy, Counsellor of the Consistory, and Professor of Theology in the Royal University of Halle, Wittemberg, &c. &c.) Hamburg, 1839.

THERE are few subjects upon which more ingenious remarks have been made, more curiosity excited, and more real ignorance displayed, than the religious phenomena of the intellectual but visionary people to whom Europe is indebted for so many interesting discoveries in science, history and philosophy, to which also it must refer so many pernicious

sophistries and specious delusions. When the barrier was first removed which the ungenerous policy of Napoleon had for many years interposed between Germany and our own country, many bright hopes were kindled in the spirits of enthusiastic students in England, dissatisfied as they necessarily felt with the cold, superficial philosophy taught in our universities, and struggling with impotent effort against the formal dogmatism of the theologians of the last century. The cloudy genius of Coleridge found in the strange atmosphere of German mysticism congenial nutriment, and reflected in distorted splendour rays of most attractive but mysterious brilliancy. Nor did the minds of other great writers, such as Scott and Wordsworth, escape the fascination. With regard to the effects in other departments of literature, much valuable information has been communicated in the pages of this Review, and in the writings of Carlisle and others ; but the theology of Germany has been as yet but partially and incompletely investigated ; although the very audacity of its attempt, the singular varieties of its productions, and the immense reputation of its professors for erudition and ingenuity, ought to have engaged more philosophic and candid minds in a work that well repays the labours of research. English writers on the subject have either fallen into the snare of disguised infidelity, and translated and disseminated by their personal influence some of the most dangerous works which prepared its way, or have been impeded by a bigotted adherence to mere external forms in their attempts to analyze the productions, and appreciate the real tendency, of the theological writings of Germany. Neology in the mean time has made most alarming advances. Originating, as we shall presently show, in the study of English free-thinkers and Socinians, it soon assumed a very different aspect, and attained to a more systematic development in the works of the learned Germans, and when reimported into the country of its real birth it was regarded as a stranger, and dreaded as an unknown and most perilous foe. To give a concise but comprehensive view of its early origin, the causes that prepared its success, its gradual and continual development and present extent, will be the principal object of this article ; the materials being principally drawn from a dissertation in the second volume of Tholuck's Miscellaneous Writings.

But we have first a few remarks to make, which we trust will not be uninteresting, upon the position which the learned and pious author occupies among the polemical

writers of the present epoch, and the circumstances under which he commenced his honourable career.

When we had terminated our youthful studies in the noble university, to which its scions are indebted for so much unmingled good, we well remember the intense interest with which we looked towards the kindred Saxon nation—kindred in blood, in manners, to a considerable degree in intellect, and, above all, in religious faith. Forewarned of danger we certainly were, but could hardly believe that the countrymen of Luther, the descendants of the pious reformers, had utterly abandoned the faith of their true-hearted ancestors. We conceived it indeed possible that ritual observances and Church establishments had been partly remodelled and partly abolished, nor in our youthful presumption were we fully aware of the importance of these outposts of the faith, but we could not be induced to believe that the internal spirit had departed. We expected to meet with much vague mysticism, visionary systems, and presumptuous speculations, upon subjects above the reach of human understanding, but still we trusted that far beneath the stormy agitations of the upper waters a mighty under-current of true religious faith was pursuing its onward course, and would finally prevail. With these feelings we visited the schools of Germany,—and what was the result of our observations? Most embarrassing certainly. full of anxious doubt, of fear, at times of despondency, yet not altogether uncheered by rays of hope. Whether that hope was itself a delusion, a mere subjective feeling, derived not from the real aspect of the world, but from principles of faith grafted early in the heart of a Churchman, and intertwined with his very existence—a feeling that casts the hues of its own brightness over the emptiness and falsehoods of a society which is entirely sunk in materialism or practical infidelity,—these are questions which can hardly yet be clearly answered, since the solution depends in a great degree upon the future. When we were in Germany we heard Deism taught openly in the theological schools. De Wette's *Einleitung*—a work which utterly repudiates all miraculous agency, and treats believers in it with condescending pity as unenlightened, or with sarcastic derision as bigotted or hypocritical, was actually the text-book for theological students in the first university we visited.

In the lectures of the celebrated Arabic professor, who condescended to shed some of his illumination upon the strange legends and wild poetry of an inferior branch of the Semitic race, remarkable in a psycholo-

gical point of view principally for their aberrations from common sense, for their absurd credulity, and extraordinary delusions—for such was the light in which the admirer of the Koran and Hariri regarded the books of Holy Writ, we heard all prophecy denied, explained away, or rejected as spurious. We can hardly refrain from smiling when we recall the scared astonishment with which two or three English students first listened to the professor's interpretation and commentary upon the second psalm, which he unhesitatingly referred to the age of Cyrus. We can look back with quiet wonder to the scene, although our conviction received a rude shock by such an assertion, made unostentatiously, and as a demonstrated fact, by one esteemed for his moral character, and respected for his extensive learning—for we fortunately did find out at length that this, with thousands of similar so-called discoveries, was a baseless hypothesis, and returned, smarting indeed and nearly exhausted by the mental struggle, to the pure faith of the Church. Such, we fear, was not the case with all; such wounds rankle long in the heart, and unless there be within a well-founded healthy conviction, powerful enough to resist and throw off the poison, it spreads rapidly through the intellectual frame, and produces the worst of deaths—the death of the spirit.

In the pulpits of Germany what were the doctrines expounded? The preachers in the universities were for the most part men of extraordinary learning, very eloquent orators, remarkable for the ingenuity of their evasive interpretation, and for a rich flow of attractive and commanding language; but their doctrines were a mere nominal Christianity, for although with unblushing effrontery they continually spoke of the sacred truths of vital religion, and made copious use of the well-known symbols of faith, they evidently attached to them a signification entirely different from the real. Yet with all these just causes for despondency we could not quite despair of the nation—we saw that, as in the days of Hilary of Poitiers, the hearts of the people were purer than the minds of the priests—we found, very rarely indeed, but yet we did find some noble spirits among the studious youth who had not bowed the knee to Baal. We met in our frequent wanderings through the villages and country towns with many a pious and simple-hearted pastor, who, though unable to compete with the haughty antagonists of faith in erudition and dialectic subtlety, yet clung with undivided allegiance to the truth, of which he felt an inward assurance, unassailable by the keen weapons of world-

ly sophistries. We found the honest and well-taught peasantry thronging the house of God, wherever a faithful minister declared with earnestness and simplicity the undiluted truths of the Gospel, and deserting that house when desecrated by unbelief or falsehood, however speciously disguised. With these facts—facts which could not be denied, though most distasteful to the prevailing faction of the times—before our eyes, we felt warranted in looking forward with confidence to the final issue:—in hoping that the re-awakened spirit of Germany would at length cast off its disgraceful fetters; that learning, followed out to its legitimate results, would strengthen and confirm the historical proofs of revelation; that with equal abilities, equal learning, equal skill in the employment of logical weapons, some lofty spirit would at length arise to emulate the glory of a Leibnitz, a Pascal, and our own Paley, Butler, and Chalmers, in the triumphant vindication of religious faith. Such even at that dark epoch did we believe would be the case, and waited with unwearied expectation for the appearance of a knight of the Cross. That expectation is now to a certain extent fulfilled. Trained in the rationalists' school, intimately acquainted with all its winding and subtle arts of delusion, Tholuck, Olshausen, Storr, Knapp, and Hengstenburg, with a few kindred souls, have reassumed the helm and hauberk's twisted mail, the impenetrable shield, the keen weapons of Christian faith. The conflict between them and the party of infidelity is even now in its mid-career; some indeed of the hoary enemies of Christ have deserted in time the standard of rebellion, but we have strong grounds to believe in appearance only; yet many, blinded by their unspiritual fanaticism, (for it is a most absurd mistake, if not a voluntary lie, to assert that fanaticism is the product of religious error solely or principally,) many, like the foul libeller whose so-called 'Life of Jesus' met with a well-merited castigation in this work, have dared a last charge, and the little band of the faithful are even now contending against a numerous host of desperate and unscrupulous foes. May England send across the seas the loud voice of grateful sympathy, and cheer them in their honourable warfare. For should those witnesses be silenced,—should the merited doom of total spiritual darkness fall upon that almost apostate nation, fearful would be the consequences, not only to Germany, but, as we firmly believe, to our Church and nation. The establishment of irreligion in that land, save where Romanism might prevail, stifling all thought, and enveloping the conscience in meshes far more artfully woven than in

the old days of ignorant credulity, would certainly tend greatly to encourage the endeavours, and forward the success of the self-called Socialists in England.

We cannot help believing, although we know how bigotted and narrow-minded our feelings must appear to those who purchase at an easy rate the praise of enlightened liberality by the toleration of vice, who recommend patience when the ship is burning, and bid us look on quietly while the lighted match is falling in the magazine beneath us—we cannot help believing that at present there is great danger here, and on the continent, on the one hand, of spiritual tyranny, not the less formidable because separated for a space from the civil power; on the other, of abominable vice based upon atheism, for never, since the days of Protagoras and the Athenian sophists, have the principles of licentiousness and crime assumed so formidable an aspect,—been so consistently and systematically developed. Yet, great as is the danger, we say again, we look forward with confident hope to the result. If the wise and good in all nations will combine their efforts,—if all who hold the fundamental truths of vital religion will act in communion, in the spirit of charity and love, and,—disregarding all minor points in matters of discipline, and even doctrine, if not unquestionably pernicious as well as false, look always and only to the principal duty and highest privilege of a Christian—the maintenance and defence of religious faith.

Augustus Tholuck is an author of no ordinary calibre; he is already known, and most advantageously, to theological students in England and America, for his able Commentaries upon the Epistles to the Romans and Hebrews, of which great use has been made by Professor Stuart of Andover, and although some opinions require to be modified (for we could hardly expect that a mind, however vigorous, could at once throw off the shackles of early prejudice), we believe that a translation of those works would be very acceptable to the English reader. He has also published a most important work on the Credibility of the Evangelical History, in which he has refuted the sophistries, and exposed the misstatements of Strauss, in almost every detail—a work of which we do not hesitate to assert that, for fairness of exposition, profound learning, critical acumen, and above all, for a sound healthy spirit, it rivals or excels any composition of a similar character produced in Europe for many years. We regret deeply that the *Life of Jesus* by Strauss has been translated into French, and thus rendered accessible to many of our countrymen, who are less

qualified by their education to detect the falsehoods and guard against "the rhetoric that hath so well been taught its dazzling fence," than the young men for the most part of learned and highly-cultivated minds, who are enabled by their knowledge of the German to appreciate the original work. This being the case, we are inclined to think that a translation of Tholuck's refutation of Strauss ought to be written by some of our young theologians; and if, as is too probable, pecuniary difficulties impeded the publication, we think that one of the universities would be willing to undertake it. It is no doubt very advantageous to our Church, to explain, comment upon, and familiarize the English reader with the productions of Tertullian, Cyprian, and other fathers of the primitive Church, and we entertain a very low opinion of the intellect of those who dream that Popery is taught by the records of early Christianity. Oxford then does well to bestow much learning and assiduous labour upon the long-neglected study of ecclesiastical antiquities—but we hardly believe that they meet the most pressing danger of the day. Judging, as far as we can, from our own experience of the influences at work among our collegiate youth, we should be inclined to think that a sound, candid, and thoroughly learned treatise upon the same subject as that which Strauss has so shamefully perverted, would just now be exceedingly desirable. If such a work be not soon produced—and it is not the work of a day, it would require long and patient inquiry, guided by critical discernment and enlightened zeal—in the meantime a good translation of this work of Tholuck's would be a blessing to our country; it would recall many, it would preserve more, from very dangerous error.

The contents of the two volumes whose title stands at the head of the present article are peculiarly interesting. As the title indicates, they are generally apologetic, rescuing with ingenious and learned criticism some very important passages and doctrines from their enemies, clearing up the difficulties of geology, and the objections founded upon the variety and dissonance of languages, the contradictions of pagan records, and the discoveries of science which have sometimes with sincerity, but more frequently with malignant satisfaction, been brought to bear against the Mosaic account of the creation and early history of man. Some very eloquent, and we think important, discussions upon subjects better suited to the pages of a theological review will also well repay the student's labour, and we shall feel happy if this general eulogium allure many readers

to the perusal of the work. As we stated above, the present article will be devoted to the analysis of a tract which stands first in the second volume, the title of which may be thus translated: *Outlines of the History of the Revolution which has taken place in German Theology since 1750*. The accomplished writer thus prefaces his subject.

"We shall attempt to produce a brief outline of the history of a religious revolution, which is unexampled in its character. With respect to the old religions of Greece and Rome there came a period, when they lost their authority over the spirit of man, at least over the higher classes of society, yet the priests always remained the guardians of the sanctuary. France also, nor in a lesser degree, Protestant England, has seen infidelity predominant among the higher classes, yet it was always the priestly order—whether from pure, or impure motives, whether skilfully or unskilfully—which undertook the defence of religion. In Germany, on the contrary, since the middle of the preceding century, a disbelief in the fundamental truths of Christianity has been developed, which has found its supporters principally among the priestly order, although many of them were not unconscious, that this tendency would at the same time undermine the foundation of the Church establishment. That in Germany circumstances assumed so different a form from that in the countries alluded to, may be accounted for by two causes. 'The want of independent authorities in the Church armed with sufficient power, such as the Church of England possesses, as well as the Catholic Church, and especially the theoretical tendency of the Germans, so peculiarly directed to scientific research, who fancy it a greater impiety to show inconsistency in science, than in practical matters to undermine institutions the most influential and most consecrated in the opinions of the people.'

How far Tholuck is right in assuming these two causes as sufficient, remains to be seen. The want of regularly constituted church authorities, of Episcopal government, the laxity of discipline, even where discipline was possible and called for by the people and the government, and especially the actual absence of fixed, unvarying articles, such as our Church happily possesses, were main causes which favoured the dissemination of heterodox and pernicious opinions, we think unquestionable; nor are we inclined to believe that Mr. Rose, in his most valuable work upon Protestantism in Germany, has at all exaggerated the evil consequences of such deficiencies. But the second part of the proposition is stated in a form we cannot approve of. That a wild, aye, and dishonest spirit of speculation was the real source of heresy Tholuck sees and proves most distinctly in this work, and we should have been better pleased had he assigned to it a more appropriate epithet than love of knowledge. That in many of the nation there was a genuine want and longing for a state of knowledge better adapted to Christianity, than the meagre and bigoted

theology of the period immediately preceding the outbreak of neology, we are by no means disposed to deny, but see no sufficient grounds to believe that such persons were the originators of the movement. Our author does in fact admit that another leading cause was heartless infidelity, and as after all it is most probable that his views are in accordance with our own, we must consider the mitigated form of the expression as a perhaps excusable artifice to soothe the irritability of national vanity.

The history commences with a sketch of the state of theology about the middle of the last century, of which we believe very little is known in England. The last mighty champion of the Lutheran Church against the Calvinists and Pietists, the learned Löschner, died A.D. 1749. At Wittenberg the theological professors were men of decent mediocrity, temperate opponents of Pietism. At Halle, the stronghold of Pietism, the energetic zeal of former years had degenerated into an anxious and timid defence of principles yet unabandoned. Siegmund J. Baumgarten was the only star, as Tholuck expresses himself; nor have his rays, we believe, traversed the sea. At Leipzig we meet with more illustrious names: Ernesti, then a youth, the learned Deyling in the evening of life, and the talented and pious C. A. Crusius, a disciple of Bengel, whose influence was, however, limited to a small number of devoted followers. Göttingen, under the active superintendence of von Münchhausen, produced some very celebrated theologians—the erudite Lorenz von Mosheim, and the distinguished professor of theology and oriental languages, J. D. Michaelis. Frankfort on the Oder boasted of a Jablonsky, Tübingen of its estimable, learned, and pious Chancellor Pfaff, the ecclesiastical historian Weissmann, and Cottar, the learned editor of Gerhard's *Loci*, a book well known in this country. The professors in the other universities we pass over, as a catalogue of obscure names is equally devoid of interest and instruction. Although nearly all the great theological writers of the day were more remarkable for a lukewarm, tolerant spirit, than for a hearty faith, the influence of Christianity was still deeply and extensively felt. In the preceding years Halle had produced most beneficial effects upon the whole of Germany. Its schools were thronged, numerous destitute orphans were educated by the charity of the university, and in the first twenty-nine years of its existence, when a powerful spirit of religion prevailed among its professors, no less than 6032 theological students received there an excellent education. According to our author Germany

had never since the time of the Reformation produced so many truly pious preachers, and lay members of the Church, as toward the end of the first half of the eighteenth century. A long catalogue of such names is given by him, and due praise bestowed upon the simple hearted and pious communities of the *Herrenhüter* or Moravian brothers.

Such was externally the flourishing condition of the Evangelical Church in Germany at the time when the spirit of unbelief was preparing an invasion. It contained in itself the hidden principles of dissolution, which we have already alluded to, and which we would in part more completely describe.

In the first place a very pernicious tendency was visible in the writings of the theologians, who began to separate piety from its invaluable defender, sound and extensive learning. The mystic dreamers looked with suspicion upon all human acquirements, and the class immediately above them bore a very close analogy to the Calvinistic party in our country. With the exception of Hebbel, which was assiduously studied at Halle under the auspices of the active and excellent J. H. Michaelis and his nephew E. B. Michaelis, very little was achieved by Christian professors. The stern unbending dogmatism of the orthodox school on the other hand repelled many conscientious and honourable men, and the German Church appears to have been very nearly in the same position as the English under the first two sovereigns of the house of Brunswick, to which few who love their church look back with other feelings than regret,—with, however, the immense disadvantage of having no fixed universal articles of faith, round which the good and wise have ever in this land been able to rally and make a successful defence. The spirit was departing; and the relaxation of the discipline, and the deadening influence of a false liberality, exposed the nation to the numerous assaults made upon it from without,—and which we now proceed to examine in detail.

The external forces which, in co-operation with the internal influences for ill, are declared by Tholuck to have been the most detrimental to religion, were—1st, The influence of Wolf's philosophy—2d, The influence of the English Deists—3d, The influence of France, and lastly the reign of Frederick of Prussia. These are very interesting points, and, as we think, the author displays equal ingenuity and candour in discussing their nature and effects.

The philosophical system of Wolf is principally remarkable for its dry, logical dogmatism, and to students familiar with the imaginative and visionary speculations of a

Schelling and Fichte, it is almost inconceivable that such a school should ever have originated and succeeded in Germany. A short account of the author, who, we believe, is not much known in England, will in some degree explain his popularity and influence. Wolf, who was professor of mathematics at Halle in 1706, had inspired many young men and theological students with admiration for his philosophical views and method, before his reputation was established by any other publication than the "*Philosophia practica universalis*." The principles of his pious, but somewhat narrow-minded, colleagues soon led to his dismissal, but contributed more than any single cause to the increase of his fame. Before his return to Halle in 1740, his influence was so firmly rooted, that theologians, jurists, medical and literary students adapted their discipline throughout to his principles and method. In theology his celebrated scholar Baumgarten, appointed to the professorship in 1734, was followed with an enthusiasm utterly incomprehensible to any one who at present reads his productions, so remarkable are they for their tiresome arrangement, and dull spiritless style.

In placing Wolf's philosophy at the head of the evil influences, however, we must remember that no direct tendency to infidelity is to be found in his works, or those of his immediate disciples. The chief injury it did to religion was superinducing a cold formal character, such as the Germans are disposed to look upon as the effect of Locke's writings in England. They talk an immense deal of nonsense on the subject of *mental type*, denying of course Locke's notions on the subject of innate ideas, but we have never heard them orally, nor seen them graphically, illustrate their principles in an intelligible form. Of course English education proceeds on Locke's principles, and is entirely opposed to the German "*Bildung*." The German mind is not accurate but imaginative. Locke has denounced the imagination perhaps too strongly in terming it a *fraud upon the reason*. Yet does the German mind greatly bear out our noblest metaphysician's principle. Hence their dislike to Locke from a moral consciousness, we conceive, of some truth in his notion, and of their illustrating a mental monstrosity in some degree. To resume our subject, Wolf was certainly, as the last-named philosopher, a believer, inclined even to a superstitious observance of external forms; and if, as has been asserted, but can hardly be proved, the principles of Leibnitz, which form the basis of Wolf's system, when systematically developed, lead necessarily to

fatalism and the pantheistic impiety of Spinoza, neither philosopher was at all conscious of such a tendency. Wolf's discipline and method were adopted readily by the Roman Catholic priesthood, and the aged philosopher alluded with evident self-complacency to the fact, that his books were used in the Jesuit schools of Rome, Vienna, and Ingoldstadt. But though the form might adapt itself to any and all religions, the effect was visibly and uniformly evil. The sermons of the last century—we are speaking of Germany, although the observation would not be very uncharitable if applied to England—were singularly cold and unspiritual. Philosophical definitions were generally employed in addresses to Christian congregations. Even the termini technici are frequently substituted for scripture phraseology, the Being who represents to himself the universe at once, for the Deity, *harmonia præstabilita*, the harmony of things, *ratio sufficiens*, &c. And in the discourses of the ordinary preacher, the style was formal and tasteless to an incredible degree. Our Saviour descended from the mountain, whereupon the preacher proceeds to define a mountain as an elevated place, &c.—and hundreds of examples might be adduced of naiveté, which it is almost impossible to read without suspecting a wag-gish intention, and this bare formalism was rendered disgusting by the most overweening conceit.

But a more serious evil was the distinction introduced by Wolf between natural and revealed religion, declaring that the former was matter of demonstration, the latter of faith—a distinction which at once opens the flood-gate to the deluge of infidelity. The followers of Wolf, as usual, went much farther than he intended or foresaw. Baumgarten did not indeed propound any positive heresy himself, but he cheered on the youthful Semler in his most mischievous career. The most singular production of the school is the paraphrase of the Bible, published at Workheim, A. D. 1735, with the title "*The Sacred Writings before the Time of the Messiah Jesus*." The first Part, in which the Laws of the Israelites are contained.* In this strange work an attempt is made to convey the general sense of the original in the idiom, and in accordance with

* Die göttlichen Schriften vor den Zeiten des Messie Jesus. Dereste Theil, worinnen die Gesetze der Iisreelen enthalten sind. The singular orthography is an attempt to imitate closely the Hebrew forms, a principle followed, as we have remarked, in the late edition and translation of the Pentateuch at Paris.

the habits and philosophy, of the 18th century. We give a specimen of the manner in which this design is executed, since we should not be surprised to see something of the same kind in England. The beginning of Genesis is thus rendered:—"1. All worlds, and our earth itself, were in the beginning created by God. 2. Now with regard to the earth in particular it was at first entirely waste; it was overhung with dark mists, and surrounded by water, over which violent winds began to blow. 3. But it became soon somewhat more light, as Divine Providence ordained:" and so forth. The writer of this precious stuff was Lorenz Schmid, a professed disciple of Wolf, who was pleased to approve of the general plan of the work, with a gentle reproof of the young author's indiscretion. Nor does Mosheim appear to have been greatly dissatisfied with its tone and tendency. The time, however, was not yet ripe for such an attempt, and the impudent and conceited author paid dearly for his presumption. He was arrested by a decree of the Imperial court, but afterwards was lucky enough to effect his escape at Anspach. At a later period he published a translation of Tindal's vile work "Christianity as old as the Creation." Tindal himself received, with Bolingbroke and all the Deists of the time, complete demolition from the hands of Leland, in a work which, though well known, can scarcely be too deeply commended for its plain good sense and judicious management.

The second influence is one that we regret deeply to find occupying so prominent a place in the dark records of infidelity, a regret which is increased by a profound conviction of the truth of the charge, and which is only alleviated by the hope that as the influence of England has been so powerful for ill, it will be no less powerful when exerted for the spiritual weal of Germany and of the rest of Europe. Tholuck speaks of the English Deists in these terms:—

"By far more considerable than has been hitherto supposed, or was on the first glance visible, has been the influence of English Deism upon Germany. We find among the English what is found neither in France, nor in Holland nor Italy; they possess already in the first half of the 18th century a tolerably complete system of rationalism. It would well repay the labour, to collect the views of the English Deists in matters of criticism, interpretation, doctrine, morals, and ecclesiastical history; it would be easy to show how rationalist ideas belong exclusively to later times; it would then also be evident how little foundation there is for the assertion of Dr. Bretschneider, that the immense advances of science in the 19th century have engendered rationalism. While French Deism, with the single exception of Bayle, contended only with wit-

ticisms and raillery, English Deism availed itself of the arms of learned investigation, and on this account their writings produced a much profounder impression upon the profound German than the French deistical works. Since the very commencement of the 18th century the English Deists were generally known in Germany, partly by German translations, though not frequent, partly by the medium of the French, by refutations of their works, or by large and numerous extracts in the periodical and popular works of the time."

Toland's pernicious book "Christianity not Mysterious," his Amyntor, Tyndal's "Christianity as old as the Creation," were answered by numerous professors, and some respondents more remarkable for zeal than discretion. The latter work appears to have produced an immense sensation; since in England, France, and Germany there appeared no less than one hundred and six answers. Lilienthal was the most distinguished antagonist of Deism in Germany. But not only the deistical works were extensively read in that country, but also to Baumgarten, Rösselt, J. D. Michaelis, Spalding, and even Schleiermacher, it is indebted for translations of our most valuable writing on the Evidences, such as Lardner's Credibility, and Leland's Deistical Writers. We are at the same time unwillingly compelled to admit that there is some truth in Tholuck's remark upon the character of some of those great works, though stated, we think, with much exaggeration, and too little of the charity and reverence which should guide a Christian divine when speaking of such men as Tillotson, Paley, and Butler:—

"These translations, and even the English writings in defence of religion, contributed in a remarkable degree to dilute and enfeeble the old Christian faith of the German theologians."

And again, after pointing the cold, rationalist tendency of the writings of John Taylor, the Presbyterian, a very learned and judicious writer, he quotes with great approbation the following remarks of Ernesti:—

"The Chancellor Pfaff is grieved that deistical writings have been translated into German, and with sufficient reason; but he is consoled by the consideration that the works written in defence of Christianity have also been translated. This consolation is by no means satisfactory. We have remarked that in these writings very seldom any thing is said which in the main points could offend a Deist, as we will show forthwith by the example of a celebrated writer. John Taylor, in the preface alluded to (viz. to the Epistle to the Romans) is speaking of the kingdom of God under the Gospel, and after giving a general description, endeavours to show that it is widely distinct from, and elevated above, natural religion. When, however, we come to an explanation in what this distinction and excellence consists, we find nothing but natural religion under a brighter light, and with clearer revelations of privileges, motives and hopes, than the wisest philosophers ever knew. That is to say, nothing but natural religion, revealed immediately

by God. This, which was formerly the Socinians' style, is at present the general system of English writers, who are so much praised and esteemed. The Deists cannot understand their own interest when they oppose this so vehemently, or show dissatisfaction with it, since in the main points it coincides with their own."—*Neue Theol. Bibl.* i. p. 115.

We are sorry, then, to see that, according to Tholuck and Ernesti, the way was opened for Neology by the English Deists, and that, while the outworks of Christian faith were defended, the internal principle, in which its vitality peculiarly consists, was betrayed by cold and but half-converted apologists. This is not a fitting place to discuss the question: to a certain extent we agree with them, but think that the charge is far too sweeping, and that a great deal of their harshness arises from a misconception of the character of our judicious and temperate writers.

The next preparatory cause is stated to be the influence of the French character and literature. It is indeed very amusing to remark the pliancy of the German; looking ever for *Bildung*,* as if conscious of natural ungainliness, the German youth without the self-centered pride of the English aristocrat, or the busy vanity of a Parisian merveilleux, continually exposes himself to ridicule by his vain attempts to assume manners essentially unsuited to his character. The German wants independence, and this want is readily avowed and severely satirized by their best writers—we believe it is in some degree to be attributed to the political condition of the nation, but still the cause lies deeper. We know no creature more thoroughly humane, warmhearted, and honest, more overflowing with the milk of human kindness, enlivened by frequent glimpses of eccentric, but always good-natured humour, than a German who is satisfied to be a German; but a heavy bumpkin dressed up as a man of fashion, is not a whit more ridiculous than a German baron who imitates the friskiness of Parisian wit, or the fine ton of a high-bred Englishman. We speak feelingly, for we sympathise too strongly with our Saxon kindred not to feel ashamed at the fact that foreign influence produced such deep and enduring effects.

The infidelity of France was of much older origin than the philosophists, to whose writings it is generally attributed. The

strange medley of open debauchery with the most degrading superstition, which disgraced the courts of Louvre and Versailles under the princes of Valois and Bourbon, could not fail to produce contempt for all principles apparently connected with such mummeries. The pious Michael le Vassor, Père de l'Oratoire, afterwards a convert to Protestantism, in the preface to his work entitled "*De la Véritable Religion*," gives the following description of Parisian society in the year A.D. 1658:—"On ne parle que de raison, de bon gout, de force d'esprit, de l'avantage de ceux qui savent se mettre au dessus des préjugés de l'éducation et de la société où l'on est né. Le Pyrrhonisme est à la mode sur beaucoup de choses. On dit que la droiture de l'esprit consiste à ne pas croire légèrement et à savoir douter en plusieurs rencontres. Qu'y a-t-il de plus insupportable et de plus chagrinant que de voir nos prétendus esprits forts se vanter de ne rien croire et traiter les autres de simples et de crédules, eux qui n'ont pas peut-être examiné les premières preuves de la religion?" (They only converse on reason, fine taste, mental power, on the advantages of those who know how to place themselves above the prejudices of education, and of the society in which they were born. Pyrrhonism is in fashion on numerous subjects. They argue that right-mindedness consists in not believing on slight grounds, and on suspending the judgment after numerous interviews. What is there more insupportable and annoying than to see our pretended "esprits forts" boasting of believing nothing, and treating other men as simple and credulous, when they themselves have never examined even the first principles of religion.) Might not this be easily taken for a description of Parisian society, in 1780? It is true that the Jansenists formed a noble exception to the general depravity about that time, but so great and intellectual a nation as the French really are, after all deductions made on the score of national vices, which we are not disposed to underrate, is never without some faithful adherents to the truth. But we hasten to consider the effect upon the neighbouring people. Tholuck is not inclined to accord much efficacy to Voltaire's deistical writings, as he justly demands what could a German scholar learn from a theologian like Voltaire, who looked upon that absurd Jewish fable, the Toldos Jeschu, as one of the most important documents for a history of Christ, and in an inquiry into the authenticity of the Mosaic writing, actually shows his ignorance of the meaning of the word Pentateuch? See *Philosophie de l'Histoire*, p. 221.—"Nous sommes convaincus que si les livres

* An Englishman considers education as a means for developing his abilities, fitting him for a profession or public life, not to speak of higher motives, as the strengthening of principles; but the German wants to be fresh cast, moulded into a new form—and what is the result? Read Wilhelm Meister.

de Moise, et de Josue, et le reste du Pentateuch !" (We are convinced that if the books of Moses, Joshua, and the rest of the Pentateuch.) But trifling as was the effect of these writers, with the exception of Bayle, upon the learned world, their corrupting influence upon the upper classes of German society, was terrific. In those days every German prince, count, baron, and freiherr, whose revenues sufficed to defray the expenses of the visit, held it to be his first duty to risk his fortune and his innocence in the metropolis of the civilized world, as Paris proudly designates itself, that he might return with the reputation and polish of an "homme comme il faut" to his dear stupid fatherland. And there, alas ! he found many a court, like that of Frederic of Prussia, which, if possible, outdid the Palais Royal in blasphemy, if not in wit. There, stripped of his armour of defence, of the respectable prejudices, and the sound principles of early education, he fell naturally and irretrievably into the current of vice and infidelity. A most characteristic description of the growth of irreligion under such influences is given by Laukhard.

One other cause also favoured the rapid dissemination of these germs of ill. The reign of Frederic, called the Great, was a fearful scourge, the consequences of which still affect powerfully the spirit of Germany. A king who never spoke of the clergy but with the contemptuous epithets of die Fafen, die Chekers—for Frederic loved to pronounce his vernacular tongue like a foreigner—who answered every application for official promotion on the part of a minister with "I know nothing of the Chekers,* if he is habile;" a king who looked upon all positive religion as a *préjugé*, and exercised his wit in moments of pleasantry upon no subject so willingly as upon the faith and professors of Christianity; a sovereign, at the same time, whose atrocious immoralities were glossed over by the specious talents of a wit and a genius, for Frederic was both, and who was looked up to with deference and slavish awe by all who surrounded him, necessarily exerted a most pernicious influence upon the religion of his court and nation.

But Frederic was far from confining his attacks upon religion to scoffing and raillery, as most of the *soi-disant* philosophers of that most ignorant, yet insolent and presumptuous school, for which he had so strange a predilection; he was, like Julian, a persever-

ing and ingenious persecutor of the Church, displacing all those whose talents and learning rendered the cause of religion respectable in the eyes of the world, and observing, with vigilant malice, the movements of all who professed the Christian faith. And the favour which was then withdrawn from the deserving, was proffered freely to any foes of religion, however disgraceful their conduct and character might be. Voltaire, Maupertuis, d'Argens, and the infamous cynic La Mettrie, basked in the sunshine of royalty, and Bahrdt, of whom we shall have occasion to speak presently, was received with the most flattering attentions by Zedlitz the minister, whose prolonged authority was in a high degree detrimental to the interests of morality and religion.

Such were the influences at that time at work in the heart of the German people, preparing the way for a general national apostasy. A philosophy in which dry formal dogmatism had abolished all living truth; clergy narrow-minded and persecuting in their orthodoxy, or secretly unfaithful to their sacred trust; theological learning without piety; mysticism without learning, ingenuity, or common sense: readers chilled, deadened and perverted by the study of English deists and semi-deistical divines: a nobility thoroughly contaminated by the contagion of Parisian vice, and fancying themselves men of taste and elegance, because they had followed the easy examples of licentious profligacy: the studious youth in general dissatisfied with the present, and looking forward with feverish anxiety for a new and totally different intellectual nutriment:—Such was the state of things when there appeared a man who resumed, in his own strangely blended nature, most of the faults, and by his talents supplied many of the wants, of the time—we speak of Semler.

There are two kinds of writers at all important epochs of intellectual reformation or transition, who for very different reasons attract the attention of a philosophic student of humanity. The former like a Socrates, a Plato, or a Bacon, are elevated by their comprehensive and powerful intellect far above the misty and varying currents that disturb the lower atmosphere of thought; they stand, as it were, upon an inaccessible height, from which they command an extensive view of all that has been achieved by their predecessors for the amelioration of man's condition, moral and intellectual, and appreciate all that is true and enduring in their discoveries: men who form the central point between the past and the future—who see with the prophetic eyes of genius, and direct the attention of their intellectual suc-

* Thank heaven we have no synonym for the word as yet. Our clergy have not yet been branded with such a nickname.

cessors to the paths by which they can most speedily and surely attain the one grand object of noble minds, the improvement of their fellow-creatures. A mind of kindred feeling, though far inferior in power, and concentration of purpose, will see in their works the whole scheme of humanity, and those names will shine with permanent and increasing splendour so long as a single heart beats with love for his brethren. But the other species, though infinitely less attractive, offers several inducements for attentive observation. They are men who, without self-consistency or internal elevation, convey a tolerably just idea of their epoch by following its tendencies, by reflecting its prejudices, by sympathizing with its defects, by combining in themselves most of its characteristics for good and evil. Such men are generally remarkable for extensive desultory reading; for considerable ingenuity in working out details; for a rapid, though superficial, comprehension of all phenomena of mere temporary interest; and above all, for unconnected and impotent attempts to realize their vague conceptions. England at the present day abounds in writers of this kind, who are fostered by the general development of certain faculties, by a brilliant but very incomplete education, which produces a dazzling effect, set off by a facility of style acquired so easily in a literary community remarkable for its graceful mediocrity. As we do not wish to rouse the susceptible feelings of the irritable genus, we forbear to instance one or two of this class, but have said enough to show in what sense we consider Semler as a personification of the German rationalist—not as the author, the head, or the cause, but as a fair and complete specimen.

It is but just to state that Semler was a man of pious sentiment, educated in the Christian faith, and thinking as a Christian whenever his wounded affections recalled his wandering spirit to the only source of consolation. The faithful description of his feelings on the death of a beloved daughter excites a strong interest for the man, and should teach us to judge of his aberrations with charity, though it ought not to blind us to the tendency of his writings. Ständlin, in A. D. 1791, was well aware of that tendency; in his excellent work entitled "*Critik des Systems der Christlichen Religion*," p. 342, he says, "Semler's dogmatic writings appear to me in fact to contain all the germs of theological scepticism, however little he may have been conscious of the fact." We do not entirely agree with Tholuck's appreciation of Semler's character, and shall not hesitate to appropriate his facts and rea-

soning as far as they coincide with our own.

The writings of Baumgarten in early life produced a great effect upon Semler, and prepared his mind for the unsteady scepticism we have alluded to; nor was the philosophy of Wolf neglected by the young scholar, although without any abiding influence upon his fickle character. From the unlimited atheism of French sciolists, he was preserved partly by his religious education; partly by his natural aversion to light and gay literature, in which the superficial tribe who followed in the wake of Parisian infidelity conveyed their deleterious principles. The learned Bayle is the only French writer to whom he alludes frequently, and whose work he strangely considered as an excellent preparation for theological studies,—a most perilous experiment for an unregulated imagination and unsettled principles. He read also with intense interest the Commentary of Whitby, a very learned but most unspiritual work, and the eccentric Whiston, whose critical labours he had attacked in one of his earliest publications, "*Vindiciæ plurium præcipuarum lectionum Codicis Græci N. T. adversus Gulielmum Whistonum*, Hal. 1750. The religious opinions which still survived in that transitional epoch, prevented his forming a system of consistent neologism, and induced him to frame a plan, so peculiarly the expression of his idiosyncrasy, that it suited few among his contemporaries, and was the cause that, notwithstanding his extensive reputation, he founded no school, and left no successor.

We have spoken of his disposition as the principal cause of his peculiarities. In his autobiography, *Lebenbeshreibung*, Th. i. p. 70, he speaks of his remarkably sanguine temperament, and Tholuck, who is somewhat addicted to physiological speculations, considers this in combination with a certain meanness and poverty of spirit (which he calls *Spießbürgerlichkeit*) as a sufficient explanation of them.

"Here," says Tholuck, "we find not that serious and thoughtful spirit which in its desires to unveil the enigma of the present and the past, pauses reverentially before the ways of science, to consider which may conduct him most readily to his goal, and to pursue it with that caution produced by the longing for the fixed, unvarying Truth, and with that sacred earnestness which proceeds from the consciousness that he stands before the sanctuary of humanity. Semler was a *helluo librorum*, who said with Logan, 'I love to smell better than to eat.' Without system or method he read now Selden de *Diis Syriis*, now Brentius and Schneppius, then pursued the alchymist traditions in the *Cosmographia* of Neander, and in Theophrastus Paracelsus; now laboriously investigated Vossius on the Septuagint, and Richard Simon on the Old and

New Testament, or the scholastic Quodlibetarii and Quidlibetarii, or attempted to digest the enthusiastic ravings of a Weigel and a Guttman."

There are indeed intellects so penetrating and comprehensive that from the most dissimilar and discordant materials they can elicit sparks of universal truth, but the generality of readers of this cast fritter away their time and talents in vain attempts to acquire the omne scibile. We believe that many scholars who have thus misused their natural powers, have read with a painful thrill the keen words of Pindar, *Ὁς δὲ διδάκτ' ἔχει ψεφνός ἀνὴρ Ἄλλοτ' ἄλλα πνεῶν οὐποτ' ἀτρεκεῖ* Κατεβα ποδὶ μυρίαν Δ' ἀρετὰν ἀτελεῖ νοῦς γυεταί. N. Carm. 3, 70, ed. Heyne, Oxon. We continue Tholuck's remarks.

"In Semler we find nothing but interesting notices; with all his sagacity in isolated facts and observations, he is but an empty-headed fellow. As is frequently the case with sanguine temperaments, he is rich in happy remarks, but separate flashes of summer lightning are not daylight. He had no power of combination or concentration. Such is his character as a student. But Semler was also a remarkably vain man, elated beyond bounds by the applause of his cotemporaries, depressed even to despondency by every unfavourable review."

We shall form a pretty correct opinion of the man if to these characteristics we add that his soul was without power of imagination, without depth of feeling or elevation of ideas, moving ever and only in the lower regions of thought, and all these defects exaggerated and confirmed by the deadening effects of a life wasted in petty intrigues and miserable squabbles.

We are obliged to pass over the interesting notices given by our author of Semler's education and gradual formation, although replete with instruction and warning, and proceed to indicate the general result of his labours in the several departments of theological learning. We must at the same time beg our readers not to be surprised by any inconsistencies or direct self-contradictions in his unconnected declarations. It is precisely the uncommon variableness of doctrine which he endeavours to demonstrate. Not penetrating into the heart of faith, never guided by the internal light which is ever refused to the shallow and vain, he sees nothing in religion but contradictions and differences, and boldly hazards the extraordinary assertion that all possible opinions in the Church are fair and satisfactory, provided that Christianity conduces to what he calls moral improvement.

The first department in which he introduced his plan of reform, a word sadly misemployed in more branches than one of the great science of humanity, was biblical

criticism. In early life he had displayed great ingenuity in two academical dissertations on the works ascribed to Macarius (which, however, sufficiently indicated the character of the man to a shrewd observer,) and threw himself with unbounded and filial reverence into the arms of Bretinger, the Swiss critic, who had rendered great services to the critical student by his edition of the Septuagint and various other works. We have not at present the intention or opportunity of estimating his character as a philologist, but confine ourselves to the consideration of his influence upon later rationalists. In the first place he shows the greatest levity in altering the received text, and whenever manuscripts vary, or words occur not evidently indispensable to the sense, is apt to reject them upon slight or no authority as mere glosses—a very dangerous proceeding, of which many instances are adduced by Tholuck. In more general criticism his doctrinal errors are equally conspicuous. He defends with great learning and talent the right of the early reformers to investigate the canon of Scripture, and claims the same privilege for himself and his cotemporaries. But how does he avail himself of this unquestionable privilege? By an assumption which none but fanatics, or artful sceptics, are in the habit of making. In his work on the Free Inquiry into the Canon of the Old Testament, p. 36, he says "the peculiar proof of the divine origin of a book is the internal conviction of the truths therein contained;" that is, the fides divina, which is otherwise termed the testimony of the Spirit in the heart of the believer. Following this conviction, which of course is entirely subjective, and varying according to the faith, sense, judgment and honesty of the individual, and which we may easily suppose was of a very peculiar character in such a mind, he quietly rejects the Song of Solomon, Ruth, Ezra, Nehemiah and Esther, and the books of Chronicles; and considers the authenticity of Joshua, Judges, Samuel, Kings and Daniel, as very questionable. As to the Pentateuch, he refers to his favourites, Simon and Vitranga, who had proved forsooth that these books, and Genesis more especially, were composed of different materials of uncertain antiquity, and thought it probable that the original work was lost during the Captivity, and recomposed by Ezra. As these sweeping hypotheses were nowise the result of critical or historical research, but merely proceeding from a distaste to the books themselves, we may readily conceive how vast a field was opened for more hardy and unscrupulous followers. The same wild and

impious course was adopted with the New Testament, and there seems no reason why any and every portion of Scripture upon the same principle should not be rejected at the discretion of any individual, if unsatisfactory to his fastidious taste.

We must also take into consideration the prodigious effect produced by the writings and authority of Semler upon the new-fangled system of biblical interpretation and commentaries, of which, under the somewhat pedantic appellation of Exegesis, the Germans were, a few years since, so proud, and which indeed tinged very deeply the works of a late very learned and influential prelate, and certain distinguished authors in our own country. This exegesis depends principally upon one leading idea of Semler, which, as it was blended with a certain portion of truth, was singularly persuasive, viz. that all the contents of the Bible, prophetic, miraculous, or doctrinal, are essentially modified by circumstances of time and locality, and can only be understood when those circumstances are correctly appreciated. As corollaries of this mischievous proposition, we are informed that all precepts and dogmas are equally liable to variation, and that they must be interpreted into the sounder philosophical language of the eighteenth century, before they can be applicable to these enlightened times; and therefore, that a judicious abridgment of the Bible, with a sound exegetical commentary, reducing the book of the Spirit as nearly as possible to a system of pure Deism, was the most desirable means of religious instruction. It is true that Semler's own method of explaining the effects of local and temporal influences was far from being generally adopted, owing partly to the instability of his views, and partly to the facility of unlimited novelty of accommodation, which every hungry student hoped to present in a more attractive and more saleable form; and that his paraphrases were soon disused and superseded, owing to his very inelegant, unreadable Latinity; (for which, by the way, the German theologians are generally remarkable;) yet the foundation was laid, upon which DeWette, Rosenmüller, Paulus, Ammon, Bretschneider, &c. have erected the glittering ice-palace of Neology.

In doctrines we may easily imagine the result of Semler's labours. He considers all the peculiar and vital dogmas of Christianity are mere accommodations to Jewish prejudices, little more than local ideas, under which he does not hesitate to include the colossal idea of the Kingdom of God. According to Semler the awful Jehovah is but a national Deity; the terms Mediator, Re-

deemer, Justification, no longer intelligible, and all the good that is to be derived from revelation is a general improvement of man's moral condition. With infinite self-complacency, which our readers have doubtless been often amused with in the shallow sceptics of ordinary society, Semler looks down upon those who, as he asserts, are more anxious that a man "*de diabolis bene multa credat, quam ut insignes leges amoris studiosissime observaverit.*"

But the department in which, above all others, the immense reading of this eccentric man produced the greatest effect, was ecclesiastical history; and here we cannot but express our regret that so little has hitherto been accomplished by our learned and orthodox divines: it is disgraceful to a Christian country to have no standard work on this important subject; but we hope and believe that ere long the want will be satisfied. As to Semler, we may easily imagine the bitterness and ingenuity of his attacks upon Catholic orthodoxy. These are the terms in which he speaks of the Christian writers of the two first centuries.

"The sources of most ideas prevalent at that time were far from genuine, the Alexandrine version, and many spurious Greek apocryphal writings, full of fanatic ideas and dreamy absurdities. It is particularly to be regretted that scarcely any thing remains of the so-called heretic writings. From many fragments it is easily seen that they must have been much better worth reading than the wretched treatises of the Catholic parties."

As Semler was entirely devoid of that penetrating intellect, which discerns, under the mask of apparent and superficial opposition, internal unity wherever it exists, he is totally without sympathy for such spirits as Tertullian, Augustine, Bernhard, or Thomas Aquinas. Every phenomenon is explained and judged according to the opinions of his own age and country; and with a wanton levity, which we grieve to see in some of our own theologians, he treats as absurd fanatics all who preached chastity and celibacy to the licentious Greek, and with zeal, whether wise or unwise, certainly excusable in a period of the most corrupt self-indulgence, mortified the flesh with its lusts in solitary retirement. The general effect of Semler's labours in Church history is thus ingeniously and most truly described by Tholuck.

"As in this branch of theology he was ever rich in novel discoveries, and frequently produced interesting facts from sources inaccessible to others, his writings on ecclesiastical and doctrinal history were extensively studied; and in those who read them carefully, as well as in those who had a merely superficial acquaintance with them, the general impression was, how astoundingly ill off the Church

was until the time when the illuminating spirit (die *Aufklärung*) waved her torch, how very little good had been effected by Christianity through so many ages, and how many wrong-headed enthusiasts had acquired an illustrious reputation in theology. The natural consequences among the young and enthusiastic was a general dislike and contempt for the study of the fathers and history of the Church."

In England we are well aware that the same feeling prevailed, though not to the same extent, but there are strong symptoms of a happy change. Without an intimate acquaintance with the writings of the Fathers, even the less talented among them, it is impossible fully to appreciate the transforming and renovating effects of Christianity upon the heart of man; without a very different knowledge of Church history than can be acquired from the cold Mosheim, or the bigoted Milner, or the desultory Jortin, an entirely false idea of our national worship and the relation in which we stand to the great Christian communities of Europe must necessarily prevail. In Germany also the first rays of a second dawn are tinging the atmosphere of thought, and ere long we trust that such things as these will be for ever forgotten in the fulness of a purer light.

We have dwelt thus long upon the character of the "immortal Semler"—as he is called by an author of no trifling authority in this country—for two reasons. First, because the opinion of a man like Tholuck is sufficient to prove that the severe judgment passed by Mr. Rose in his valuable work "on the State of Protestantism in Germany," p. 75—83, is not to be attributed to national prejudices or narrow views, as has been rashly asserted; and secondly, because we consider that in Semler are shown very fairly the tendencies of neological scepticism in a mind not totally divested of pious sentiments. To enable our readers to judge of their ultimate consequences upon the heart and intellect, we must give a concise account of the notorious Bahrdr, of all the leaders of this school the most remarkable for his talents and for his unbounded profligacy. Expelled from Leipzig, where he had been private teacher of theology, on account of a disgraceful transaction with a common prostitute, from Giessen for heterodoxy, and lastly driven from his position as superintendent at Dürkheim, in the Principality of Leiningen-Dachsburg, by the decree of the imperial court, and the pursuit of his creditors, this martyr of the truth, as he calls himself, fled to Halle, A. D. 1779. In other countries of Germany at that time the laws still forbade the promulgation of opinions avowedly sceptic, but Prussia offered an open field to every innovation, a

nations of its sovereign, but to the character of the people, who generally take the lead in all great intellectual movements of the German nation. We are indeed happy to state that Prussia has of late years partly atoned for her past offences by a school of profoundly learned and orthodox divines, but at the time when Bahrdr visited Halle it was the citadel of rationalism. Its professors seem to have been strangely perplexed by his arrival; his disgraceful conduct in private life prevented them from receiving him with open approbation; although it is very probable that his extraordinary talents, easy elocution, and lively wit, all devoted to the great object of their existence, the beating down the stronghold of antiquated prejudices, and erection of the glittering edifice of intellectual pride, inclined them to look with secret complacency upon their brilliant, but suspicious ally. Teller, at any rate, and the minister Zedlitz, were elevated by their position above all such trifling scruples, although the latter warned him seriously of the necessity of observing decency at least, lest people should imagine that the discoveries of the exegetical school were founded rather upon the desires of the heart than the conclusions of the understanding: an expression remarkable for the consciousness of unsound principles which it betrays. In depicting the rapid progress of infidelity in the heart of the man, we must apprise our readers that it is a true, though highly coloured portraiture of the feeling at work among the youths of the Universities. Bahrdr began his studies by the *Dogmatik* of Crusius, then much decried for their mystic orthodoxy, and a superficial tinge of devotion, or, at any rate, correct opinions imbued his youthful spirit at Halle. But very transient was their effect upon one who regarded all attainments only as a means of gratifying a pampered vanity. He describes in lively colours the bright illumination of his mind when from the lectures of Fischer he first discovered that a dictum probans, a clear and decisive text upon the most important doctrines, might be explained away or rejected as spurious. On arriving at Giessen he asserts that he had lost nothing of his orthodoxy *except* the doctrine of the Trinity, original sin, and the Lutheran doctrine of consubstantiation. In this university he succeeded in disbanding the belief in the reconciliation of man with God through Christ; and, as he informs us, in consequence of an afternoon conversation with a thorough free-thinker, happily transformed the doctrine into a scheme of moral amelioration. The full light, however, burst upon his awakened spirit at Halle. Semler's writings

overthrew all belief in the inspiration of Scripture, and the last faint struggles of the apostate to retain a vague faith in revelation, on the ground that Christ could by no possibility have discovered by his unassisted reason so perfect a system of morality, were quieted by Eberhard, who satisfactorily proved to the willing neophyte that Christ had taught no essential truth, which had not previously been declared by Socrates. But Bahrdt's own description of his final conversion is too characteristic and too instructive to be omitted.

"My soul now fell into its last fermentation; the impressions of education yet struggled within—but without power. Reason forced her way onwards with might. She stormed me with Semler's facts and Eberhard's possibilities. At present there wanted only a sensation to set the understanding upon its legs, that it might run off with the last bundle of prejudices, and fling it in the sea of oblivion. The sensation came. I remember no more on what occasion I was arguing some point against Trapp on the ground that his assertion appeared to me opposed to divine revelation. Enough: Trapp, in whose presence I happened thus perhaps, for the first time, to profess a belief in revelation, of which he certainly had expected to find no trace in so clear a head as mine, burst out into so hearty a laugh, cried out with so genuine an accent of good-humoured surprise: 'Heigh, heigh, the sensible Bahrdt believes in revelation. O Büttner, do listen,' (Büttner was talking to some of the company,) 'Bahrdt is still a believer.' Then sounded the knell of my faith. I was ashamed."

It is not our intention to follow this heartless, unprincipled infidel through the disgraceful scenes of a life passed in a tavern, kept by himself, where he turned his great talents to a double account, as ministers of his vanity and support of his reckless extravagance and licentiousness—or at the head of a secret society of illuminati professing and disseminating opinions nearly akin to those of Owenism—or in prison, where for a short time he underwent the due penalty of his ribald calumnies. Nor can we dwell upon his fearful sufferings in the last days of a mispent existence, terminated by a loathsome disease, the consequence of his own debaucheries. The history is fraught with awful warnings, but touched upon chords too deep toned for the pages of any but a religious publication. We can only say that the fears expressed by Mr. Rose, p. 195, are fully warranted by the profligacy of the students of that time as described by Tholuck.

With a brief survey of the state of the German universities under these influences we conclude our notice of this interesting work. At Frankfort we meet with two well-known professors, Töllner and Steinbart, the first appointed in 1756, the latter succeeded in 1774, and taught there until the commencement of the present century.

Töllner advanced with slow but certain step on the path of rationalism; he never openly abjured the truths of Christianity, it is true, but he evidently considered it beneficial only so far as it confirmed and extended the truths of natural religion, and their influence upon the happiness of mankind. But Steinbart receives from the neological journals an approving admiration, which sufficiently indicates the character of his writings. "No man," says the *Kirchen und Ketzer-Almanack*, "has overthrown and annihilated so many idols of the Church system. His predecessors were satisfied with attacking isolated errors, yet with a reserve that disguised their real system. This man has not merely demolished the old house, but he has erected a new palace in its room." Of Königsberg, Grieswald, and Breslau we have little to say, as the professors, following the same course, are little known in England. At Duisburg the learned Grimm led the way to Neologism, and Krummacher, whose later productions are so popular here, commenced life under the same banners. But the influence of Berlin is too important to be passed over hastily. Within the period we are considering, the names of Berliner and unbeliever were synonymous, and the opinions then prevalent are thus powerfully described by Oetinger, A. D. 1777. "They of Berlin know nothing of the Lord of Glory; they are bewildered with the vapouring presumption of the Leibnitzian philosophy; they know nothing of the grace of God, nothing of man as he draws near in spirit to the throne of grace;" in short, of any doctrine that distinguishes Christianity from Deism, or that cannot by some logical artifices be resolved into the principles of common reason. Now we must remember that Berlin was the centre of German nationality; that its professors, in learning, talent, above all, in refinement of manners and the graces of social intercourse, gave the tone to Prussia and all Germany. Here Sack, Teller, Spalding, in conjunction with the chief counsellor of the consistory, Dietrich, established the neological system thoroughly. In the case of a preacher at Gielsdorf, who avowed his belief that the Scriptures were not the word of God—that morality is distinct from religion as heaven from earth—that Jesus was the greatest naturalist—that his resurrection, as a mere occurrence, is wholly unconnected with doctrine, and that Moses was a deceiver,—the tribunal under Dietrich's presidency pronounced that the man if not a Lutheran, was to be considered as a Christian preacher! It would be superfluous to adduce more proofs of the state of religion at Berlin.

Göttingen was not far behind in the race. Rationalism was not taught in any university so barefacedly as by Eichhorn, and as the professors were men of extraordinary learning, its influence was tremendous. At its first foundation it boasted of Mosheim, Michaelis, and Hielmann, who certainly did very much to pave the way for their successor, J. D. Michaelis more especially. He appears to have been utterly devoid of pious sentiments, (by no means an universal failing in German theologians—for there are many like Semler, in whose hearts a religious education and moral life have preserved some seeds of faith uncorrupted by the venom of scepticism,) and although he strenuously defends the outworks of revealed religion, he is regardless or unconscious of the wounds rankling within. As Tholuck happily expresses himself, "Eichhorn did no more than strip the theology of the *homo naturalis* of the skin of supernaturalism, in which she moved so awkwardly, and presented her to the public without disguise."

At Jena we meet with Paulus, Augusti, and Henke, whose popular history of the Church is principally composed with the view of displaying the mischiefs of dogmatic orthodoxy, and we are sorry to hear that it is much read at present in Brunswick. At Erlangen the well-known Rosenmüller, who in his late *Compendium* of the *Commentaries* on Isaiah has changed the form only of his exposition, retaining all the opinions denounced by Mr. Rose. At Kiel, Marburg, Giessen, &c. more or less openly the same opinions are promulgated, and to close our long, and, we fear, tedious enumeration, nearly all the educational institutions of northern Germany, schools, gymnasia, universities, and pulpits, are occupied and administered by men to whom the very name of vital religion is odious, who treat its dogmas with supercilious contempt, or assault them with frantic hatred.

We cannot dismiss the subject without a few words upon the possible consequences of this extraordinary fermentation in the spirit of Germany. We are profoundly convinced that all great events, however terrible or pernicious in their immediate effects upon the agents themselves, and their misled contemporaries, tend ultimately to the instruction and benefit of humanity. With all the evil, the voluminous, ingenious, and erudite works of the most distinguished neologians, have, we think, already produced much good; they have thoroughly shaken and sounded every stone of the Church of Christ; they have removed some rubbish that had accumulated in the outcourts; they have demolished many tasteless decorations added

in later ages; but, above all, by their impotent and frustrated assaults they have demonstrated to the candid observer the adamant strength of the fabric. For the offenders this unforeseen and unwished-for result of course offer no excuse, but, very different degrees of blame attached to the leaders and followers of the movement. We believe also that when religion, as it most assuredly must do, regains its undisputed sway over the hearts of the nation, the causes of their late defection will be carefully and cautiously examined, and feel certain that all men of judgment will then admit the absolute necessity of adopting the form of Church government instituted by the Apostles, and which alone can expect the support promised by the Founder to his faithful people. The admirable work of Mr. Maurice on the Kingdom of Christ will best explain our meaning. We have indeed been informed, and as we believe on good authority, that the King of Prussia, whose predilection for our Church government and beautiful Liturgy is here justly appreciated, has expressed an intention of applying to the Bishop of London to ordain ministers who may form the groundwork of an establishment in that nation upon the same principles as our pure Church. Such an opportunity of extending the influence of truth must be peculiarly gratifying to the feelings of that excellent prelate to whom no less than eighty-three churches in his own important diocese owe their existence, a fact unprecedented in the annals of episcopacy, and who, by relinquishing the critical studies in which he stood pre-eminent, to devote his splendid talents and indefatigable energies to the defence and dissemination of the Christian faith, has assured to himself an undying name among the benefactors of mankind. Nor ought this to be less satisfactory to every member of the Church, which, by its unvarying doctrines, based upon the rock of ages, its establishments formed upon the model of primitive Christianity, and its consecration derived through an uninterrupted succession from the Apostles, has won so valuable a testimony. Fervent should be the prayers of every Englishman for the success of this noble undertaking. In the interim the conflict is stoutly waged by our author, with a few truehearted allies. Numerous indeed and desperate are his antagonists; and once more we call upon our countrymen, whose ancestors, as we have seen, are in a high degree responsible for the past, and who are themselves so deeply interested in the future of Germany, to cheer the faithful band with their sympathy, and to second their efforts by an effectual and zealous co-operation.

- ART. VIII.—1. *Letters, Literary and Political, on Poland; comprising Observations on Russia and other Slavonian Nations and Tribes.* Edinburgh: 1823.
2. *Insurrection of Poland in 1830–31, and the Russian Rule preceding it since 1819.* By S. B. Gnorowski. London: Jas. Ridgway. 1839.
3. *Historja, Literatary Polskiej przez Bentkowskiego.* Warszawa. (History of Polish Literature, by Bentkowski.)

WE can hardly be expected to do full justice to the important subject under consideration in the above notices, in the narrow limits prescribed to us: we can only hope to awaken the interest of our readers, by presenting to their attention a general outline of Polish literature. This we shall divide into five periods, not because such a division is natural—since the life of a nation is not like a thread which may be cut asunder and again united,—but for the sake of establishing certain prominent points, from which a better survey of the whole may be taken. Our first period will embrace nearly four centuries, from the introduction of Christianity (964) to the foundation of the University of Cracow (1337).

The dawn of literature in all countries is usually marked by poetic compositions; but if under this appellation are to be classed written productions alone, the inference must be that the Poles possessed no poet at all during this long period. The case is, however, widely different, for although Poland had not at that time any verse writers, yet at no subsequent epoch perhaps was that country more eminently rich in poetry. In order to judge of a nation's poetry, we must first learn how to feel it. The unassisted eye cannot separate the sun's beam into its elements; and the same observation is applicable to thought, which also has its own prism, through which images of the world are refracted on the mind in rays of poetry.

The Poles of ancient times, after their struggles in the field or in the senate were over, had little upon which to vent the activity of their spirit. Having abandoned the toils of trade and the pursuits of art to foreigners, the nobles felt a continual craving for active occupation and diversion. Agriculture was not with them an object of study, but of amusement,—a result of their love of nature. The aspect of fields, and forests and rivers, excited in them more peaceful, but not less profound emotions than the tumult of a battle or an election. When not engaged in these, the nobles, having no domestic occupation, passed their time in visiting or receiving their friends and kin-

dred, for the purposes of amusement or discussion. On such occasions he who had the talent of tale-telling played an important part, and the emulation which this circumstance inspired was the cause of the art being so cultivated that many individuals attained in it to a considerable degree of perfection. Mere facts being found insufficient to captivate the attention of the listeners, the narrator called imagination to his aid, and thus wondrous tales were multiplied, and their authors in fact composed poetry without being conscious of it. Hence arose a class of extempore oral poets, of a character altogether peculiar to Poland. They bore no affinity to the youthful troubadours or minstrels of other lands, who, with the guitar or lute in their hand, recited songs, frequently composed by others, on some foreign warrior, or the legend of a mysterious princess, visiting baronial castles to obtain some boon from their possessors. These early bards of Poland were grave nobles wearing long mustachios, who in the assembly of their equals, candidates like themselves for the throne, recited at the banquet their own compositions, recording events of domestic life, local histories, and anecdotes of persons actually present, whilst their companions drank, laughed or disputed round them, and the numerous attendants, distinguished by a variety of titles, received these narratives with tumultuous applause. The picturesque scene was still further enlivened by the grotesque appearance of revellers in strange costumes of divers colours, with half-shaven heads, and swords and girdles resplendent with gems, whilst young men, mounted on magnificent chargers, exercised themselves under the eyes of the guests in various warlike sports, riding the ring or displaying their dexterity in cutting off the heads of wooden or paper figures, representing infidels. To these men, whose existence may be said to have been one uninterrupted festival, the slightest meditation was a fatigue, and to this may be traced the absence of literary productions.

Such men cared naught for posterity, singing, to use the expression of an early Polish author, for themselves only the events appertaining to themselves. In their disregard of the illusion called fame, their boundless enjoyment of the present, how much vigour of mind was there, how much poetry!

Even in our days one of these poets of the ancient time has again appeared. Prince Radziwill, Palatine of Wilno, enjoyed as an oral poet greater celebrity than any of his contemporary authors, and his compositions, though never printed, were in the mouths of all. This nobleman, whom 12,000 soldiers

acknowledged as their lord,—who, when required to swear allegiance to Catherine, told her ambassador that he would rather make the Empress a gift of his wide domains for pin money,—reciting his marvellous tales with the gravity of a palatine, may furnish an idea of what oral poets must have been at the period in question

No festival was ever held without dances, which are also one of the national characteristics, and present a curious picture of Polish habits. Pre-eminent amongst these is the Polonaise, a dance suited to every age and station. It breathes no passion, but seems to be a triumphal procession. The most distinguished person of the company takes the lead, and this is termed *reywodzie*, to act a chief or king: it also bears an appellation signifying to act a marshal, owing to certain privileges being attached to this distinction which correspond to those of a diet marshal. Notwithstanding the respect paid to the leader, he may yet be deposed by one of the dancers exclaiming *odbiianego* (retaken by force), under which manœuvre is designated the famous *liberum veto*. The leader then resigns the hand of his partner to the new pretender; each male dancer dances with the female of the couple next to him, so that the last in the order remains excluded, unless by calling *odbiianego* in his turn, he places himself at the head of the dance. As, however, the too frequent exertion of this privilege would produce confusion, two means have been devised for averting the evil. Either the leader interposes his authority and terminates the dance, or the gentlemen, falling back, leave the ladies in the middle of the room, who continue dancing, selecting their partners, and excluding the disturbers of order; which process bears allusion to the confederacies formed for carrying into execution the decision of the majority. As the Polonaise is always accompanied by singing, it opens a field to oral poets, who on such occasions usually celebrate the merits of some distinguished character or queen of beauty. In our own times Kosciuszko was once thus honoured. Foreigners have perverted the peculiar character of this dance, and not even in Poland can it now be seen with its true and original features, except occasionally in some small circle of intimate friends.

The *Cracowiak* (la Cracovienne) is a more lively dance, and though in its figures it resembles the former, it is simpler, and indicates a less advanced state of society. It is, however, not so easy, as each dancer must also become a poet, and sing a couple of extempore verses. The *Cracowiak* is much in vogue with the people in the vicinity

of Cracow. Collections are made of these compositions, and they are highly esteemed in the literature of the country for their freshness of expression and vigour of thought.

The *Mazur* or Mazurka, deriving its name from the province of Mazovia, is perhaps the most national, as well as one of the most graceful dances of Europe. Any young Pole in warlike costume, and distinguished for boldness and amiability, soon becomes the hero of this dance. It is as eminently martial as the two former, and allows a still freer scope for activity, a suitable expression of the ancient Polish freedom. In familiar circles it is also accompanied by singing; and thus the Mazurka furnished an opportunity to oral poets for recording the most remarkable events of the national history. Every one has probably heard of the celebrated "Poland is not yet lost, while we live," with which the Poles now advance to battle.

The spirit of poesy pervaded the whole social frame, lending its hues to historical events, and transforming them into poetic legends. There wanted but a Homer to weave these into a Polish Iliad; and as attempts of this kind have been already made, perhaps this expectation may yet one day be realized. A heroine, though the reverse of the Grecian Helen, exists in Wanda, who, averse to unite herself with a foreigner in a marriage which would have entailed injury to her country, voluntarily perished in the Vistula; and her countrymen raised to her, as they have since to Kosciuszko, a mountain, as an enduring monument. Such legends, together with the traditional songs common to all classes, have now become the palladium of nationality, which will be preserved in the memory of the people in defiance of every human effort to destroy it. They are also considered the purest sources of Polish poetry. The best modern authors have sought inspiration in them, and several collections of them have been made, to which attention has been powerfully awakened by the following eloquent lines by Mickiewicz. We rejoice in appending such lines on popular song, which we have illustrated from the literature of the noble Swede in the present number, to the equally noble, though unhappy Pole:—

I.

"Tradition's lore! thou ark of covenant
Between the present and the by-gone years!
In thee the people shrine their hero's arms,
Their web of thought, their feelings' early flowers.
Still shalt thou ride unscathed o'er stormy waves,
So long as thine own people wrong thee not!

II.

Song of the nations! Guardian of the fane
Where the land's treasured recollections dwell,

The Archangel's wings and mighty voice are thine,
Nor dost thou lack the Archangel's vengeful sword.

III.

The pictured records flames may yet consume,
And armed robbers scatter holiest spoil;
But song shall live: it passes by the crowd,
And, from debased souls, that take no heed
To feed it with regrets, wa't'ring it with hope,
To woods it flies, where perched on ruins grey,
It tells the hallowed tales of other times.

IV.

If I could strike in other breasts the flame
That glows in mine, and call again to life
The forms of vanished greatness,—were it mine
To rouse with thundering words my brethren's
 hearts,—
Stirred by their native songs, their hearts once
 more
Should beat as beat the hearts of ancient days,
The grandeur of past times should fire their souls,
And for a moment they should live sublime
As lived their fathers through life's rolling years."

During this period, whilst the young nation was enjoying its tumultuous life, which may be designated as the heroic age of Poland, the introduction of Christianity prepared the way for civilisation of a higher order. It was long, however, before the new religion gained an absolute ascendancy, and the influence of the habits and ideas respectively appertaining to the ancient and new systems continued for ages to be nearly balanced. The slow progress of reform may be accounted for by the circumstance of foreign priests having been the first teachers of the nation, through the medium of the Latin language, which has continued to be employed in the liturgy to the present day. The first national schools were established by two religious orders, the Benedictines and the Cistercians, about the end of the tenth century, previous to which writing seems to have been unknown in Poland. The education furnished by these schools was confined to Latin; and the only monument of the Polish language bearing the stamp of Christianity is a hymn addressed to the Virgin (Boga Rodzica), supposed to have been composed by St. Adalbertus towards the close of the tenth century. This hymn is famous in Polish annals, from being sung by the Poles on going to battle, and it is still chanted in the cathedral of Gnesen in its original form. Casimir Sarbiewski made a Latin version of it, commencing "*Diva per latas celebrata terras.*" In 1325 the Diet of Leczyca passed a decree that no ecclesiastical dignity should be conferred on a foreigner, and that no one should be appointed professor in the schools who was not acquainted with the national language; but notwithstanding these measures, Polish does not appear to have made any scientific progress during this period.

In the early part of the fourteenth century

the Poles were accustomed to resort for study to the universities of Padua, Bologna and Paris, where some, owing to their great acquirements, were elected professors or rectors. About that period also appeared the first national chroniclers, Marinus Gallus, Matthew Cholewa, Vincent Hadlubek, and Martinus Strzebski, whose works, written in Latin, although intermixed with fabulous stories, are the chief sources of Polish history. Contemporary with these was the celebrated Vitellio (Ciolek), who explained the theory of light long before the time of Newton. Montucla* does not deny this fact, but refers the original discovery of the system to Al-Hazen, a learned Arab of the twelfth century. Whether or not Vitellio consulted the Arabic MSS., it would be difficult now to ascertain, but it is an indisputable fact that he was the first who made the subject known in Europe.

These few productions may be viewed as the dawn of learning in Poland, destined to brighten into day during the next period, which extends to 1622, at which epoch the Jesuits acquired universal ascendancy.

The history of learning at this time is also that of the University of Cracow, which fully deserves its ancient appellation of the *Alma Mater et Nutrix Polonorum*. Richly endowed by the monarchs of the country, as well as by the munificence of private individuals, it was placed by the bulls of Urban V. and of Boniface IX. on an equality with the other universities of Europe. It enjoyed great privileges, and the edifices belonging to it, like the temples of ancient Greece, were held sacred and inviolable. Students that had graduated there were considered noble in their own persons, and after twenty years of military or civil service, their nobility so acquired became hereditary. The authority of the university was not limited to its own students, but extended over all the schools in the country; over physicians, apothecaries, painters, printers, &c., and thus was not only a seat of learning, but exercised supreme magistracy over national education, the rector, on many occasions, enjoying a precedence of all the other ministers of state. Under such favourable circumstances it soon became a nursery of enlightened men, and its renown for learning attracted to it students from Hungary, Bohemia, Germany, and Sweden, each of which nations had its own Bursary. At one time, not fewer than 3000 pupils at inferior schools in Cracow were dependant on the university. Learning appears to have been held in great esteem, since the highest

* *Histoire des Mathem.* Paris, An. 7. Vol. i. p. 508.

offices in the kingdom were occupied by distinguished men of letters. Royal princes did not consider it beneath their dignity to become candidates for one of the degrees at the university, which were at the same time open to individuals of the humblest rank.

Of the various branches of study, mathematics seems to have made the earliest progress. Albert Brodzewski, a pupil and subsequently a professor of the university, from the great number of his pupils who became celebrated, may be said to have founded a new school in this science. Foremost amongst these stands the immortal Nicolaus Copernicus (Kopernik), erroneously called a German by some foreign authors, principally females, both French and English.* He was born in 1473, of Polish parents, in the town of Thorn, where his father, a citizen of Cracow, had settled ten years previously. Having received the first rudiments of education at Rome, he was sent to the University of Cracow, and after completing his studies there, travelled into foreign countries. On his arrival at Rome, he was appointed professor of mathematics, being then only in his twenty-seventh year, and the celebrity of his lectures soon gained him many pupils. He had also studied medicine, in which science he had taken a doctor's degree at Padua; and his knowledge in this department must have been uncommon, since he was styled the *Æsculapius* of Polish physicians. On his return he spent five years at Cracow, engaged in astronomical observations, but quitted that city on his uncle, the Bishop of Warmia, placing him in easy circumstances, by conferring on him the office of Canon of Warmia. Thenceforth he devoted himself exclusively to his favourite study, and as the fruit of his long meditations produced his work on the *Revolutions of the Celestial Bodies*, which makes an era in the civilisation of Europe. His merit needs not to be recorded here, but we cannot refrain

from paying tribute to his intellectual powers, by which alone he may be said to have penetrated with the naked eye into the depth of infinity. The room in which he used to prosecute his observations still exists, measuring about seven yards, constructed without bricks, and now unprotected even by windows. Another room below, where he probably kept his mathematical instruments, is now inhabited by a Prussian officer of police. Monuments have been erected to his memory at various times, but the most remarkable is that which was raised at Warsaw in 1830, by national subscription. It is the work of Thorwaldsen, and consists of a colossal figure of Copernicus, in a sitting posture, holding a sphere in his left hand, and a pair of compasses in his right; the head being adorned with a crown of seven stars. On one face of a marble pedestal are the words *Nicolao Copernico, grata patrii*, and on the opposite one the same inscription in Polish. It is worthy of remark, that Copernicus, like Newton, was concerned in the coinage of his country, and wrote a treatise "On the Organization of Polish Money." In his time astronomical calendars, entirely free from astrological nonsense, were published at Cracow, which are still highly esteemed in Austria. Martin of Olkusz, also a disciple of Brodzewski, composed, at the request of Leo X., a new Roman calendar, but the death of that pontiff prevented its adoption. The reformed calendar, produced sixty-four years afterwards, under Gregory XIII., does not differ in any respect from the calculations made by Martin of Olkusz.

Matthew of Cracow was one of the most learned divines of his time, and was successively elected rector of the universities of Paris and Prague. His work *Ars Moriendi*, published at Harlem (1440), belongs to the small number of books printed in xylography. His contemporary, Gregory of Sanok, was a distinguished philosopher, and according to the testimony of the historian Callimachus, worked a considerable reform of the prevailing taste in Polish literature. He accompanied King Ladislaus to Varna, and wrote an account of that expedition, which, however, was lost, together with his philosophical works. Callimachus records some of his witty sayings, from which it appears that, long before Bacon, he ridiculed the scholastic subtleties of Aristotle, calling them "*somnia vigilantium*." He was of opinion that the education of youth should commence with making them acquainted with poets and orators; and was very near being excommunicated by the Pope for his independent way of thinking. He died Archbishop of Leopold. John Dlugosz, who was tutor

* Madame de Stael in her "*Allemagne*," and Miss Martineau in her work entitled "*How to observe*." The circumstance of Copernicus having been born in Prussia, may have contributed to accredit this error. It should however be observed, that his birth-place lay in Western Prussia, called regalia, which was an integrant part of Poland, and so distinguished in opposition to Eastern or Ducal Prussia, a tributary province to Poland. Further, Western Prussia continued a Polish province until the second partition, and its population was never German, but Polish or Lithuanian. The life of Copernicus was written, and his system ably expounded by John Sniadecki, rector of the University of Wilno. This work has been translated into the principal languages of Europe. Montucla probably perpetuated the error by stating that he was born at Thorn, in Prussia, taking the modern geographical division instead of the ancient.

to the sons of King Casimir III., wrote the annals of Poland in elegant Latin.

At the very commencement of this period, we find some few compositions in the vernacular idiom, a part of the statute of Wislica (a collection of national laws drawn up under Casimir the Great), being written in Polish, as also some portions of the Scriptures which were translated at the request of his granddaughter Hedwiga, for her own private use. She also tried to introduce the national language into the church service, which would seem so bold an innovation by a queen renowned for piety, as hardly to be credible, were it not a fact attested by several historians, that Polish was actually adopted partially by Catholic congregations, and generally used by those of the Greek persuasion. Under the two last monarchs of the Jagellan dynasty, Polish came into general use, and was introduced at court, where the Italian and Latin languages had hitherto prevailed. It was even proposed at the council of Trent, that the church services and even mass itself, should also be performed in the national language. Works of such sterling merit were now written in Polish in all branches of literature, as render this period deserving of being styled the Augustan era.

The Polish language, which seemed as if it had slumbered for ages, thus started forth at once in perfect correctness, elegance, and richness. Some authors are at a loss how to account for this phenomenon, forgetting that it had always been the language of domestic life, and had been constantly cultivated by the oral poets. The introduction of printing, accompanied by unshackled liberty of the press since 1539, and, above all, the Reformation, contributed greatly to the progress of the national language. Religious dogmas, which, until then, had been wrapped in secrecy, like the Egyptian mysteries, were disseminated amongst all classes through an intelligible medium, and now for the first time the pride of learning appealed to the unbiassed understanding of the people at large.

The first original author who wrote in Polish was Ray of Naglowid, a Protestant. His prose writings are mostly of a philosophic cast, on subjects of morality, and eminently chaste in expression. He develops profound conceptions in a clear and graceful manner, as if he had modelled his style on that of Xenophon. His poetical compositions are less felicitous, being generally sententious and epigrammatic. Prosperous in his circumstances, a favourite of King Sigismund Augustus, and so wealthy as to be able to build two towns, one of which bears his name, he was able to follow undisturbed the various impulses of his mind. At one time he trans-

lated the Psalms for the gratification of the pious, and at another he produced his "*Model for Courtiers*." But his principal work is the "*Mirror of an Honest Man*," which may be considered as also that of the customs, ideas and prejudices of his time.

His contemporary Sebastian Klonowicz was surnamed the Sarmatian Ovid, from the facility with which he composed verses both in Latin and Polish, for which he seems to have been more remarkable than for poetic genius. His works allude to the ordinary occurrences of life, humour and satire being their prevailing qualities, as may be inferred by their titles, "*The Boatman, or a Trip to Dantzig*," "*The Purse of Iscariot*."

Far superior to both these was John Kochanowski, considered as the father of Polish poets. He appears to have been the happiest of them all, for he refused the honours lavishly offered to him: and preferred remaining in his quiet rural retreat, where he sung of love, of nature, and of his country. According to the custom of the Poles, he visited foreign countries during his youth, and in Italy became acquainted with *Vida*, whose poem on Chess he translated; and in France with the celebrated Ronsard, whose poetry, once so popular, is now little thought of, whilst that of Kochanowski is still prized for its grace and elegance. He was a voluminous author. In Latin he wrote three books of elegies, which have lately been rendered into Polish by Brodzinski. He also introduced classical literature to the more general notice of his countrymen by his excellent translations from Homer, Anacreon, Aratus, and Horace. His version of the Psalms was esteemed above all others, until the appearance of that by Karpinski, at a later period. Of his original poems in Polish, *Treny* or *Laments*, written on the premature death of his daughter Ursula, are the best, abounding in deep pathos, and interwoven with all those feelings of which only the heart of a tender father is capable. The critics of his own day, influenced by the precepts of Horace, objected to his excursive freedom; but that which they condemned as a defect, he prized as the very soul of poetry. In his poem called *Fraski*, or *Trifles*, he displays the various emotions of his mind, produced by the contemplation of human life, and his unaffected witty sayings are familiar to all even at the present day. The general admiration felt for his genius and character, suggested to Niemcewicz the subject of a beautiful drama, in which he has idealized the life of Kochanowski. The scene in which his soul overflows in one of his laments is deeply touching; and another, in which reapers bring him, with songs and music, the first fruits of their harvest, and in which he is represented as

joining in their dance beneath the shade of a linden tree in his work yard, presents an admirable picture of primitive Polish manners. Three pastoral poets, Simonewicz, Zimorowicz, and Gawinski, dwelt in the bosom of picturesque scenery, within sight of the Carpathian mountains. From the sloping hill-sides they beheld villages, fertile fields, mirror-like lakes and streams, "whispering their lingering notes of sylvan music." Hence they excelled in the imagery of pastoral life.

Besides John Kochanowski, three other poets bore that name, two of whom were his brothers. Andrew Kochanowski produced an elegant version of Virgil's *Æneid*; and the translation of Tasso's *Jerusalem*, by Peter, is considered a masterpiece of the Polish language.

Numerous prose writers, Catholic and Protestant, belong to this period. Of these, the most eminent, Seklucyan and Wujek, both translators of the Bible; Birkowski, a celebrated preacher; Gornicki, Sirenus, Starowski, and Orzechowski, who were all political writers of the highest merit. The latter wrote the reign of Sigismund Augustus. The labours of these men established the national language on a firm basis, and although it has since acquired perhaps superior elegance, the energy, boldness and freedom of its features are nowhere to be found so fully, as in their compositions.

Whilst men of letters in Poland were thus zealously cultivating their native idiom, the study of Latin was not less ardently prosecuted, and many works of the highest merit in that language were published. Cromer, called the modern Livius, wrote a history of Poland; Janicki, an elegant poet, received the laureate crown at Rome. The clergy were distinguished for their erudition, and took a prominent part in the literary contests connected with the Reformation. The before-named Orzechowski (better known under his latinized name of Orichovius) displayed in his disputes with the court of Rome, the eloquence of a Demosthenes. Cardinal Hosius, president of the Council of Trent, whom Bayle calls the greatest man that Poland ever produced, was one of the most powerful antagonists of Protestantism. His numerous works have been translated into all the European languages, and some of them were republished not less than thirty-two times during their author's life.*

As a reformer, John Laske enjoyed universal esteem, and the admiration professed for him by Melanchthon and Erasmus, especially the latter, bordered on enthusiasm. He was

* The best edition of his works is that of Cologne, 1584. A life of him, written by his countryman Rescius (Reszko), appeared at Rome, 1587.

the intimate friend of Archbishop Cranmer, who invited him into England to assist in completing the reform of the Church. For a time Laski superintended the foreign Protestant congregation in London, which seems to have been instituted as an asylum for reformers who had been obliged to fly from their own countries. Intercourse between the literary characters of England and Poland was at that time frequent; and an Englishman of the name of Cox, who was professor of eloquence at the University of Cracow (1527), was the first person who established a periodical in Poland. It was called *Ephemerides*. There were more printing presses in this age in Poland than at any other period; in Cracow alone there were fifty, and books were printed in no less than eighty-three provincial towns. Besides these, many private typographies were established by nobles in their own residences, and the works of Polish authors were also published in forty-six foreign towns. The huge volumes *Fratrum Polonorum* bear witness to the extraordinary mental activity of that epoch. John Haller was the first printer in Cracow. The first notice of him is in 1485. The Polish writers assert that their countryman, the necromancer Twardowski is identical with the German Faust. It is at least a fact that this latter name is the translation of the Polish one. Persecuted on account of his magic art, Twardowski took refuge in Germany, and, assisted by Guttenberg, he set up a printing-press at Mayence. In his own country he still enjoys an unrivalled popularity, owing principally to the clever tricks he is reported to have served the devil. In his last hour he composed a hymn to the Virgin, in consideration of which he was only suspended before the gate of hell.

Learning received a powerful encouragement by the establishment of the Universities of Wilno, (1583), founded by Stephen Batory, and of Zamosc, by John Zamoyski. The latter, whose character might be compared with that of some of the most illustrious men of antiquity, a great general and statesman, was equally distinguished for learning, and had exercised the office of rector at the University of Padua. He also excelled in oratory, an art which seems to have been always much cultivated by the Poles; for we find many speeches recorded by their historians, addressed to the troops by celebrated commanders, such as Chodkiewicz, and Zolkiewski, the conqueror of Moscow.

Neither were the Poles at this period, when the rest of Europe was convulsed by religious wars, less distinguished by that highest test of civilisation, liberty of con-

science. Leopol was then, and has been ever since, the residence of three archbishops, of the Greek, Arminian, and Latin persuasions, yet was there never any inquiry made, to which of their three cathedrals a man complying with the regulations of the government resorted, in order to receive the communion. Political power was the reward of this tolerant spirit; and their princes sat on the thrones of Bohemia and Hungary. Lithuania also, and the Protestant countries of Livonia and Courland, united themselves to the Polish empire, and even Muscovy at one time offered her crown to a Polish prince. Poland thus became one of the most considerable as well as enlightened states of Europe, and would probably have remained so until the present day, but for the withering influence of the Jesuits during the succeeding century.

Period III.—To the abolition of the order of the Jesuits, in 1773.

On the death of Sigismond Augustus, there were, besides the bishops, only seven Polish and still fewer Lithuanian senators of the Roman Catholic persuasion; and had that sovereign, the friend of reformation, lived a few years longer, Poland must inevitably have become a Protestant country. To avert the impending ruin of Romanism, Cardinal Hosius, to whom we have already adverted, brought in the Jesuits (1564), a measure by which he deserved equally the eternal gratitude of Rome and the maledictions of his country. Full liberty of conscience being guaranteed by the law of the land, the new comers dared not at first attempt openly to persecute the Protestants, and they therefore resorted to a more secure method of bringing into a contempt the defences of religious freedom, by debasing the minds of the people through the influence of education. They recommended themselves to general favour by their admirable discipline, learning and zeal; but their total disregard of moral principle was the means by which they most effectually promoted the success of their designs. Still, they made but little progress during the lives of King Batory and of John Zamoyiski, which latter excluded them from his University of Zamosc: but on the accession of the bigoted Sigismond III. their influence rapidly increased, and in 1622 they were absolute masters of the national education. Their satanic scheme was detected and exposed with much skill, but unfortunately without success, by Broscius (Brozek), one of the most learned men of his time, in a Polish work entitled "Dialogue between a Landowner and a Parish Priest."

Besides the Latin Grammar of Alvarez, purposely designed to be of difficult acquisition, and therefore suited to detain their pupils until they had obtained complete domination over their intellect, the Jesuits zealously taught the scholastic philosophy, that by promoting discussion upon outward forms only, they might divert the minds of their pupils from inquiring into the reality of things. Another means of moral corruption employed by them was their fulsome flattery of the benefactors of their order, and abusive invective against their opponents, palatable only to the depraved taste acquired in their schools. To the classic purity which the Polish language had attained in the last period, succeeded a barbarous jargon, and whole works were composed in the Macaronic style (Latinized Polish) which disgraced the national literature during the next century.

From this general corruption of literary taste must be excepted the sermons of Skarga, remarkable for energy, boldness, and grandeur of pulpit oratory. His admirers compared him to a rock in the midst of foaming waves, which for a time arrests their progress ere they pursue their blind course; and his words to the piercing arrows of the Tartars against whom he animated his countrymen.

Contemporary with him was the Latin poet, Casimir Sarbiewski, who received the laureate crown from Pope Urban VIII. He left five books of Lyrics, Silviludia, the Lechiad, an unfinished epic, besides epigrams. His fame as a poet spread throughout Europe. Grotius preferred reading his works to those of Horace, and many celebrated men of various nations expressed in verse their admiration of his muse. Coleridge, in his *Biographia Literaria*, esteems him above Cowley. "His style," it is there said, "and diction are really classical; while Cowley, who resembled Casimir in many respects, completely barbarizes his Latinity, and even his metre, by the heterogeneous nature of his thoughts."

The name of the distinguished botanist Zaluzianski deserves to be mentioned, as he was the first to describe in his *Methodus Herbaria*, the sexual fructification of plants, long before Linnæus, to whom the discovery is commonly ascribed. The latter could scarcely have been ignorant of this work of his predecessor, which was published at Prague. (Dubois sur la Littérature de Pologne. Berlin edition. 1778.)

Very little original Polish poetry belongs to this period, though many translations were made from the classic writers. Much attention also was paid to French literature

which, then in its zenith, extended its influence over Europe, and some excellent versions of Corneille, Racine, and Voltaire were published.

The department of moral philosophy was less barren. The *rules of wisdom and prudence*, by Maximilian Fredro and Stanislaus Lubomirski, exhibit pure and sound principles of morality, the matured fruit of active life and experience, expressed in short sentences, and couched in graceful phraseology.

The views of enlightened men are, however, thrown away upon a population trained in oblivion of the science and wisdom of their ancestors. To the existing evil of a corrupted literature was now added abolition of the liberty of the press. Sound notions of law and justice became in consequence still more obscured; anarchy pervaded the government, freedom degenerated into licence, the peasantry fell into a condition bordering on servitude, and the limits of the country were contracted by the reception of the Cossacks.

Period IV.—to the partition of Poland in 1795.

No nation is perhaps more indebted to women than the Polish. One female was the means of its conversion to Christianity, and another rendered it powerful by effecting its union with Lithuania. At this unfortunate epoch, a third averted from it the greatest of all misfortunes, its moral ruin as a nation. More afflicted than all others by the melancholy aspect of affairs, the mother of the princes Augustus and Michael Czartoryski, bound her two sons by a solemn oath to use every exertion to restore the former greatness of Poland, over which the elder branch of their house, the Jagellon family, had exercised hereditary sway. Pursuant to their resolution they endeavoured, even during the reign of Augustus III., to introduce reform into the government; and when their efforts were frustrated by the intrusion of foreign powers, still faithful to their views, they endeavoured to work them out by remodelling the system of public instruction. Part of their plan also was to place a native of the country on the throne, as to the government of foreign, and especially of the two Saxon monarchs, the greater portion of the evils which had afflicted the nation might be referred; and the election of their nephew Stanislaus Poniatowski, a zealous patron of letters, was brought about by their efforts. One of his first measures was to establish a military college at Warsaw, which, under the superintendence of one of the Czartoryskis sent forth Kosciuszko and other distinguished men. The royal resi-

dence at Warsaw was thronged with native talent, and ranked, during his reign, amongst the first in Europe. It may be mentioned, that the king assisted as a private gentleman at the weekly meetings held by literary men, always encouraging and rewarding talent. "Every thing," says Lelewel, "began to bloom anew under his reign." The example set by the Czartoryskis and the king was followed by other nobles, whose residences, in lieu of a host of idle retainers, were now filled with men of science. The two brothers, Zaluski, employed their whole fortune in collecting a library of 200,000 volumes, 20,000 of which were by Polish authors, and amongst them 1400 poetic compositions, which they then munificently bestowed on their country as a gift.

Such efforts were warmly seconded by the Order of the Piarists, which, though established as early as 1642, had not hitherto become in any degree influential, owing to the exclusive supremacy of the Jesuits. But at this juncture arose from amongst them Konarski, a man of uncommon genius and great energy of character, and his appearance was the signal for the triumph of the Piarists. He fearlessly attacked the prevailing system of education, together with the *liberum veto*, thus arming against himself the power of the Jesuits and the prejudice of the bulk of the nobility. Nevertheless he prevailed, and effected in 1740 that reform of the national schools, by which history, political science, natural philosophy and mathematics, hitherto wholly disregarded, thenceforth obtained their due importance, and was rewarded by the king with a medal bearing the inscription "*Sapere auso.*" He was the first who made a compendium of national laws, in eight folio volumes. He also dedicated his ample fortune, and a pension granted him by Louis XV., as a testimony to his merit, to procuring translations of the best foreign works, and to sending pupils of promise abroad to perfect their education. The Jesuits, perceiving that their power was about to depart from them, changed their measures, and connected themselves with the movement party. Now, however, the first spoliation of Poland took place in 1773, in which year also the order of the Jesuits was abolished, and their immense possessions appropriated to the purposes of education, which now became the care of the government, and was superintended by a minister of state. Science, art, and industry, once more began to flourish, and the improved state of the country bore testimony to the diffusion of knowledge. One grand result of the all-pervading spirit of improvement was, the Constitution of the

3d May, 1791, by which act of national reflection the nobles voluntarily despoiled themselves of their exclusive privileges, admitted the citizens into their rank, and restored the rights of freedom to the peasants, placing the new social order on a firm basis, by the establishment of hereditary monarchy. Not without reason was the poet's lament ;

"Sarmatia fell unwept, without a crime."

At the head of the authors who shed lustre over the disastrous reign of Stanislaus, stands Ignatius Krasicki, Bishop of Warmia, who being brought into contact with Frederick the Great, on the partition of Poland, soon became the favourite of that monarch. He may be called the Polish Voltaire, wit being the principal characteristic of his numerous works ; but whilst he ridiculed superstition he never assailed religion. In the "*Monomachia*, or *War of Monks*," an heroico-comic poem, he exposed in a matchless style the bigoted absurdities of the monkish orders. Under the pretext of endeavouring to allay the irritation excited by this poem, he composed his "*Anti Monomachia*," in which, affecting to apologize for his former attack, he showed up monkish superstition and indolence in still more glaring colours. He was equally satirical in his "*Myszeis*," "*The War between the Mice and the Cats*," in which he ingeniously ridiculed the dissensions that prevailed in the national councils. The poem is based on a fabulous tradition which the Poles have, in common with some other nations, of a dissolute monarch, Popiel, who, with his ministers, the *cats*, was devoured by *mice*. Homer's "*Batrachomyomachia*" is the only known composition of the same nature.

His next ambition was to produce a national epic, and the "*War of Chocim*," in 12 cantos, is an historical poem, containing many noble passages, on the model of Lucan's "*Pharsalia*:" though, on the whole, it must be considered a failure. His keen wit is best displayed in his satires. He wrote also two hundred fables, and his biographer remarks, that had he left only these and his satires, he would still be entitled to the first rank among poets. The saying of the French, that after Lafontaine had so faithfully portrayed nature, he broke his pencil, was amended by the Poles, who said that he lent it to Krasicki, and in truth his fables are so popular, that they are familiar to every child. His epistles in verse and prose are models in this style of composition. He also made a translation of Ossian, the best in the Polish language. His prose works are not less numerous, and three of his novels are faithful pictures of the man-

ners and peculiarities of his nation. His "*Dictionary of Useful Knowledge*," in two large volumes, gives proof of his extensive learning. He wrote also an account of the poets of all nations, giving specimens of their beauties. His imitations of "Plutarch's Lives" are less successful than those of Lucian's "Dialogues of the Dead," in which he is again witty, graceful and humorous. All his works have a classic finish, and they have gone through more editions than those of any of his contemporary authors.

Bishop Adam Naruszewicz displays in his writings great depth of thought, with the grave austerity imbibed in the schools of the Jesuits, to which order he belonged. His satires seem to strike the guilty with the force of lightning. But he attempted too many styles to be successful in all, though some of his *Idylls* are excellent, and in his *Odes* he is not unfrequently sublime. His versions of Pindar and Horace have not been surpassed in force and fidelity ; but his prose writings are far superior, his translation of Tacitus being a master-piece, and his history of Poland, in six volumes, embracing the Piast dynasty, and composed on the model of the Roman historian, is distinguished by the same precision of thought and expression. He also wrote an excellent biography of the celebrated warrior, John Chodkiewicz, and a work on the statistics of the Crimea.

Of all the writers of his time, Stanislaus Trembecki possessed the most poetic fire, but he wasted it in his youth in panegyrics of the great, which were truly beautiful, and it is only to be regretted that they were not more deservedly bestowed. He seems to sing from an overflowing heart, borne aloft on the fantastic wings of his genius, careless of blame or praise from the crowd below. In his principal poem, "*Zofiowka*," so called from a magnificent country seat in the Ukraine, he embodied, in fascinating language, his long meditations upon man's terrestrial and posthumous existence. Count de la Garde made a French translation of it, which he caused to be beautifully printed at Rome, together with the original. In his latter days, Trembecki lost his memory to such an extent that he did not recollect that he had ever written any thing. He fell into a state of misanthropy, and would have no companion near him except a Cossack boy, with whom he played chess, or listened to his songs. The only visitors he admitted were swallows and sparrows, which he permitted to build their nests in his apartments, and it is said that he even knew the genealogies of his feathered guests.

Dyonizius Kniaznin, who was educated

in the Jesuits' College, bitterly complained afterwards that "he had wasted the golden season in irksome and unprofitable trifles." He was an elegiac and lyric poet of deep feeling, and, like Tasso, became enamoured of a fair one above his humble station, which unlucky attachment ended in the derangement of his mind, and he died "worm-eaten of love." His patron, Prince Czartoryski, erected to his memory a splendid monument in a church-yard near Pulawy. The three dramatic poems of Kniaznin—"The Treble Marriage," "The Gypsies," and "The Spartan Mother," inspired by the *genius loci*, written for the theatre at Pulawy, rank high for their lyric beauties. His "Balloon," suggested by an unsuccessful attempt made at Pulawy, to construct a buoyant sphere, borders on an epic poem, by its length and dignified flow. His odes are full of strength and harmony; and his "Laments of Orpheus for Eurydice" breathe a deep pathos.

Francis Karpinski was the best song writer and pastoral poet of this period. His chaste mind and pure piety eminently qualified him for translating the Psalms, and a more successful version than his can hardly be expected. He was also a dramatic writer of considerable merit.

We pass over here the names of several distinguished poets, some of whom we shall have occasion to mention in the next period. From amongst many political and philosophical writers may be singled Kolontay; the Astronomer Poczobul, the friend of Maskelyne; Ignatius Potocki, an excellent orator and a great statesman; Prince Adam Czartoryski, the father of the present, whose work entitled "*Thoughts on Polish Authors*" deserves particular attention, as he was the first writer who combated the prevailing taste for French literature.

The literature of this period, modelled after Latin and French authors, subsequently received the appellation of classicism, and some modern critics have gone so far as to deny the character of poets to writers in this style. The works of Pope afford the best sample of this class.

Period V. and last, up to the present day.

The admonition given by Rousseau to the Poles, that if they could not help being swallowed up by their enemies, they might at least prevent these latter from digesting them, appears to have been constantly acted upon by them ever since the loss of the national independence, a misfortune which has only had the effect of still further arousing their moral energy. Having sung on the ruins of their country, their emphatic "Poland is not yet lost while we live," they created for themselves a Promethean exist-

ence, a moral power, more enduring than that which they had just lost. Their first act was to establish the Society of the Friends of Science and of Belles Lettres, for the preservation of the national language, now endangered by the intrusion of foreign idioms, and for the collection of materials for the national history, which had been scattered abroad by the pillage of the Zaluski library, as well as others, both public and private. Their exertions were signally crowned with success. One member of the society, Kopczynski, composed the first Polish grammar, which has hitherto been unequalled, and is a masterly performance, on account of the numerous complicated forms of the idiom, only to be paralleled by those of the Latin or Greek. Another, Linde, compiled a Polish dictionary, in six large quarto volumes, into which he introduced all the Slavonian dialects, a work of such vast extent and erudition that it seems hardly credible that the lifetime of a single individual could have sufficed to produce it. Aloisius Osinski composed another still more voluminous, but not embracing the other Slavonian dialects. Albertrandy, the first president of the society, a distinguished Polyhistor, left three hundred volumes of materials connected with Polish history, which he had collected from various MSS. whilst in Sweden and Italy, and which he had retained solely by the force of his extraordinary memory, having been prohibited from making written extracts from them. A far more important work, however, was that of Count Ossolinski, entitled "*Historico-Critical Notices of Polish Authors*," consisting of twenty volumes, of which three only have been published, owing to the premature death of the writer. He also devoted his fortune to the purchase of a large library, which he presented to the kingdom of Galicia. We regret that our limits will not allow us to extract his apposite remarks on the literary merits of his ancestors.

The services rendered to his country within this period, by the Abbé Stanislaus Staszyc, were very remarkable. Destined from infancy by his mother to holy orders, and always habited like a monk, he used to take pleasure in after-life in adverting to this circumstance, the gravity of which at that time escaped his attention. Manhood changed the playful boy into a scientific author, a poet, and a philanthropist. His "Life of the Great Zamoyski;" an original poem "On the Human Race;" a translation of all Homer's works, and of Buffon's "Epochs of Nature;" established his fame as an author of pre-eminent merit. Having carefully investigated the soil of his native

country, and visited the Carpathian mountains, he composed the best existing work on the geology of Poland. The establishment of a college of medicine and law at Warsaw, and the erection of a splendid house for the Society of the Friends of Science, were acts of his private munificence. He purchased also a large domain, which he divided amongst a number of peasants, subject only to a very moderate rent, the funds arising from which were destined to the gradual acquisition of neighbouring lands, with the same benevolent intention. He gave considerable sums to various hospitals, and continued a liberal patron of learning; whilst in the government, he discharged the duties of minister of state, director of the mines, and a commissioner in the board of education, and, at his death in 1826, was president of the Friends of Science. His name became an object of national veneration, and of hatred to the Grand Duke Constantine, who would not permit a monument to be erected to his memory, and caused his works to be burned.

The polite literature of the first half of the present period was chiefly marked by the same patriotic character, and on this account we place at the head of its poets Julian Niemcewicz, born in 1767, though he had already distinguished himself during the reign of Poniatowski, and is still living. He is the Nestor of Polish patriots, having witnessed two great revolutions in his country, and with his friend Kosciuszko, fought under Washington, of whom he has written a life. His compositions in verse consist of tragedies, comedies, satires, lyrics, songs, elegies and fables, and in all these departments he has attained a well deserved celebrity. His chief glory, however, consists in his "*Historical Songs*," a composition quite peculiar to Polish literature. It is the history of his country in lyric verses, set to music and illustrated with plates, in order to render the events more impressive to youthful minds. The book is in every Polish household, and venerated next to the Scriptures. The biographical sketches by which these songs are accompanied are still more valuable, and might be placed by the side of Plutarch's Lives. He has shown his diligence as a scholar in his History of Sigismund III., which may vie with Schiller's "*Thirty Years' War*," and has compiled besides three volumes of notices relative to the national history. His historical novels are perhaps among the most successful imitations of Scott's. "*Leybe and Siora*," a Jewish tale, is known to the English public. He also translated Pope's "*Rape of the Lock*," and the "*Ode on St. Cecilia's*

Day, Gray's "*Elegy*," "*Rasselas*," and some of the poems of Wordsworth and Campbell, and Racine's "*Athalie*." He still continues to write, "*soothing*," as he says, "*the bitterness of exile by singing to his mournful lyre*."

The fame of Woronicz, late archbishop of Warsaw, first arose from his sermons, which seem to be immediate emanations from the purest source of morality, couched in fiery, almost dithyrambic language, resembling that of the Hebrew prophets. His poetry is in one style only, the heroic. In his "*Sybil*," so called from the temple at Pulaway devoted to the preservation of national monuments, the poet successively conjures up from their graves the ancient kings and warriors of Poland, bidding them to look upon the present desolation of their country. The words put in the mouth of Casimir the Great, as he sinks back into his tomb, "*Is this that land?*" may be classed with the sublimest passages of ancient authors. In his unfinished epic, "*The Diet of Wislica*," Woronicz gives an admirable picture of the Poles, with their swords still reeking with blood, their captives chained to their horses, assembling after the long turmoils of war to enjoy the sweets of peace. His style bears more resemblance to Milton's, in the "*Paradise Lost*," than that of any other Polish poet.

Casimir Brodzinski, called the poet of the heart, formed his taste upon the extemporaneous songs of the Cracovians, which he first brought into repute. His poetry is characterized by a *naïve* simplicity, grace, and spontaneous inspiration; and no one better than he understands how to move the human heart to tears for the woes of others; happiness, according to him, also having its portion of tears. Besides his numerous Polish, Bohemian, and Servian songs, he translated Schiller's "*Mary Stuart*" and Scott's "*Lay of the Last Minstrel*." His critical treatises on Polish literature abound in vivid fancy, tempered by philosophical research; in both of which he excelled all his contemporaries.

Another poet, Francis Dmochowski, although he left no original compositions, may yet be named in company with the three last, as the most successful translator of all Homer's works, of the "*Æneid*," of the "*Paradise Lost and Regained*," and of Young's "*Night Thoughts*." Though he is not free from the charge of have sometimes misunderstood the Hellenic poet, still he at least never falls below his English originals. He adapted with like success the "*Ars Poetica*" of Horace and Boileau to Polish literature.

Within the last twenty years no fewer than three complete versions of Homer and five of Virgil have appeared; and one Przybylski performed the gigantic labour of translating all the works of Homer, Ovid, Virgil, Milton, Young, Ariosto, Camoens, and Gesner. During this period the drama, which appears to have been more tardy in its growth than other branches of Polish literature, reached a high degree of development. John Kochanowski had written, for a special occasion, his tragedy of "*The Return of the Greek Ambassadors*," which was acted at Ujazdow; but the best dramatic composition of that epoch was the tragedy of Josephus Castus, by Simonowicz. During the reign of the Jesuits many pieces were composed on scriptural subjects, which were performed in monasteries and schools, and at Christmas time for the amusement of the people. In the schools reformed by Konarski the acting of plays made a part of the boys' education; and a number of excellent pieces, but without the admixture of female characters, were composed by Bohomelec. Zablocki, in the time of Poniatowski, wrote some excellent comedies in the early part of his life, but discontinued his labours on embracing the ecclesiastical profession. "*The Nuncio's Return*," a comedy by Niemcewicz, may be considered the best composition of that epoch. Since the partition, and during the ephemeral existence of the grand-duchy of Warsaw, Boguslawski, an actor, has done the most for the Polish drama, by keeping up the national theatre at Warsaw, and visiting with his itinerant troop the various parts of the dismembered country, as well as by his original works and his translations of "*Hamlet*" and "*Macbeth*." A complete version of Shakspeare is now in progress of printing. Boguslawski's "*Cracovians and Highlanders*" was the first national opera brought out in good style, and was soon followed by many others, who, supported by the several distinguished musical composers, such as Kurpinski, Elsner, Lipinski, Sowinski, and Szopen (Chopin), brought this branch of the drama to perfection. The progress of the national drama, as well as the introduction on the stage of the great English dramatic compositions, received a temporary check through the influence of the French theatre and its powerful supporter, Louis Osinski, whose versions of Corneille's "*Le Cid*," "*Les Horaces*," and "*Cinna*," and of Voltaire's "*Alzire*," might be mistaken for original compositions. To the same class belonged Felinski: his tragedy of "*Barbara Radziwill*" (wife of Sigismund Augustus, supposed to have been poisoned

by her mother-in-law) may rank with the best pieces of Racine. The same subject, however, was handled with more boldness by Wenzkyk, the Polish Schiller. His tragedy of "*Glinki*" is truly national and original.

One of his most successful followers is Korzeniowski, a professor at the university of Kiow; but there is less energy in his male characters, owing to the present inauspicious state of political circumstances; tragedy, besides, not being allowed to be represented; his heroines are, however, beautifully drawn, though often belonging to fashionable circles, and he carries his love for decorum so far as to cause them to be magnificently arrayed even after their death. His style is eminently feminine, sparkling with gems and jewels. Poland has not yet brought forth her Shakspeare—what country has yet, or ever will? But with regard to melo and comic drama she yields to none. Count Fredro is her Molière, sharp-witted, profound, lively, and always national. Some of his comedies have been represented with great success on the Berlin Theatre.

Many Polish ladies have cultivated the drama; and being on the subject of authoresses, we shall mention Elizabeth Druzbacka, who distinguished herself in the reign of Poniatowski. A gifted child of nature, without learning, her idyllic poetry, imbued with a strong feeling of devotion, is not inferior to that of Thomson in its sentimental descriptions of nature. Princess Czartoryska composed a work on gardens; and in accordance with the principles laid down in it, she embellished her seat at Pulawy, so as to render it an abode for the children of fancy, taste, and contemplation. Delille dedicated to it a beautiful episode in "*Les Jardins*." A more important work of hers is "*The Pilgrim of Dobromil*," of which Polish history is the basis and morality the superstructure.

The Princess of Wirtemberg, the daughter of Princess Czartoryska, in her "*Tales*," has admirably painted the domestic life of the Polish peasantry, and of the higher orders in her novel "*Malvina*," with an acuteness of observation not inferior to that Miss Edgeworth has shown in her "*Tales of Fashionable Life*." But the most distinguished of Female Polish writers is Madame Hoffman Tanska, whose "*Legacy of a Mother to her Daughter*," "*Tales*," and her works on religion, and on the education of her sex, have rendered her an authority on this last-mentioned subject. She was entrusted by the government with the superintendence of all the schools for young ladies throughout the country, and with the direc-

tion of an establishment at Warsaw for the formation of governesses.

When the kingdom of Poland was established, in 1815, national education, which, for the preceding fifty years, had been the object of so much attention, was still further promoted by the introduction of parish schools, as also by establishments for the instruction and formation of teachers, the destined missionaries of truth amongst the people. The College of Medicine and Law at Warsaw was also converted into an university, which numbered amongst its other distinguished professors, Brodzinski, Louis Osinski, and Lach Szyrma,* and soon acquired a reputation nearly equal to that of the university of Wilno, one of the most flourishing in Europe.

We refer our readers to a work of the highest character for brilliancy of style, accuracy of detail, and deep and passionate sorrow for his fallen country, by S. B. Gnorowski, for all points relative to the last-mentioned university. And on no occasion have we more regretted our inability to extract largely, in an article so extensive in reach as the present, from a source of pure truth and unexaggerated sentiment.

"From this university," says Lieut. Gnorowski, "commenced a revolution, not only in the manners and character of the students, but also in the literature of the country; to which Adam Mickiewicz, one of the radiants, added a lustre and originality never before attained."

Mickiewicz must be considered in a twofold aspect. In one view, as an apostle and martyr of that fervent patriotism which impels with irresistible power his countrymen to struggle to preserve the national existence; in the other, as the deliverer of national genius from school trammels, directing its course in the independent track of Homer and Shakspeare. He was born in 1798 in Lithuania, his father being an advocate, and having commenced his studies at Novogrodek, completed them at Vilno with great credit. In the latter city he published, in 1822, his first work, two volumes of popular songs and ballads, with a preface, much in the style of Byron's "English Bards and Scotch Reviewers," by which he silenced for ever the advocates of the so-called classicism. This was soon followed by his "Ode to Young Men," which was crowned with the greatest applause by his fellow students; and next appeared "Grazyna," a poem in three cantos, deriving its name from the heroine of the piece. She was the wife of a Lithuanian duke, who, to revenge some

injuries he had received from a kinsman, leagued himself with the Teutonic knights, their common enemy. The night before the expedition, Grazyna, unknown to her husband, sent a message of defiance to the Germans; and then, disguised in his armour, defeated them at the head of his soldiers; averting, by her own death, the calamities with which the treacherous scheme threatened her country. To the allusion contained herein, to Poland devoting herself for the reunion of her dismembered parts, was partly owing the very great success of this poem; though, as a literary production, it is not inferior to any of the subsequent compositions of Mickiewicz. His second regular poem, "Dziady," (The Feast of the Dead,) has been already reviewed in this Journal.

During the persecution carried on against the students of Vilno, Mickiewicz was exiled to the Crimea, "where," as a Polish poet expresses it, "he strewed diamonds." "Sonnets of the Crimea," one of his happiest inspirations, were published in Moscow, where, through the influence of the enlightened governor, Prince Galiczyn, he was permitted to sojourn, and afterwards at St. Petersburg, where he became the lion of the fashionable circles. His own peculiar situation suggested to him the idea of "Wallenrod," the most admired of his poems. Wallenrod, a Lithuanian of the fourteenth century, on being made prisoner by the Teutonic knights, the sworn enemies of his country, entered their service, became grand master of the order, and leading their army into Lithuania betrayed it to destruction, after which he surrendered himself, and suffered death at their hands. This work, of great poetical merit, and glowing with patriotism, caused an extraordinary sensation among the Poles. Some fancied they saw in it an allusion to the romantic career of Prince A. Czartoryski, but it is universally believed that it hastened the outbreak of the late insurrection. Certainly the author seems to have had some political view in writing it, and the motto he has prefixed to it favours the supposition: "Dovete adunque sapere come sono due generazioni da combattere; bisogna essere volpe e leone." The Poles are as proud of this poem as the Germans are of Goethe's Faust. Mickiewicz at length obtained leave to travel in Germany, contracted an intimate friendship with Goethe, who never failed when occasion offered to express his admiration of the Polish poet. In 1832 he fixed his abode at Paris, where he published the "Third part of Dziady," in which he describes the sufferings of the students at Vilno, and some scenes of it are in the highest style of tragedy. His

* Lach Szyrma is the author of the best work in the Polish language on English literature.

longest poem, in twelve cantos, "Sir Thaddeus," appeared in Paris, 1834. It does not aim at one grand catastrophe, nor contain any conspicuous character, but presents a masterly picture of the ancient habits of the nobility, and of their patriotic exertions since the partition; describing the impenetrable primitive forests of Poland with their countless inhabitants; her exuberant corn-fields, and even her very kitchen gardens. It is in our opinion the most successful attempt at *Georgics* ever made; and Poles, when they read it, wonder how they can have trodden amongst such beautiful objects for centuries, and been so little alive to them. It has been criticised for its want of any direct moral, but the censors forget that the highest morality of man, considered as an æsthetic being, is to look upon all creation as a temple of beauty. After having revived the poetic and historical traditions of his country, and pointed out its natural beauties with a Byronic imagination, though deeply imbued with religious sentiment and philosophic faith, he composed a work of lamentation, of retribution and justice, of consolation and hope, which in proud modesty he entitled "A Book."* It consists of two parts. The one called "The Acts of the Polish Nation since the beginning of the World to its Crucifixion," is a synthetic and theosophic history of Poland in Biblical phraseology. As our national taste is completely opposed to the application of Scripture to politics, and as great disgust has been excited in Paris by the efforts in this shape by the Abbé Lammenais, we shall not extract from this first portion.

The second is a series of precepts and parables addressed to the Polish pilgrim, and these display the poet's great power of lyric composition, his knowledge of his art, and the soul of a patriot, and a believer, energetic, but resigned, sympathising and persuasive. Counsels, intreaties, threats, consolation, hope, all are to be found in this second part. Some of the parables are keen satires upon the men and affairs of the present day.

Mickiewicz has also translated Byron's "Giaour," and the Farewell Song from "Childe Harold," which has been set to music, and is now become a national melody. He has lately been appointed Professor of Latin Literature at the University of Lausanne, and is said to be engaged in writing a history of Poland, which is looked for with the utmost impatience.

Anthony Malczewski is the author of a

beautiful poem called "Maria," the subject of which has been since successfully dramatised by Korzeniowski. The poet, however, died in obscurity and poverty, as little known as was for some time his poem; which now, as if in atonement, is more admired than any other of its class. It was the first Polish work printed in England.

Severyn Goszczynski is probably the most unlettered of the living poets of Poland, having been forced by Russian persecution to wander during a portion of his youth in the steppes of the Ukraine, where his fancy imbibed a character of wildness often bordering on the horrible. His poem in three cantos called "The Castle of Kaniow," which has also been reviewed in this journal, is founded on an occurrence during the revolt of the Cossacks, the most bloody page in the annals of Poland. The few details he gives are narrated in so fascinating and original a manner, as to awaken regret that human atrocity should have become the theme of a poet possessing so much genius. Even the love episode partakes of the same dark character. Some of his lyric songs are free from this excess, and are truly beautiful. Bohdan Zaleski, another poet of the Ukraine, is the very reverse of the preceding. His Cossacks are not savages revelling in blood, but generous warriors leaning on their lances, and caressing their steeds, swift as the winds of their steppes, careless of the morrow, expatiating in the boundless enjoyment of the present.

The few songs he has published seem like the breathings of some magic voice, so perfect are they in their harmonious whole; and his "Rusalki," (the nymphs of the Ukraine,) are airy textures woven of all the feminine graces of the native idiom. His longest poem is "Mazeppa." Lord Byron led the way on this subject to him as well as numerous others; but Zaleski far surpassed the productions of his competitors. This series of Ukrainian bards may be closed by Thomas Olizaroski, a native of Volhynia, a young and rising poet, who, in the legends he has published in Leopold, Cracow, and London, has shown an originality of thought and boldness of imagination quite peculiar to himself. From the latest of these collections we select one piece, "Ascension to Heaven, a Mystery," not because it is the best, but that it alludes to recent events; and it would be interesting to mark the change in the Polish mind since the composition by St. Adalbertus of the "Hymn to the Virgin."

1.

* This work has been translated into all European languages. The English version is by Col. Lach Szyrma.

"With curious eye and timid steps, I walked
Midst Emphyrean gardens, where was naught

To check my course, save still increasing wonder.
I wandered amongst trees which know no change
Since first they sprung to life; for upon them
Time has but glanced with an unwithering
smile,

And passed them by with undestroying hand;
Flowers shed their sweets, and seemed to me as
types

Of some that grow on earth; but brighter far
Than our frail race, which bear to those
Such likeness, as, unto his Maker, man.

2.

"Beyond, a road there lay through fields of light;
And as I doubting stood, an angel form
With eyes of gladness met me.—'My wings,' he
said,

'May bear thee soonest to the Eternal's throne.'
His pinions shed their silvery brightness round,
And, in his radiant arms upborne, I left
The gardens, and the fields of light below.

3.

* * * *

"What are those stars that follow in our track?
Their light seems earthly—are they female souls?
Then burst a voice from out that starry throng—
'We* are the victims of the foulest deed
That stains a tyrant's course. We go, to cry
For justice at God's throne.' 'Go,' said the angel,
'But'—and then he paused, as though unknowing,
Or unwilling more to say."

The nature of this poem, however exquisite, does not admit of such ample quotation as we could wish; even Milton is not read on so awful a subject as the Christian Trinity, and words placed in the lips of Jesus, in which such strong terms are used as to represent Poland as an incarnation of the Christ, do not aid her cause, but lower it, and render that horrible which we wish, equally with every Pole, should be vindicated and honoured.

Foremost among the philosophic authors of the new literature ranks Goluchowski, late professor at the University of Vilno, and a pupil of Schelling. His work, "Philosophy, as reflected in the Life of Nations," when made known in Germany by means of a translation, produced a great sensation in that country of metaphysical thinkers, owing to the perspicuous, concise, and elegant phraseology, in which it presents ideas which to the majority of readers would appear the most speculative abstractions. Maurice Mocknacki, combining extraordinary depth of thought with unusual brilliancy of imagination, has reduced, in his "*Polish Literature*," to a system, the principles of *Æsthetics*, as manifested in the compositions of Mickiewicz and others. A work on the same subject, lately published by Grabowski, forms a worthy pendant to the above. A high rank in the reformed

literature is held by the historical writings of Joachim Lelewel, Professor of History at the University of Vilno, and subsequently a member of the Diet, and of the national government during the last insurrection. It would not be possible here to enter into a close investigation of the respective merits of these works, which are not fewer than eighty in number, all relating to the annals either of Poland or of other Sclavonian tribes and countries. On this account, though highly popular in eastern, his name is but little known in western Europe. "The Edda," and "Numismatics of the Middle Ages," are his only excursions on foreign ground. His labours have been of essential service, by throwing light on the most obscure passages in the history of Poland, and of the Sclavonian countries in general; thus bringing into notice a new region of civilisation, hitherto disregarded, or treated in a tone of arrogant superiority by the other half of Europe. Lelewel combines in himself the most opposite qualities, the imagination of a poet with the enduring patience of an antiquarian, but he wants that precious gift by which the historian opens as it were the book of fate, penetrating characters, and embracing at one glance the course of ages. Owing to this deficiency, Lelewel, notwithstanding his other valuable qualities, is neither Livius nor Gibbon; and to the same source also may be referred the blunders he has committed in his political career. Still he stands pre-eminent among the historians of his nation, and the materials prepared by him only await the touch of a master-hand to become the crowning work of Polish literature.

The conclusion drawn by all who peruse this rapid sketch must necessarily be, that the language and literature of Poland have advanced to their present very high degree of perfection in an equal ratio with the increasing misfortunes of the country during the last fifty years. This phenomenon appears so extraordinary that it deserves the serious consideration of every reflecting mind. What, indeed, should seem more unfavourable to the progress of a nation's language, than its political annihilation, and the incorporation of its dismembered provinces with several foreign states, each respectively intent upon destroying every vestige of its former nationality? Yet, it is a fact that Polish literature is actually now reaching its zenith, and at no former period could Poland ever boast of more distinguished men in every department of science, learning, and political eminence. Since the third partition in 1795, all the public museums, the Library of Warsaw, numbering

* An allusion to six hundred Polish girls who were carried to the military review of Woznesensk.

200,000 works, that of the Society of the Friends of Science, scarcely less rich, and Prince Czartoryski's Library at Pulawy, containing invaluable materials connected with Polish history, and not fewer than 20,000 English works were, after the melancholy events of 1830, carried off for the second time to Russia. Yet these unpropitious circumstances, so far from retarding, have promoted the growth of national literature; and Polish works of sterling merit have been lately published, not only in several parts of Poland, but at St. Petersburg, Moscow, and Vienna. In fact, the hitherto unsuccessful attempts made for the recovery of independence have invigorated instead of weakened the moral energies of the Poles, and that ardent feeling of patriotism which in former times was principally confined to one class, now animates alike the inhabitants of every cottage and palace in Poland. That feeling alone, without admixture of Jacobinism, democracy, or any other political theory, prompts the rich and the poor to submit to every sacrifice for the restoration of their country. Their literature is more intimately connected with the history of their incessant political struggles than is the case with any other nation; it is a most potent weapon, which they now understand how to use. The time may yet come when the following passage shall have ample realization, though not designed for them, even on earth, as it assuredly will in Heaven—"In that time shall the present be brought unto the Lord of Hosts of a people *scattered and peeled*, and from a people *terrible* from their beginning hitherto; a nation *meted out and trodden under foot*, whose land the *rivers* have spoiled, to the place of the name of the Lord of Hosts, the mount Zion."—*Isaiah*, xviii. v. 7.

ART. IX.—1. *Canton Register*, July to December, 1839.

2. *The Chinese vindicated, or another View of the Opium Question, being in Reply to a Pamphlet by Samuel Warren, Esq. Barrister at Law in the Middle Temple.* By Captain T. H. Bullock, H. H. the Nizam's Army. London: Allen and Co. 1840.

6. *Is the War with China a just one?* By H. Hamilton Lindsay, late of the Honourable East India Company's Service in China. 2d edition. London: Ridgway. 1840.

THE age of wonders in every period, we presume, has been the time of the historians of that epoch; but still we think there are strong probabilities in favour of this estimate not being very far remote from the truth with respect to our own. Inventions, unquestionably of the most singular character, mark it beyond all others, as in this respect surpassing; and of historical events certainly one may be adduced, "*sui generis*," *War with China*. For more than 200 years matters had remained in the "*status quo*," when the great movement party in this country considered the Celestials had enjoyed quiet enough, and immediately proceeded to set three hundred millions by the ears, and it will be more by luck than wit if it does not discover what it is to *catch a Tartar*.

It has been our endeavour, in a previous paper, to set the Opium Question in a proper light before the country, and we shall now proceed to show that far larger interests are becoming involved, and that matters are now assuming an aspect of alarm that few but the foolhardy and reckless men that sway the present fortunes of this state can regard without concern. True courage consists not, in our notion, in the mere deprivation of the sense of fear, but in the knowledge and the appreciation of difficulties, and in manning the spirit to meet them. Hence Antar and the heroes in Homer vary strongly in their character. The Bedouin we see without fear, and he loses interest, for we always anticipate the sequel; but in the Grecian warriors we find the appreciation of danger and the resolve to dare it. In the one it is animal impulse, in the other high-souled feeling. The appreciation of danger, then, is perfectly consistent with the highest element of courage; and courage unconnected with this feeling may be compared to the Malay, who is prepared with blind fury "*to run a muck*" at all he meets, and who becomes proportionately valueless since he cannot be directed against the right object. Before these lines are read we shall have war proclaimed by our valiant governor-general against the Chinese Empire, though he has quite enough to do with India, for any power he possesses to manage it. This proclamation will, probably, at no re-

mote period, array against us in India and China 500 millions, together with Mahomet Ali, Dost Mahomet, and the Schah of Persia. Pretty well for Asia. Let us look then into the origin of the Chinese affair, the Opium Question. Unhappy England!

"Poppy nor mandragora,
Nor all the drowsy syrups of the world,
Shall never minister to thee that sweet sleep
Which thou ow'dst yesterday."

Opium had netted to the Indian government, on the showing of the Bombay merchants themselves, during twenty years past from 1839, from half a million sterling annually, until latterly it had attained to two millions sterling per annum. Of course China had the benefit of this, and the Emperor of the Celestials found all his subjects nodding in whatever direction he moved, and was even smoked out of his own imperial palace. His people seemed to be plunged in one all absorbing lethargy, and the Celestials were fast abjuring their allegiance to him for the victorious Somnus. Half measures Celestials never deal in, and Tang, governor of the two Kwang provinces in which Canton is situated, President of the Board of War, was ordered to make war on the opium eaters. The said Tang executed the Son of Heaven's orders most effectually, as the following sentences from his proclamation will, we think, prove. "For the *seller of opium*, if he do not quickly forsake his vile calling, *decapitation will follow conviction*. For the *smoker of opium*, if he do not quickly renounce the habit, there will be *little chance of escape from strangulation*." Now, however tight these enactments may seem to draw the line, they still were confined to the Chinese alone, capitally in the first instance. The Emperor was perfectly right in making such enactments, and no doubt had read Vattel or some equally profound writer, since the policy of the Chinese has for ages proceeded on the principle of making all foreigners bow to the influence of their own country. We say no doubt he had read Vattel, because he clearly conceives that what he says to one he says to all. Now Vattel says as follows:—

"Even in the countries where every stranger freely enters, the sovereign is supposed to allow him access only upon this tacit condition, that he be subject to the laws; I mean the general laws made to maintain good order and which have no relation to the title of citizen, or of subject of the state. The public safety, the rights of the nation, and of the prince, necessarily require this condition, and the stranger tacitly submits to it, as soon as he enters the country, as he cannot presume upon having access upon any other footing. The empire has the right of command in the whole country, and the

laws are not confined to regulating the conduct of the citizens among themselves, but they determine what ought to be observed by all orders of people throughout the whole extent of the state. In virtue of this submission, the strangers who commit a fault ought to be punished *according to the laws of the country*."—Book ii. c. 8.

Still as foreigners are rather slow at understanding anything against their interest, and our own countrymen have a sort of independent feeling peculiar to Caucasian tribes, of making up their mind to act in every country as if they were the rulers, and not the ruled, these edicts were not obeyed. They had not studied Vattel, or were determined not to study anything opposed to their interest. The Emperor, commiserating their ignorance, decreed that in foreigners *the first offence should be visited with perpetual banishment, the second with death*. An American house, Messrs. Olyphant, announced their instant intention to comply with this regulation. This was on the 20th July last. As a matter of policy this was possibly quite right, but on the general feeling among merchants it would appear equally wrong. It certainly was mean-spirited, and the house merely resorted to it to obtain exclusive dealings with the Chinese. Captain Elliot and the English merchants refused to sign any bond to this effect. Their expulsion from Macao immediately followed, and they had previously vacated Canton. This took effect on the 26th August. The proceedings that led to the secession of the merchants from Canton were of the following character.

On the 26th February a native dealer in opium was found guilty and sentenced to be strangled. The place of execution selected was opposite the English factory. The same sentence had been attempted to be carried into execution in the previous year at the same spot, and had been frustrated with respect to the locality, but not with regard to the unhappy culprit. On this second occasion the hint was too palpable to be mistaken, and with strong protest on the part of the merchants the execution took place in the offensive spot, which certainly must have been rather unpleasant both in conscience and causality to our countrymen. Captain Elliot protested strongly against the spot selected for this purpose. At this unfortunate period, two boats passed the Custom House without submitting to the regulations made by our own commissioner, and only excused themselves on the ground of its being dark when they passed the Bogue. They might have stated their dark dealings, for they carried opium probably. At this juncture a new commissioner, Lin, arrived at Canton with extraordinary pow-

ers. His edict, on arrival, stated what is perfectly true, that China does not go to the rest of the world for productions, but that the rest of the world comes to her. It demanded the delivery of every particle of opium in the ships.

There can be no question raised, we apprehend, as to the right of any government to seize on a contraband article warehoused in its ports, but the Chinese went further, and demanded all in the ships. We think them right also in this view, since the seas of China and ports are as much under the laws of the country as the land. We therefore attach small force to objections from the extent of the seizure, and to arguments in favour of indemnity from that circumstance. The Chinese government further proceeded to denounce punishment to the same effect, as we have seen in the proclamation of the Governor of Canton, Tang. One sentence, as a specimen of Chinese political economy, we think ought not to be lost sight of by our government. "You who have travelled so far to conduct your commercial business, how is it that you are not yet alive to the great difference between the condition of vigorous exertion and that of vigorous repose—the wide difference between the power of the few and the many." The day after the publication of this edict, the Governor of Canton issued a notice that, "During the stay of the commissioner in Canton, and while the consequences of his investigation, both as to foreigners and natives, are yet uncertain, all foreign residents are forbidden to go to Macao." The immediate effect of this notice, with the announcement of Commissioner Lin, was, that the Hong merchants persuaded the Chamber of Commerce to give up 1073 chests of opium. The notice of detention of British subjects at Canton, immediately induced Captain Elliot, with great gallantry, but with still greater indiscretion, to come to Canton, by which step he only placed our chief commissioner as a "detenu."* The merchants thanked him for his conduct at a later period, and they had excellent reasons for so doing, but though we can conceive they had cause to be pleased with him, yet the fact of the highest British authority at Canton being a prisoner did not raise us in the eyes of the Chinese. A demonstration which seems so much the rage had not been ill placed at this moment. He published an extremely injudicious proclama-

tion, alluding to the execution of the Chinese in front of the factory, their warlike preparations, and the regulations respecting the detention of foreigners. The last was the only subject on which he ought to have touched. He remained protesting uselessly, unheard and unheeded.

Arrangements were then entered into for delivering up the opium, and on the 5th May the passage from Canton became again open, except for fourteen merchants, who remained hostages for the fulfilment of the treaty. On the 4th May, Captain Elliot proclaimed that he had determined to remove her majesty's factory from Canton, and requested the merchants to make the necessary preparations. On the 24th May he quitted, but not with the entire factory. On the 31st May an imperial edict from Peking directed that the opium should be destroyed, and it was so, though well worth 20,000,000 dollars. The conduct of the emperor in sacrificing for the good of his subjects so valuable a possession, needs no comment: it shows unquestionably that he was in earnest, though it is still asserted that he is not. We now proceed to detail the events that led to the expulsion from Macao. Captain Elliot continued to remain at Macao, without much variation of incidents, until the 7th July, when unhappily a party of sailors from the Carnatic and the Mangalore went on shore, and it appears, on our own showing, acted as sailors often do, heedlessly, but on this occasion even worse, for in an affray that ensued a Chinese named Lin-wei-he was killed. The Chinese laid the dead body on the beach, abreast the shipping, where it remained for some time. The imperial commissioner, whose eyes seem to have been wide open, dispatched two officers to investigate the transaction.

On the 20th July, as the opium trade remained in unabated vigour on the coast, a brig with this commodity was attacked by the junks, and commenced firing her guns at them, loaded with grape and canister, and killed in a short time fifty of the Chinese. All this is very fine if people will submit to it; but to violate their laws with impunity, and then to support infraction by infraction, would rouse the spirit of the quietest people upon earth. The result of the commissioner's investigation amounted to this, that Captain Elliot had been on shore with a ship-surgeon to attend the wounded Chinese; that the party notwithstanding died, and that hush money went to the relatives to be quiet. Captain Elliot, it is only fair to add, tried the offending parties: but the demand on the part of the Chinese commissioner to deliver up the murderers was not

* He was imprisoned seven weeks, with armed men parading day and night before his gates, and threatened with the privation of food, water, and life, it is said, but we cannot substantiate these latter points.

complied with, nor was life expiated by life. Lin's remarks are extremely shrewd: "On the one hand you will not give up the murderer, and further you will not consent to receive our edicts; you only wish most unreasonably to throw the blame on the Americans." Immediately after this, however, the American consul sent up a petition, stating vehemently that the charge was false. Again, "with your excuses and explanations about killing with *malice prepense*, and *killing by mistake*, and *supporting widows and orphans*, and such phrases, all these are so many evasions to screen and varnish over the real facts of the case. In all cases *Chinese who molest Europeans are banished*, and the obligation is reciprocal, so that to hush up murder by a bribe is a flagrant breach of the law." Lin concludes by prohibiting the supply of the ships with provisions until the murderer be given up. Captain Elliot, however, stoutly refused to give up the party or parties. A second proclamation followed on the 18th August, complaining that the murderer had not been given up, and holding all foreigners responsible. At this period intelligence arrived of the dreadful circumstances connected with the "Black Joke," which were well calculated, under existing misunderstandings, to excite alarm. This vessel was boarded on the night of the 17th on her way to Macao; her crew consisted of seven Lascars, the tindal, and a passenger, a Mr. Moss. The crew were cut down and thrown overboard, and the outrage on Mr. Moss was of the most horrible character; he was twice wounded in his attempts to keep the deck; he was then seized in the cabin, an attempt made to cut off one of his fingers, which he only saved by drawing off his ring, and giving it to his assailants; he was robbed of his watch, and while one held his ear, another with a sharp instrument cut it off, together with a large portion of the scalp on the left side of his head, and attempted by force to put it into his mouth and thrust it down his throat. The Chinamen then attempted to fire the vessel, but unsuccessfully, and the Black Joke was discovered by the Harriet and brought into Macao. Mr. Moss then gave his statement of all that had occurred, and solemnly declared that the Black Joke contained no opium. The British press in China, however—and our countrymen are seldom slow in their sympathies for each other—does not appear to consider this affair as perpetrated by the Chinese, though the tindal says they were Mandarin boats, but by pirates. If this be so, and it is not contradicted by Captain Elliot, the Chinese can hardly be held responsible for the affair.

It excited of course a dreadful state of alarm in the factory, and probably outrages were anticipated, but certainly none were perpetrated. In the meantime, as we have previously stated, Captain Elliot had arrived at the clear conviction of the offender or offenders, and the sentence that he pronounced for the murder was simply two years' imprisonment and a fine of 30*l*. He persisted in his refusal to give up the man, in complete contradiction to Vattel, in the passage extracted above; and to this ill-timed lenity hundreds have already fallen victims, and probably thousands more will suffer. Lin exasperated, and justly we must own, immediately proclaimed that all supplies should be withheld from the English, and issued orders (a strong measure) on the 31st August, to shoot all foreigners who ventured ashore, but to commit no assault on the ships. Captain Elliot determined on forcing a supply of provisions, and on September 11th issued a notice that he would place the river and port of Canton under blockade.

A second official notice announced that the blockade was withdrawn on the 16th, in hopes of a termination of the affairs by renewed negotiations. At this time a Spanish brig was attacked by the Chinese. The crew jumped overboard, but the Chinese picked them up and preserved their lives. The brig was burnt to the water's edge. It was evidently a mistake, and means were taken to prevent the recurrence, but the Chinese pleaded that the vessel was English, with opium on board, and that she had visited the coast in several points to dispose of her cargo. On the 15th, the body of a young English lad, but without any marks of violence, was found floating in Honkong bay. Captain Elliot seized upon this occurrence, and attempted to persuade the Chinese that this person was the murderer of Lin-wei-he. The negotiations at this time had a favourable aspect, but the opium traffic seems to have proceeded at as strong a pace as ever. The Chinese alternative at last arrived.

On the 25th October the commissioner insisted on two points as a *sine qua non*:—the delivering up the murderer of Lin-wei-he, and the signature of a bond of consent by the commanders of vessels, to trial by Chinese officers for offences to be declared capital. If these points were not complied with, all ships were to quit China in three days. The conditions were refused, and Captains Elliot and Smith withdrew to Tongkoo bay, to wait instructions from home and reinforcements. At that period a smuggling vessel and the Mandarin boats had an affair together, in which a boat was

sunk ; several other persons, and among them seven Chinese were sent back " with their tails cut off." Instructions were issued to the Chinese admiral, by Lin and Tang, to commence hostilities if the English ships did not put out to sea ; and they appear to have been directed to willing ears, for *Kwan the Admiral*, published the following proclamation, from which we extract, as extremely characteristic, his account of himself.

" Having received my instructions, I find that I, the admiral, rule over the whole of these seas, and my especial duty is to sweep them clean of the depraved and reprobate. Since then I have received the button of the Leader of the Army, I ought forthwith to appoint a day for the great gathering of my troops, but I, the said admiral, am descended from a family that dates as far back as the Han dynasty, (2000 years ago) ; the line of my forefathers sprang from Hotung. My ancestor was the deified Emperor Kwanfootze (commonly called the Mars of China.) Splendid and luminous was his fame, bright and dazzling the place of his imperial abode. Now I the said admiral fly like an arrow to recompense the goodness of my country, and tremblingly receive the admonitions of my great ancestor. I deal not in deceits and frauds, nor do I covet the bloody laurels of the butcher. Remembering that Elliot alone is the head and front of offence, and that probably the bulk of the foreigners have been intimidated or urged on by him, were I suddenly to bring my forces and commence the slaughter, I really fear the gem and the common stone would be burnt up together. Therefore it is that I again issue this proclamation, which proceeds from my very heart and bowels, that it may be promulgated abroad every where."

However absurd all this may appear to us, on the 3d November the two British ships of war (the *Volage* and the *Hyacinth*) going up in the face of the proclamation to the Bogue to deliver a *chop*, Kwan attacked them with twenty-nine of his war junks. Our ships were compelled, in self-defence, to fire. The unavoidable result was, that six war junks were sunk or blown up, and about 900 men killed. The English sustained no damage beyond a shot in the mainmast of one of their ships. Kwan behaved extremely well, but we regret to say the Celestials are probably deprived of the services of this descendant of their Mars, for he was severely wounded in the battle. This account, which bears date of November 27th, is the last received. Now taking a fair view of the facts, unblinded by cupidity and personal interests, can any thing be clearer than that blame rests with us in a far greater proportion than with the Chinese. Faults on both sides there may have been, but in our wisdom we are prepared to find the Chinese ignorant, prejudiced, unjust, but they have shown themselves neither of the three in the main.

We are also prepared to find the Chinese forming an undue estimate of us. Have we

not equally overlooked them? We have never entered into their national character. All our recent missions have been laughable failures. Lord Amherst was sent out to them in a capacity in which they never receive an envoy, and he failed in doing any thing in China, though we have to thank him for the Burmese War in India. He was, however, far better calculated to deal with the Chinese than the Hindoos, being of a phlegmatic, easy, nonchalant disposition, of which the following anecdote may give some notion. When the *Alceste* had struck, and was sinking by inches, etiquette prevented any person leaving the ship before the ambassador. Captain Maxwell sent to Lord Amherst, who was in his cabin, to request his appearance on deck. His lordship was shaving at the time the message was delivered, and stated his intention of being on deck shortly, and very quietly passed the razor over the unfinished side and proceeded to complete the operation. He then dressed himself with great precision, and made his appearance on the quarter-deck as unconcerned as if nothing was the matter and the ship had not been sinking inch after inch during his lengthened toilette. Now could this nobleman have brought his mind to treat his instructions with a " *benigna interpretatio*," he was just the sort of person to succeed with the imperturbable Chinese. But this nobleman always wanted powerful mental acquirement, and this great natural advantage stood him in no stead, and he left the British character lower than ever. Of him the Chinese wags observed there was a reason why he declined the ceremony of the *Kotou*, which consisted in giving the head three knocks on the ground before approaching the emperor. They said he was afraid of the *sound*. Next came Lord Napier. He was also determined to be something very conformable to English notions, but the direct reverse to Chinese. He would have, as Captain Bullock points out, (to whom we are greatly indebted for his able pamphlet,) *political rank*. He addressed the viceroy of Canton direct, completely violating, by this course, the great principle of the Chinese government, that no foreign political authority shall reside in the limits of the empire.

The Chinese treat us on the hypothesis of traders, and notice no other communication than that of a supercargo or *Tae-pan* ; and the line of this communication must be through the Hong merchants. A *Tae-pan* might as reasonably assume to be a *tea-pot*, as an envoy from this country take upon himself any other function than that described. The *Tae-pans* are there to replenish our tea-pots, and this is all they have to

do, and all that China wants of them. All this is quite different from other nations; it is vastly inconvenient: granted. But we seek the inconvenience, it does not seek us. *It has always been so.*

We should much like to know more of China than we do. We should like to have more insight into her literature; we should like to inspect her palæography; but China will not let us, for the best and wisest reasons, that India is before her eyes. She will, therefore, always entertain the same notion of us that Lord Keppel, we believe, did of the Scotch, "they are *excellent soles*, but terrible bad *upper leathers*." She is justified in this estimate on every footing of a wise and enlightened policy.

To Lord Napier succeeded Capt. Elliot. His blunders are the more intolerable, because his position was a legitimate position; though the first of its class, it was one that had become nearly intelligible to the Chinese. But Captain Elliot recklessly violated their laws in proceeding to Canton without a red permit. He became, in consequence, a prisoner, and a prisoner by proclamation, which sunk the English name still more than before, and was confined on just grounds as having violated Chinese law, by forcing a passage in his cutter. He further espouses the contraband side, which forms another reason of detention. He had no marines with him, on whose gallantry he could rely for protection as Lord Amherst did; for when preparations were made to force his excellency to comply with the Chinese regulations, the determined spirit of the captain of marines, though surrounded by millions, possibly saved him. And, to do Lord Amherst justice, he was ever sensible of the gallantry of that officer, Captain Cook, and rewarded it by taking him out to India as his aide-de-camp. But Captain Elliot remained a prisoner, and had to trust to Chinese lenity for his escape. His conduct exhibits one continuous violation of the principles of Chinese government.

The Chinese had digested, with some difficulty, the change from the East India Company to the English government, but they were at last prepared to view Captain Elliot, in the new position he occupied, as commissioner. He had then, we repeat, a far better position than either Lord Amherst or Lord Napier, and he has contrived to lose all these advantages; and, what is more, to obtain the protection and approval of the present cabinet, though mean enough to shrink from pecuniary responsibility. But as our information on the actual state of affairs in China is as correct as can be obtained, we feel no hesitation in stating, in

the face of Lord John Russell's declaration, that there is no ground for a Chinese war. The ministry may attempt to look big upon this question with unutterable mysteries, but they will be proved by the sequel to be unsound in policy, ill-informed in the real state of things, and heedlessly lavish of the blood and treasure of the country. But the Chinese commenced hostilities—even this point was brought about by the ill-timed conduct of our commissioner. He sails up with his entire force, after having received orders to quit the coast, by way of provocation and challenge to the Chinese admiral; and that officer, consulting his credit only, and not regarding his capability to punish the aggression, immediately attacked him. If Captain Elliot had withdrawn from China, the merchants would soon have placed matters on a right footing, and without any personal risk. If otherwise, matters must have strangely altered from the commencement. What evidence have we of their general demeanour from men conversant with trade in all directions? Mr. Jardine, the head partner in that house, on his health being drunk by the committee of merchants in Canton, in returning thanks, says:—

"I have been a long time in this country, and I have a few words to say in its favour: here we find our persons more effectually protected by laws than in many other parts of the East, or of the world. In China a foreigner can go to sleep with his windows open, without being in dread of either his life or property, which are well guarded by a most watchful and efficient police: but both are perilled with little or no protection in many other states: business is conducted with unexampled facility, and in general with singular good faith, though there are, of course, occasional exceptions, which only the more strikingly bear out my assertion. Neither would I omit the general courtesy of the Chinese in all their transactions with foreigners: these, and some other considerations, are the reasons that so many of us so oft revisit this country, and stay in it so long."

Here is a panegyric of the most extensive character, by an opium dealer, in one of the first British firms in China, and this as late as January 23d, 1839. But Lord John Russell talks largely of wrongs and reparation, and satisfaction, from the Chinese, and placing our commercial interests on a better footing by enforcing them at the cannon's mouth; as if any nation could be induced to enter with greater ardour and liking into fresh commercial relations by blowing to pieces its forts, sacking its cities, and butchering its unresisting inhabitants. But the drift of all this, we presume, is, that the forfeited opium is to be paid for by the Chinese. Neither the rules of law nor justice, nor privileges of nations, which differ mightily from House of Commons' privileges, for which

Lord John Russell is such a stickler, will permit this ; and then, last of all, an appeal will be sneakingly introduced to indemnify the Bombay merchants for the loss of their contraband article. But this will not do.

The conservatives are too strong to allow of this ; and even the Radicals, when money is talked of,

“fall away
Like water from him, never found again
But where they mean to sink him.”

■ In vain would the softest adjuration of his own Rockite bard be poured in the deaf ear of O'Connell :

“Oh, what was love made for, if 'tis not the same,
Through joy and through torments, through glory
and shame ;

I know not, I ask not, *if guilt's in that heart,*
I but know that I love thee, *whatever thou art !*”

He knows too well the overpowering influence of gold to think of supporting him on an unpopular money bill. Then again, as if dogged by the very dæmon of ill-fortune, the million-lived Cabrera seems destined to work up a little more peninsular agitation, and summons his chiefs in thousands, and they come when they are called. Here English gold and life cannot be sacrificed much longer. How profound, and yet how clear, compared to these pigmies, was the policy of the Duke of Wellington. All the present difficulties of the question were clearly traced out by him as early as 1834. He then stated fixed rules, declaring any deviation from them would be fatal to our intercourse with China. First, that no envoys should be sent with high sounding titles. Next, that though officers should be sent out with even plenary power, that they should not vary from the accustomed mode of communication, nor attempt to force the Chinese to alter their usual routine. He added, lastly, that *implicit obedience was to be paid to the laws of that country*, and that we were not to place ourselves in the light of legislators of China, but kindly permit that nation to legislate for itself. These principles were too stationary, fixed, old fashioned, and conservative, to hit the fancy of one whose delight has been to undo every thing, and to mark his desolating career by plenty of ruined villages without one single act of reparation. The hardship, too, of the present war upon ourselves is this, that we shall lose probably a wholesome and necessary article of English nutriment. Many of the recent vagaries have affected the purse, but here is something closer, affecting diet and health :

ἡξει Δωριακος πολεμος και λοιμος αμ' αυτω.
“A Chinese war, and plague on't, loss of tea.”
Next follows the cost of this extravaganza. Three sail of the line and four frigates, even

for a few years, with the land armament, cannot be put down under some millions, and it might all have been spared to the country. The only good resulting from this untoward event is the increase of the navy, which even the present economists are glad to embrace every pretext to extend, and which certainly needed increase. But to expect us to realise Captain Elliot's guarantee relative to the opium is absurd. The houses are well able to support the loss of 7828 chests of opium on whom it has fallen, though it may somewhat lower the future panegyrics on China from the house of Jardine and Co. Taking this firm, the largest sufferers on the surrender, and estimating each chest at 150*l.*, their loss amounts to upwards of one million sterling. This is unquestionably heavy, but what must have been the remunerative profits to compensate for the risk of this immense outlay ? 500 per cent. is stated to have been repeatedly received. If any house chooses to embark in the contraband trade to this extent, we maintain it is at their own risk ; and that our government is not entitled to place these persons on the same footing as, for example, the planter, who was secured by legislative enactment in the property he held in the slave. The cases are totally different : Chinese enactments were all against them, and no English law can protect the contraband merchant. But it will be said, and is, that the Chinese government connived at the opium traffic. All public edicts have invariably put it down, and though, as in Russia, great iniquities are perpetrated by the executives ; yet what a merchant has to consider is simply this, whether the positive edicts of a government are opposed to him or not. If they are, he trades at his own risk, and cannot look to his own country for support, when that country would treat him precisely in the same manner if he violated her fiscal regulations. Though we are far from vindicating the conduct of the present government in this matter, and conceive that it is scarce possible to imagine one more mean and faithless, yet we are still of opinion that, had they not upheld Captain Elliot throughout the whole affair, they were not called on to guarantee the indemnity of the opium dealers. But as they have generated and fostered their beautiful mannikin into its present dimensions, they are bound to maintain their own misshapen issue, and therefore to dishonour his bills for indemnity at the Treasury was a compromise of the national honour. But what can be said of persons like these, thus callous to the sense of shame, and who maintain themselves in office on the disgraceful tenure of

the hate of the Radicals to nobler statesmen, without espousing the feelings of even their supporters. One act, a fit pendent to the recent Devonport expulsions of parties who expressed any political sentiments opposite to their own, we chronicle with pain. It is so base, that we mourn over such degeneration even in foes. When Spring Rice was returned for Cambridge, principally by the exertions of Messrs. Peacock and Burcham, Fellows of Trinity, the former of whom received the Deanery of Ely, and the latter the office of Classical Examiner to the University of London, with promises of much more from his patron, which we believe have never been fulfilled, the ex-Chancellor took upon himself the character of a scientific Mæcenas. He was to do prodigies for the noble pursuits of his own university, Cambridge; and he procured for the Philosophical Society the grant of 300*l.* per annum from the government. While he remained member for the town, this was continued; but the instant he vacated that seat, the government withdrew its grant. Now what is this but making scientific support to depend upon political opinion, and laying down the fatal principle to which liberals invariably adhere, of evincing no liberality to any who differ from their political creed.

We shall no longer anticipate support for any scientific institution unless it have the stamp of Whig or Radical principles, while the present ministry holds office; and it is curious to see how they are at present trying to feel their way with the House upon the Opium Question, and attempting to slink out of their present obligations to support their own commissioner, or to wheedle him into favour with the House. But Sir James Graham, we entertain little doubt, will so pin them down to this question, that any attempt to run wide of the point will be entirely abortive, and the mean shuffling and political bungling which they have exhibited will appear under his dissection detected in even their pettiest processes. Before we conclude, we shall slightly advert to a few out of the numerous pamphlets before us. The first among these is from Mr. Warren, and a more mistaken production, or worse in temper and feeling, it is difficult to conceive. In it we hear of nothing but of Lord Napier, "that martyr to Chinese cruelty and insolence" and the expressions used are all of the most warlike and sanguinary tendency to the unfortunate Chinese. This gentleman seems to have lighted on the lion rather than the lamb in his precincts in the Temple, and to be a very incarnation of those days—

"When down came the Templars like Cedron in flood,
And dyed their long lances in Saracen blood.

We extract a few passages. "The bloated vain-glory and grandiloquence of the Chinese would probably collapse at the very first prick of British bayonets. Their flimsy armaments fly like chaff before the wind at the sight of one single British man-of-war, portentous object, making its appearance on their coasts cleared for action. It is not impossible that the roar of her first gun would fill Peking with tottering knees and pallid faces." Again, "Lin may find his celestial master's junks blown out of the water, and his forts crumbling into dust beneath the cannonading of his puny and despised opponents, all his ports blockaded, in short the shock may abate the fever which for centuries has inflated that strange people to such a pitch of presumption, and make them fit for intercourse with the civilized world. Their silver mines must forthwith disgorge the equivalent of the British merchandise which they have so presumptuously seized and wantonly destroyed; we shall teach them both the real extent of their own resources and of our own power." All this is, to say the least, grandiloquent enough, but will cost some pains to realize; and though the descent on Peking, the favourite notion of Mr. Warren, might produce some temporary effect, we should be glad to be informed what lasting beneficial results would follow from it. The reluctance also of the Chinese to part with bullion is participated in to the fullest extent by more civilized nations, who did not show their wisdom in suffering it to escape them; and we trust in future arrangements that, if they are so disposed, *barter* may be made the medium of intercourse, if they are jealous of parting with their silver. As to even the argument also urged by some parties, that the Chinese are growers of opium, and wish to put down the importation on that ground, we attach no value to it. It cannot be sold or used in the country without death to the buyer or consumer, which settles that point; and were it so, they have a right to oppose the importation of any check on native industry. Does England, for example, receive foreign corn to the injury of her own agriculturist, or foreign goods in preference to native manufacture? Even when this circumstance does almost unavoidably occur, as in the Saxony wool, what is the result? Utter ruin in that trade to all but a few large houses.

Equally futile is the objection raised by Mr. Warren with respect to the moral effects from the importation of opium into China. We are far from leaning to puritan-

ical exaggerations on this subject, and we know well that nothing better serves the purpose of the supporters of dram-drinking and opium importation than extravagant statements of the consequences attendant on these habits : but that evil of a most alarming character becomes generated in every country by such propensities, independent of the effect on the national strain, needs no demonstration to prove. Mr. Warren cites the celebrated instance of De Quincey, who took 8000 drops of laudanum daily, equivalent to 320 grains of opium, in proof that the indulgence in this habit is too costly to become general. Is this sagacious observer of life to be told then, that no sacrifice of money, fame, or life, appears too costly to the habitual dram-drinker? That all means are used to obtain the favourite poison, and that it is not measured by what a man can afford, but by what he can get? That any and all means are exerted to obtain it, and that the physical ill bears no proportion to the moral, however extensive; and that the opium-eater and the dram-drinker are parallel instances. Very few remarks will suffice for the other pamphlet before us, "Brief Observations respecting the pending Disputes with the Chinese." The writer confines himself to the advocacy of three points: Compensation for opium outside the port of Canton confiscated by the Chinese government; 2d, reparation for insults; 3d, commercial treaty, securing inviolability of the persons of British subjects. The first point we have already disposed of; the second might with more justice be demanded by the Chinese than ourselves; and the third no nation can concede to the offenders against its laws. This absurd pamphlet closes with the modest proposal, to seize on the island of Lantao for a permanent emporium; and the self-satisfied writer sets forth his protocol in the following terms: "You take my opium, I take your island *in return*; we are therefore *quits*." To which any Chinese might reasonably say, "I took your opium because you vended it against law; you take my island also against law; and you justify one infraction by another." What a British Solon this writer is! What an exquisite ally for the great protocol chief, and how short he cuts the matter, compared with his leader's long-winded arguments, which only arrive after all at fraudulent ends by a longer road. Next follows the "Opium Question, by a Barrister." From this we shall simply extract the following description of a government, premising, that the author evidently wants a change to relieve his eye; for by looking on the present too long, he has confused his notions of colour and complexion, and become jaundiced in aspect:

"All governments are dishonest as regards individuals. They will always avoid an equitable payment if the *law* is on their side; and they will not pay a legal debt if they can find a tolerable excuse for delay."

The last publication we shall consider out of this gathering host is by Mr. Lindsay, and it is entitled to more praise than it has yet obtained, though it has already reached a second edition. This gentleman states very sensibly the alarming position that our Eastern finances are fast assuming. Six millions of revenue are at stake; four millions in tea, and two in opium. He brings home to the viceroy of Canton the charge of trading in opium with four fifty-oared boats, through the agency of his son; and this we never doubted, since the Chinese officials are most corrupt; but he also declares that the *leading mercantile houses in Canton refused any participation direct or indirect in the traffic*. In common with ourselves, he censures Captain Elliot for the blockade of a day, and the affair at Cowloon. He also recommends an ambassador to be placed permanently at Peking.

We doubt whether, even after a battle or two, the Chinese will be induced to receive him, as it is clearly opposed to their entire policy. As our ears have been stunned with hardly any thing of late but complaints against the Hong merchants, and even the war has been ascribed to their agency, from an anxiety on their part to evade just payments to our countrymen; we extract the following anecdote relative to Chinese integrity, and as the party was personally known to the author, it may be fairly deemed authentic.

"The Chinese in question was a very respectable and intelligent silk merchant, but who at the same time frequently dealt in opium. In 1837 he had entered into contracts with our house for the delivery of silk in the ensuing year at a fixed price, and had received a considerable sum of money in advance; when the troubles began, my friend's name appeared in the governor's black list, as one of the leading opium dealers, and a large reward was offered for his apprehension. The season advanced, and we heard nothing of him, at the same time the price of silk had risen so, that he could not have fulfilled his contract save at a loss of full 15 per cent. Under these circumstances I confess we felt but little hope of seeing either our silk or our money. One night, however, in December, 1838, at the time when the persecution of all concerned in the opium trade was at its height, a Chinese called late at night, and said that my friend was in Canton, and wished to see me. I accordingly accompanied him to a small Chinese shop, where I found him disguised in the poorest garments. He said unto me, "I have come to Canton, at the risk of my life, to fulfil my contracts to you and to Messrs. ——. The silk which I promised you is in the hands of such a Chinese. You must make arrangements to pass it through a Hong merchant

without exposing me, for if seized my death is certain. Should my silk not prove equal to the quality I promised, my friend has more; you may select what you please, and I will pay the difference in value.' I confess I was much affected at this truly honourable conduct, and urged him in the strongest terms to lose no time in returning to his secure place of concealment, which was in a distant province. The next day, however, I saw the Chinese to whom he referred me, and received from him every bale of silk for which we had contracted, and which on examination proved of the very best quality. I am happy to say that my friend escaped from the clutches of the Chinese Inquisition, and was in perfect safety when I last heard of him. Such a trait of character confers honour both to the individual and to his country, and I firmly believe there are many such men to be found in China."

The nation, that produces men like this merchant, will find means, however despicable we may deem it now, ultimately to redeem itself from the position of receiving dictation from any power; and we are pleased to see the healthy spirit manifested towards the Chinese by Mr. Lindsay, and we shall only express our dissent from his opinions on one point, the indemnification of the merchants. The house of Lindsay, we perceive, surrendered 1146½ chests of opium, a loss to them of 172,000*l*. They naturally anticipate the indemnity promised by the commissioner, but we cannot think that this will be granted. Had Mr. Lindsay been in the position to have expressed his unbiassed opinion, he would probably have come to the same conclusion, but his judgment on this matter is of course warped by personal interest. And now that we have arrived on this "*vexata quæstio*," to this point it will naturally be demanded of us, what do we propose to remedy the difficulty? Do we, like Carlisle, on Chartism, come forward with a panacea. We do, and with a more efficient remedy for these troubles than education, to the deprivation of which he attributes all our present evils. We have

gone wrong, through the entire course of recent matters, and it is not improbable that a force may *now* be necessary to support our merchants; if so, let that force abstain from all offensive measures, until the merchants have tried the full extent of their power. If they manage matters right, the presence of an armament will be needless. But Captain Elliot, having completely compromised himself with the Chinese, should be instantly removed. All opium dealing strictly denounced under severe English punishments as well as Chinese, or else placed upon a legal footing, as a matter of fair trade. The British merchant ought in no country to be a contrabandist. We cannot think that these measures will prove unsuccessful; but should policy compel our government, justice cannot, to place our colony by force on the coast of China, we trust no further demonstration will be made than what is requisite to establish and to ensure its protection. Any frantic notion of holding China as we do India, we deprecate entirely. It would not be remunerative we are convinced, or realize to us even the advantages of our late position. A mutual good understanding will produce mutual benefits. But war must injure both countries, and destroy, rather than cement, commercial relations. However tempting this "*El Dorado*" may appear, we hope our people will show themselves above the lure offered to cupidity.

We feel confident that our national honour is not sunk so low as to need trophies from China to ennoble its strain, and we entertain a quiet expectancy that we shall receive the fragrant herb of her territory pure as it might be grasped by even the Pythagorean and assuredly ought by the Christian,—not polluted with worse than the blood of animals,—not matted together and defiled by the wholesale butchery of its peaceful cultivators.

MUSIC ABROAD AND AT HOME.

INDIA.

An intelligent amateur, an officer in the native cavalry, has mentioned to us a few peculiarities he has frequently observed in the Music of India. He describes the men's voices as being very high, similar to our counter-tenors; this is rendered more apparent when they all sing together, for then they strain with energy the upper and more shrill tones of their voices, not exactly in union, but nearly so; that the effect is disagreeable to our ears. The same gentleman has noticed that nasal quality in almost all the men's voices, which imparts such a peculiarly unmusical effect to their singing. The instrument most in use at the present day is their guitar. But the Fakeers, or holy men, in their processions, when they sing hymns to their Deity with loud shouts and energetic gesticulations, are accompanied by men beating the cymbals. It is rather a curious circumstance, that a great many of the songs of this country abound with the praise of drunkenness. These cannot be of Hindoo origin, as the ancient Hindoos never drank either wine or spirits.

Love songs are esteemed throughout India, and are even considered as pious hymns, being the acts of the god Chrishnu; the scenes of whose frolics were the villages of Gocool and Mu hoora, and the wilds of Vrindabun.

There is a species of hymn, the composition of Soordas, a blind poet and musician, which is of a moral tendency. Their war songs, in praise of valour, are called Curca. These are generally in the Rajpootannee tongue, and the songsters, whose profession it is to sing them, are called Dharees. They have also cradle-songs or hymns, called Palna. The Dhoorpud is the heroic song of Hindoostan; the style is very masculine and nearly devoid of studied ornamental flourishes. This style of composition had its origin from the time of Raja Man, of Gualier, who is considered as the father of Dhoorpud singers.

The word Pundit signifies a doctor of music, and in India is applied to those who profess to teach the theory of music, but do not engage in its practice.

Sir William Jones mentions the eighty-four modes of which the Hindoo system of

music is composed, but the superiority he claimed for these people over every other, on that account, was successfully refuted by the papers entitled "Oriental Music considered," in the late Quarterly Musical Magazine, vol. 7, page 457.

SPAIN.

A dramatical and musical journal is published at Madrid, entitled "Entriacto;" it is issued twice a-week, in half sheets, and each month delivers a lithograph, generally of some well-known performer, in theatrical costume, and an original play, with entrance to a reading-room—the whole for about 12s. per annum.

The theatres throughout Spain are nightly crowded. At Madrid, besides the two great theatres "Del Principe" and "De la Cruz," there are several smaller, "Bella Vista" and "Las Tres Musas;" also some partially public, as the Philharmonic Society, the Lyceum, the Conservatorium; the prison even has been hired as a theatre.

The management of the Principe has expended a large sum in the dresses and decorations of "Lucrezia Borgia," which has obtained great success.

The best living Spanish composers are Doyne of Salamanca, Nielfa of Madrid; Gomez and Cornicen are devoted to the opera. The first guitar performers are Sor, Oesoa, and Aguado. Church music is superior in Spain to most countries, vast sums being expended in order to secure perfect excellence in the sublime art.

MADRID.—Manuel Breton de los Herreros, the author of several comedies and other pieces has engaged a man who is under five feet in height, and weighs 450 Spanish lbs., for the performance of his *el hombre gordo*, "The Corpulent man," who is wheeled about from town to town.

NORWAY.

CHRISTIANA.—The celebrated composer Rudolph Willmers, a Prussian by birth, who met with such distinguished marks of approbation from the king of Denmark for his performances on the pianoforte, has been highly entertained at this town, at Bergen, and at Gottenburg. He is the composer of three operas and some sonnets, and is now

engaged on a new comic opera, the "Libretto" from the pen of a Danish poet.

ITALY.

The theatres here have nearly all commenced the Carnival season, under the most unfavourable auspices. Mercadante, after having failed at Milan, was unsuccessful at Venice, in his opera entitled "Emma;" and at Rome, Pacini produced a new work, "Furio Cammillo," which the united talents of Mad. Ungher and Donzelli could not entirely save from condemnation.

FLORENCE.—Prince Joseph Poniatowsky has written and composed an opera entitled "Giovanni da Brogia," brought out at the court theatre. The principal parts were performed by Prince Joseph, Prince Charles, his brother, and his lady the Princess Eliza.

TRIESTE.—In addition to the "Teatro Grande," two other theatres are now open, the "Teatro Mauroner" and the "Teatro Filo-dramatico," these houses are all nightly filled, and a new Opera-house will shortly be erected in the Piazza del Ponte Rosso, as the "Teatro Grande" is found much too small, being only capable of accommodating 1500 persons.

The Baron Cosenza is writing a new drama, entitled "Margherita Pusterla."

In the early ages, seven great cities claimed the honour of being Homer's birth place; at the present day, seven cities are contending for the honour of having given birth to the "Holy Cecilia:" these towns are Mayence, Chalons, Beauvais, Ravenna, Bologna, Lucca, and Rome, and all are situated in the three great musical countries, Italy, Germany, and France.

GERMANY.

BERLIN.—Mr. Hillmar, the palace musician, pensioned here, has presented the musical world with a new instrument, which he calls "Violalin,"* because by an extraordinary arrangement of the bridge and belly, he has brought the "C" string of the viola to the pitch of the violin.

Holtei is now giving a successful course of lectures on the drama: the subjects chosen are the "Iphigenia" of Euripides, "Ottoker" by Grillparzer, "Henry V." by Shakspeare, and "Mahomet" by Voltaire. Holter's declamation is most highly spoken of.

DUESSELDORF.—The Pope has been complimented with the dedication of a Mass to him, by our music director Schindler, and the director of the Roman Catholic Chapel was to have visited the Maestro, in order to send to Rome a second Mass composed by him.

LEIPZIG.—A new opera by Lorzing, "*Caramo, or the Fish-spearing*," has met with a good reception.

Ernst, the celebrated violinist, has been giving a series of concerts at which he has

been received with an enthusiasm unprecedented since the performances of the great Paganini.

Meyerbeer, who has been residing at Baden-Baden, has now completed a grand musical festive piece, composed in honour of the Queen of England's nuptials. This composition he intends bringing with him to London, and will superintend its production.

ALTENBURG.—On the anniversary of the Reformation, the hymn to "Holy Cecilia," composed by the Crown Prince of Hanover, was brought forward in the palace, by Ernst Schulz, with the chorus, and pleased the court so much that a second performance was ordered.

Spohr has completed another oratorio, "*The Fall of Babylon*," which will be performed by an orchestra of 800 voices and instruments, at Cassel, on 16th (April) inst.

SAXE-GOTHA.—The ducal family of Saxe-Cobourg-Gotha contains several distinguished musicians. The two princes, Albert and Ernest, are very efficient performers on the pianoforte; the musical compositions of the former possess considerable sweetness and melody. The Duchess of Kent is also a very excellent pianist; and King Leopold is a superior performer on the violin. The Princess Victoria, who is about to be united to the Duke de Nemours, possesses considerable musical talent; her brother the King Consort of Portugal, has made painting his study; some of his sketches have been highly spoken of.

Leopold Schefer's new opera, entitled "*Hekuba*," is proceeding rapidly towards completion; the libretto is from his own pen.

WEIMAR.—Ulrich has a new opera in a state of great forwardness for the Theatre Royal.

Kastner, the author of several French works on music, has completed a new opera for the German stage, the libretto from the pen of Dr. Schilling. This opera will be brought out at Stuttgart, Cassel, and Carlsruhe.

FRANCE.

PARIS.—"The Chaste Susannah," an opera in four acts, was brought out at the Theatre de la Renaissance, composed by M. Monpou. This is a subject assuredly more adapted for an oratorio than an opera, for if there is to be any serious belief in the Scriptures, such things are unfit for theatrical display, and must shock the feelings of right-minded persons whenever exhibited. It is true that our volatile neighbours, accustomed from childhood to frequent theatres on Sundays,* do not think so severely on such derogations as we more sober English-

* This is certainly a union of the violin and the viola.

* See the excellent strictures on this subject by *Nimrod* in the *New Monthly Magazine*, January, 1840.

men would revolt at; nay, they can go so far as to tolerate an opera in which the Deity is represented enthroned, and Angels singing chorussed hymns to his praise! One of the first professors in this country witnessed this display in Paris some years ago. What we have said is merely to caution managers (in the present rage for transplanting French music to our shores) to be careful not to attempt such as M. Monpou's opera.

It is announced in the *Journal d'Artiste*, that a series of unpublished letters by the celebrated writer J. J. Rousseau have been discovered in an old Chateau in Normandy. They appear to relate chiefly to scientific and musical subjects. As a musical writer of profound views and elevated taste, few who have written on this art have equalled the philosophical Rousseau.

At the *Théâtre Renaissance* a comic operatic sketch has been produced under the title of "*Le Mari de la Fauvette*," composed by M. Villeneuve; it was most successful.

Donizetti's new opera, the "*Martyrs*," has been produced at the opera. Great attention was paid by M. Duponchel to the *mise en scène* of this work, to which he attaches much importance. Madlle. Nathalie Fitzjames will appear shortly at the *Académie*, in the ballet-opera, "*Le Dieu et la Bayadère*," both as a singer and dancer.

Donizetti's new opera of "*L'Ange de la Nizéda*" will be immediately produced, and will be followed by Benedict's new opera.

Lemoine has recently published two interesting musical works: "*Traité d'Harmonie et d'Accompagnement*," by Fétis, and "*Méthode de Chant et de Vocalisation*," by M. Garcia, brother of Malibran and Pauline Garcia; the latter will shortly be united to M. Viardot, the director of the Italian Opera of Paris.

A new opera by M. Halevy, the libretto by Scribe, has been produced at the *Académie Royale*. It is called "*Le Drapier*." The costume and *mise en scène* are magnificent, but the music is of unequal merit.

RUSSIA.

ST. PETERSBURG.—Taglioni continues to engross the whole attention of this imperial capital. Adam's new ballet of "*The Pirate*" has been completely successful, and this incomparable dancer has been showered with flowers. M. Laporte, of the Italian Opera of London, has been offering her very high terms, but hitherto without success. One of the little theatres at St. Petersburg has brought out a burlesque entitled "*The spurious Taglioni*."

The emperor, in order to promote the study of native music, has offered premiums for the production of operas by Russian composers; and societies for the diffusion

of musical knowledge have been formed here and at Moscow.

AMERICA.

Mr. Charles Kean will probably leave New York on 1st April, and may be expected in London towards the end of that month. Mr. Wilson and Miss Shirreff have accepted another short engagement at the Park Theatre, and are not likely to quit the New World before the middle of June. Mrs. Fitzwilliam continues to draw crowded houses in every town in the States which she visits.

LONDON.

Italian Opera.—The opera season has commenced with Torquato Tasso and Beatrice di Tenda for Madame Persiani. Coletti, the new basso, is a beautiful singer of the true school of expression, with a voice as flexible as any tenor. Let us hope M. Laporte will employ such talent as he is now in possession of in better operas than Donizetti's flimsy pieces. Don Giovanni, Figaro, &c. should be revived immediately.

Covent Garden Theatre, under the fostering care of royalty, continues its brilliant career. The fair lessee is indeed a most indefatigable caterer for the amusement of her patrons. Comedy is represented in her brightest dress, every character being well filled by the aid of this unrivalled company. "*The Rivals*," Colley Cibber's "*Double Gallant*," "*The School for Scandal*," and Mrs. Centlivre's "*Wonder*," have each been produced with characteristic splendour. Jolly's new opera of Mabel was justly condemned on its first representation, being in truth a most nauseous piece of fiddling. But the new opera, compiled from the musical compositions of H. R. Highness Prince Albert, which will shortly be produced at this theatre, must prove a very attractive feature. Some of the songs (which we have heard) are of exquisite sweetness and full of melody, and will no doubt soon become exceedingly popular. Leigh Hunt's new play of the "*Legend of Florence*," and Shakspeare's "*Romeo and Juliet*," have been produced with characteristic splendour, attesting the spirit, taste and activity, of the management.

Drury Lane opened with a quotation from our immortal bard—"one touch of nature makes the whole world kin"—but in both the management and the company that "one touch" was wanting; and the lessee made a miserable failure, which neither royalty nor the great tragedian for a few nights could possibly avert. It is confidently stated that Mr. Beale, of the musical firm of Cramer & Co., has taken the theatre for the next season, and if the management is to be placed in the hands of Benedict there will be no longer any reason to com-

plain of the decline of the national musical drama.

The Haymarket Theatre now occupies that position in the dramatic world which old Drury held and maintained some ten years since. And this is chiefly owing to the unceasing exertions of Mr. Webster, under whose guidance this theatre has been gradually rising in the public estimation until it has arrived at the prominent position which it now holds. The present season has commenced most auspiciously, for her Majesty is, and will be, a frequent visitor while such names as Macready, Power, Ward, Phelps, Charles Kean, Helen Faucit, Warner, Glover, and Priscilla Horton, are combined in one company, and these are attractions which must prove sufficient to fill the house every night.

English Opera House.—The Concerts à la Musard continue to attract full and fashionable attendances every evening. As we predicted, when those concerts were first established, they have become as necessary for the pleasures and pastimes of this country as our theatres. And when we assert that a larger portion of the first musical talent of this country is to be found every evening within the walls of the English Opera House than is to be met with elsewhere, it is evident that this establishment ought to (and we are happy to say it does) receive the patronage of the musical public.

Olympic.—This popular little theatre, under the guardianship of Mr. Butler, is constantly varying its light entertainments, with the one exception of "The Ladies' Club," which appears permanently established at this house, being attended at every meeting by a large number of visitors, who appear highly amused at the lectures. The chairwoman, lessee, and members of the council, certainly deserve a vote of thanks. Frederick Vining is another valuable addition to this little company.

The other minors continue their "horrible" career, striving like our neighbours in France, to excite sympathy for the lowest and most worthless characters recorded in the annals of crime, and engendering feelings in the breasts of the "theatrical gods" which will ultimately assist to fill our prisons.

The **PHILHARMONIC SOCIETY** having abolished their last season's arrangement of allowing non-subscribers to come in with guinea tickets, we are to infer they intend this campaign shall be distinguished from the later seasons by great activity in the direction, new symphonies by Mehul, Kalliwoda, Spohr, Berlioz, &c., and the permanent engagement of a first-rate vocal choir to bear the weight of the concerted vocal music which they are supposed to be preparing. These are critical times: they must be up and doing. The public will no longer tolerate an expensive instrumental concert when cheap and excellent ones are so numerous. They have had more than "Three Warnings," and therefore now the sub-

scribers and the public do expect a complete renovation in the vocal department, of which their first concert has not certainly given any strong indication.

The "**Societa Armonica**" hold their first concert, at the great Concert Room of her Majesty's Theatre, on the 30th inst. The engagements they have entered into leave no doubt of their meeting with their usual success.

The Ancient Concerts have commenced. The first was honoured with the presence of the two Queens. Her Majesty and Prince Albert expressed themselves highly pleased with the selection. The first and second concerts were both excellent in quality and execution. The programme of the latter, under the direction of the Archbishop of York, contained some superior revivals.

The Sacred Harmonic Society has been attracting universal attention. It is impossible to convey any idea of the splendid performances of this very excellent Society. "Israel in Egypt" and "Saul" have been performed by the aid of their vast choral resources, in such a masterly style that they have completely electrified the thousands who throng into Exeter Hall on every performance.

A committee of management are preparing a musical treat for the 102d anniversary festival of the Royal Society of Musicians, on the 10th April; several eminent vocalists have tendered their services on the occasion. His Royal Highness the Duke of Cambridge has consented to preside.

The City Quartett Concerts have on each performance been fully and fashionably attended. Messrs. Willy, Joseph Bannister, Hill, Hausmann, and C. Severn, have drawn all the civic amateurs around them, and excited a spirit of musical emulation among our sober citizens highly gratifying. The second, third, and fourth concerts were rather heavy from the want of sufficient variety in the selection. The most attractive quartett was the opening piece of the second part, on the 16th inst., Mozart's quartetto in G minor, for piano, violin, viola, and violoncello, which was performed in a most masterly manner by Messrs. Cipraini, Potter, Willy, Hill, and Hausmann.

The **Choremusicon**.—This very ingenious instrument resembles an upright pianoforte; it has two sets of keys, an octave of pedals with clarionet, flageolet, flute, and bassoon stops, also a drum and triangle, and is capable of giving a great variety of sounds; it is intended principally for the performance of quadrilles and waltzes.

A young lady only ten years of age, a Miss Roeckel, niece to the composer Hummel, has been attracting considerable attention in the provinces by her extraordinary performances on the pianoforte.

The following remarks are from the pen of a correspondent of the "**Musical Journal**,"

the only musical periodical of any value in this country :—

"It is really gratifying to find, in the person of a prince of the royal blood, no less eminent musical qualities than those which distinguish her Majesty's consort. H. R. H. Prince George of Cumberland, the Crown Prince of Hanover, has just published a work, entitled "*Ideen und Betrachtungen über die Eigenschaften der Musik*," (Ideas and Views respecting the Properties of Music). In this work all the soul of the youthful composer is poured forth; his preface is full of enthusiastic praise of music, and he evinces, in almost every page, the most ardent love for the 'sublime science.'

"From my early youth," says Prince George, 'I have applied myself with the most intense desire to make the science of music my study and my amusement, and it has ever proved an invaluable companion, as well as an unceasing comforter through life, from the variety of its inexhaustible ideas. The more I learned, the more closely its poetry wove itself around my soul. Music is a language of sounds—it speaks to us through all our thoughts and feelings.'

"We now come to his compositions; they are '*Sechs Gedichte, von Ernst Schulze, in Musik gesetzt, von S. k. H. dem Kronprinzen von Hannover*.' (Six Poems by E. Schulze, composed and arranged for four voices, by the Crown Prince of Hanover, entitled '*The Star of Love*,' '*Stern der Liebe*;' '*Serenade to Cecilia*,' '*Nachtgruss an Cæcilie*;' '*The Parting*,' '*Abschied*;' '*Ode to Spring*,' '*Fruehlingslied*;' '*Love's Complaint*,' '*Liebesklage*;' and '*Hunting Song*,' '*Jaegerlied*.'

"'*Vorwaerts! Gedicht v. Uhland*,' Onward, a Poem, by Uhland; the music composed and arranged for four voices by H. R. H. the Crown Prince of Hanover.

"And '*Vier Gedichte von Schiller*,' Four Poems by Schiller; the music composed and arranged by H. R. H. the Crown Prince of Hanover. These four poems are—'*To Emma*,' '*An Emma*;' '*The Youth at the Rivulet*,' '*Der Jungling am Bach*;' '*Ardent Desires*,' '*Schnsucht*;' '*Rapture with Laura*,' '*Entzückung an Laura*.'

"In conclusion, I cannot do better than close this brief notice in the words of the prince, whose works will, I trust, soon become familiar to the English nation, to whom he is indeed an ornament, and one whom they may justly claim as their own: 'It is an unpardonable offence towards this divine science to consider it either as a vehicle pour passer le temps; a stimulus to the thoughtless dance, or to be used as a subject of conversation, in which a superficial judgment is allowed to pass its decision on performers and performances, because fashion and custom proclaim it an elegant accomplishment; instead of seeking to discover what really is to be found in the inestimable richness and purity of the divine science of music, viz. a manifest improvement in the finer feelings, refinement in the manners,

consolation in affliction, and hope for futurity, with true and faithful firmness, in faith and in love.'

Thalberg.—This extraordinary pianist was recently travelling through England giving concerts, and meeting every where with great success. In a conversation we had lately with an old professor, whose knowledge of the art is second to none in Europe, the question was asked, "Is Thalberg a great musician?" Our friend said, "Decidedly not. He is a gigantic mechanician; introduces great variety and energy into his playing, but no other decided impression than wonder is left on the mind of people with true musical feeling after hearing him. He is not a Fugulist; does not excel in the Adagio; there is not the exquisite sensibility of John Cramer, the imagination and learning of Mendelssohn, or the majestic solidity of Clementi. Thalberg writes and plays too much; he has not time to think. The very high mechanical construction of his pieces redundant with every sort of difficulty, renders them unfit to produce their proper effect under the hands of other pianists as we find now during his lifetime. How then can it be expected that proper justice should be done to them at any future time? Therefore it is not too much to say that his compositions will die with him."

The Crucifixion.—Oratorio by Louis Spohr. English Translation. London.—Spohr was brought over to superintend this oratorio at the Norwich Festival. The opinion of the best judges in England declare this work to have been a failure. The chorusses here and there are fine, but the chromatic elaboration of the solos, and the dreadful heaviness resulting from the want of dramatic characters or personages in the oratorio, although the instrumentation is (like that of all this composer's works) very beautiful, yet could not redeem the lack of interest felt throughout the performance. We quote the following passage from the "*Monthly Chronicle*" for October, which appears to have been written by some partisan of Mr. Professor Taylor's:—"Spohr came over here, expecting nothing but his bare expenses. The committee, with gentlemanly feeling, and not to be outdone in generosity, sent him back with 150*l*. Such a spirit in the intercourse with a man of genius, does honour to the national character, and makes one proud of being an Englishman!" Indeed! this is a very extraordinary pride then lately sprung up amongst us. The English in general are not so stingy in rewarding foreigners of great talent. Rossini when over here asked and obtained 50 guineas for singing at noblemen's houses, with Signora Colbran; Rubini, 30 guineas; Malibran, 50 guineas; and Weber 50 guineas for promenading the late Duchess of St. Alban's rooms on a rout night. Yet the Norwich committee are here made to boast in the most vulgar manner of enticing Spohr over expecting nothing but his bare expenses!

Life of Madame Malibran. By the Countess Merlin. 2 vols., 8vo. London, 1839. It seems to be the fate of most of the greatly talented persons of every age, to be much misunderstood in their real feelings, which being naturally of an excitable nature, and therefore liable to eccentricity, very often disturb the plodding serenity of the herd of mankind, whose views, confined to money-making, eating, drinking, and enjoying themselves, cannot readily be brought to conceive how enthusiasm of any kind is engendered. Madame Malibran was a genius, almost a universal one, and from the advantage of a long acquaintance with that extraordinary woman, we can assure the readers of the Countess Merlin's book (which is well and amusingly written), that the anecdotes of her liberality and kindness of heart are by no means exaggerated; we could supply of our own knowledge many more. It is not true as stated by the reviewer of this book in the *New Monthly Magazine*, "That had she lived to complete her career in the ordinary way, she would soon have been forgotten." With all her great and varied talent, which was of a nature to throw every other into the shade that came near it, there was a constant playfulness, kindness and attention to the feelings of all around her, which has not to this day been forgotten by any who knew her.

"Evening," a Canzonet. The melody from a German song by Prince Albert, arranged to English words by F. W. Horncastle, Esq., of her Majesty's Chapel Royal. This Canzonet is full of melody, and has been most prettily and judiciously arranged.

One of the prettiest serenades which has appeared for many years is "*Vieni al Bosco, Notturmo*," due voci soprani, composta da F. W. Horncastle, Esq., and published by Mills, of Bond Street.

ACOUSTICS.

The last volume of the "*Records of new Discoveries and Inventions*," published in Paris, contains two notes on some experiments of M. Cagniard Latour, who does not cease to devote himself with success to researches in Acoustics. We transcribe some portion of these notes, which we imagine will be interesting to such of our readers as may be occupied in this branch of musical science.

I. On Sound.

Mr. Savart has discovered, that when a column of air vibrates in a column of a flute with fibrous partitions, it produces a graver sound than that of a flute with rigid partitions. Performers on the flute have been led to remark that this instrument resounds in general more easily when its interior parts are thoroughly damped with water. These and other facts have suggested to M. C. Latour the idea of examining if a column of air, which is contained in a well, would be more or less proper for making the sounds re-

sound, according to whether the well contained water or not; and he believes that the resonance would be more marked in the first case than in the last.

He has also remarked that the sounds produced under the arch of a stone bridge resound more, when the foundation upon which the pillars of the arch rest is covered with water, than when it is not. Latterly he has had an opportunity of being able more fully to appreciate the influence that the surface of the water has upon the resonance of the air, by observing, in an estate in the suburbs of Chartres, two wells of similar size and construction: one, of which the bottom had been covered with water for many years, had acquired an extraordinary degree of resonant power, while the contrary is the case with the other, which contains no water. M. Cagniard Latour observes besides, that in the first well the sounds were prolonged a certain time after they had ceased to be produced, which would give reason to suppose, that water, on account of its polished surface, is as favourable a medium for the reflection of sound, as it has been long proved to be for light. In order to put this to the test, he proposes to have the interior surface of the body of the violin made polished by the application of a very glossy description of varnish, by these means to discover whether the sonorous qualities of the instrument will acquire an appreciable increase of power.

II. On the Vibration of Solid Bodies.

M. Cagniard Latour has made experiments with the view of ascertaining the modifications which the resonant power of solid bodies undergoes under certain circumstances. The principal facts which he has elicited are the following:

1st. The longitudinal vibrations of a tempered steel wire were of a deeper tone than those of a wire of similar length which had not been tempered; the amalgam of which cymbals are made and iron give precisely the same results.

2dly. The transverse sound of a bar of tempered steel becomes higher by the annealing it has received; it is the same with respect to the metal of cymbals which has been tempered.

3dly. The longitudinal vibrations of a wormed thread of steel give the same note as those of a tempered wire of the same length; brass and silver produce similar results. On the subject of these facts, the author remarks that they merit some attention on the part of those learned in physics, because they would seem to show that the mere variations of density in a metal have no influence over the rapidity of its longitudinal vibrations, and that, in consequence, sounds are propagated in solid bodies in the same manner; since, as is well known, the rapidity of the sound in this fluid is independent of the barometric pressure.

4thly. Lastly, the sonorous power of a bar of copper in a screw form is much diminished by annealing; but the contrary holds good with regard to silver; that is to say,

that if a wormed rod of this metal be annealed, it is rendered sensibly more resonant by the process. The same effect takes place in the case of a wormed bar of zinc, which, when it has been annealed by heating till the lead it contains has been fused, acquires the quality of resounding much longer after the sounds are produced, than it did before the process had taken place; the sound elicited is also of a higher tone.

The experiments are but modifications of Lord Bacon's, as the following extract will show:

"It hath been tried, that a pipe a little

moistened on the inside, but yet so as there be no drops left, maketh a more solemn sound than if the pipe were dry; but yet with a sweet degree of sibilation or purling. The cause is, for that all things porous being superficially wet, and, as it were, between dry and wet, became a little more even and smooth; but the purling which must needs proceed of inequality, I take to be bred between the smoothness of the inward surface of the pipe which is wet, and the rest of the wood of the pipe unto which the wet cometh not."—See p. 121, vol. iv. of Basil Montague's Edition of Lord Bacon's Works.

MISCELLANEOUS LITERARY NOTICES.

FRANCE.

One of the sweetest of French living poets is Madame Desbordes Valmore, who first attracted attention in France, Germany, and England, by a collection of poems, entitled "Pauvres Fleurs." Her life having been shaded with miseries and disappointments, it has infused that tinge of sadness and melancholy which characterizes the writings of the sweet authoress. There are other poets in France who sing louder and more skilfully, but there are none who breathe such gentle, tender, and inspiring lays as Madame Desbordes Valmore.

M. Charles, of Chartres, Member of the Institut, is preparing for the press a very extensive History of Arithmetic; in which the author intends to enter at length into the question of Mr. Halliwill's theory of the Boetian Contractions recently discussed before the French Institute, by M. Charles and M. Libri.

A work embracing the information of a hand-book, and embellished with fifty engravings, entitled "Voyage de Paris à Constantinople par bateau à vapeur," has appeared at Paris. This work must prove invaluable to the southern traveller.

GERMANY.

A work highly interesting to the geologist is announced by Hermann von Meyer, entitled "Fauna der Vorwelt." This work will treat of fossil bones of Pachydermata, (Mastodon, Rhinoceros, Palæotherium, Dinotherium, Tapir, Microtherium, &c.) Ruminantia, (Palæomeryx, Orygotherium, &c.) Rodentia, (Lagomys Oeningensis,) Carnivora, (Harpagodon, Pachyodon, &c.) Tortoises, Sauriens, Frogs and Birds, which have been found in beds of Lignite, or Brown Coal, in Switzerland, and in other deposits of Molasse in this country, as well as in the pits of pisolite iron ore of Möskirch, in the calcareous marl near Oeningen, the gypsum near Hohenhöven, in the strata near Weisenau, and in other tertiary strata; of the skeleton parts of the marine Mammalia; of remains of Sauriens, Tortoises, and Birds, from the

cretaceous group, (in the canton of Glaris, &c.) of the Plateosaurus from the Keuper; of the teeth of the Ischyrodon; of Sauriens and Tortoises from the famous formation of the lithographic limestone of Solenhofen; and of other fossil vertebrated animals.

As to the present eager pursuit of historical investigations about the constitution of the earth and the development of its organic types of animal life, there can be no better evidence than the remains of animals in the crust of the earth, amongst which the vertebrated animals are no doubt of the greatest importance. Thus, if we add the creatures produced by the earth in a primitive age to the number at present only, we are able to estimate the riches of the whole creation, and to explain the alternations resulting from the sublime laws of nature. The publication of a work like this, containing anatomical and geological discoveries of a former world, will therefore be readily promoted.

The work will appear in several numbers, the price of which will be calculated as is customary with such works, after the number of sheets in German, printed in Latin letters in 4to, and according to the number of tables in folio, with plates.

BERLIN.—The University has presented Professor Räumer with the honorary diploma of Doctor of Laws.

LEIPZIG.—Dr. Hermann Brockhaus, the son of the well-known bookseller of that name, who has for some time been studying the East Indian languages, has been called to the University of Jena, where an appointment has been accepted by him. He has lately published an edition of the "Kata-Sakrit Sagara," a collection of Sanskrit Fables and Legends, with a German translation.

Mohnicke, the best German translator of the "Frithiof's Saga," has just announced a complete translation of all Tegnér's poems, together with his life, by Franzen, and an introduction to the "Frithiof's Saga" by the translator.

Dr. Hitzig, of Berlin, has been induced to

publish a new journal in that town, devoted principally to the rights of authors and publishers.

HAARLEM.—At the annual meeting of the Society of Arts and Sciences, the following honorary members were elected:—Babbage, Lyell and Murchison, of London; Ehrenberg and Mitscherlich, in Berlin; Bone, Beaumont, and Prevost, in Vienna.

BRESLAU.—Oriental literature has sustained a heavy loss in Dr. Tobias Habicht, the translator and editor of the Arabian Nights, generally known as the "Breslau Edition," and universally esteemed by all Arabic scholars.

ERLANGEN.—The lamented death of Dr. Hermann Olshausen, author of the Commentary to the New Testament, has created a vacancy in the Theological faculty, which it is understood is to be filled in future by two younger professors.

The third centenary of the discovery of printing will be celebrated in the ensuing summer in all the principal towns of Germany. At Leipzig preparations are making for a magnificent display; the morning of the 24th June will be ushered in with the ringing of bells; at eight o'clock the populace will assemble at the principal churches to give thanks; and at ten o'clock the various deputations and representative bodies are to form into procession, parading the principal streets, and arriving at the market-place, where an immense vocal and instrumental choir will deliver a selection of songs and other musical effusions, composed for this interesting occasion. At three o'clock the company are to dine in the Augustusplatz, where accommodation will be provided for 3000 persons. In the evening the city will be generally illuminated. On the 25th, a meeting of the literati, authors, printers, booksellers and publishers will be held in the market-place; and at three o'clock the grand oratorio, composed in celebration of this event by Dr. Mendelssohn Bartholdy, will be performed in the cathedral church. A grand ball will conclude the evening's amusements. The 26th June is to be devoted to the festivities of the people, accompanied with fire-works and torch-light processions.

At Hamburg, Berlin, Copenhagen, Mayence, Cologne, and Weimar, committees have been formed for the purpose of taking into consideration the best means of celebrating the Third Centenary of the Discovery of Printing, in these cities on the 24th of June. Illuminations will be general throughout Germany on that extraordinary occasion.

The celebrated naturalist, Dr. Blumenbach, died at Göttingen on the 22d of January. He was born at Gotha in 1752.

The "Blätter für Literarische Unterhaltung," the "Morgenblatt," and the "Litterarischer Anzeiger," are the three best literary journals published in Germany, and each enjoys a large and influential circulation.

The Society of Knowledge of Upper Lu-

satia consists of 125 general and 126 corresponding members, possessing a valuable collection of coins and minerals, and a library of upwards of 30,000 volumes. They have published the first portion of the "Scriptores Rerum Lusaticarum," containing the chronicles of Johann von Guben, the Gorlitzian annals of Bereith von Geuterbog; a Calendarium Necrologicum of the Minoritan convent at Gorlitz, the annals of the Francesconian convent, and the history of the Hussite war in Silesia and Lusatia, by Martin von Bolkenhain. The first number of the second part has also appeared, containing the first portion of the annals of the senate of Gorlitz, from 1487 to 1495.

HOLLAND.

AMSTERDAM.—Dutch literature continues at a low ebb; the only works which now appear are on political or religious subjects, and a few works on jurisprudence; but the penal laws are in a very confused state, arising from the circumstance of the judges being appointed for life, and cannot be removed; they are perhaps less responsible than any other judges in Europe. There is but one Dutch magazine on Foreign literature.

ITALY.

The following are among the most recent publications which have appeared in Italy:—A "Dizionario di Conversazione"—Conversations Lexicon—is proceeding slowly under the direction of the historian Carrer. Gallerini, the principal bookseller at Rome, is publishing a new edition of the collected works of Angelo Maria Ricci. Campiglio has completed his historical romance "Elena della Torre," and M. Moroni has issued his "Dizionario enciclopedico della vita pubblica e privata de pontefici." Guiseppe Sacchi has published a volume of moral and historical tales, "Racconti morali e storici." The fifth and last volume of "Il milite romano" (The Roman Soldier), by Colleoni, has appeared. A "Dizionario biografico universale," and a "Panlessico" in six languages, have appeared at Florence, and at Bologna a translation of J. J. Rousseau's "Dictionnaire de la Musique." At Turin, Lissoni has republished Laurent's History of Napoleon, with Vernet's illustrations. The poet Cæsare Perini has gone to Oporto to write four dramas founded on Portuguese history. Valpi, of Milan, has announced a "Dizionario universale artistico."

Of public works, the roads between Trieste and the province of Messina, Catania, and Salerno, are undergoing great and important repairs. The king's palace at Naples is about to be restored, and the railroad between Naples and Castellamare is nearly completed, and several lofty mountains are to be connected by hand-bridges. The harbour of Leghorn is to be enlarged and improved.

FLORENCE. The progress of literature and the publication of literary works throughout

Italy continues unimpeded. The second volume of "*Relazioni degli Ambasciatori Veneti*," containing the history of Marco Foscarelli, and all the events of that remarkable period, from 1527 to 1530; and a comprehensive notice of the state of the court and country under Cosmus the First, 1561, has appeared, to which is appended a very interesting notice of Savoy during the same period (1561). The first volume of Dr. Gaye's work, entitled "*Carteggio inedito d'Artisti del Secolo XIV. XV. XVI.*," published and illustrated with documents pure inediti," will shortly appear. This work, comprising a period of from 1225 to 1500, contains a mass of information of vast value, and the publication is anxiously looked for by the literati of Italy; fac-similes and autographs of artists and celebrated men of those ages will form an interesting addition to the work.

The number of savings banks in Italy at the close of the year was twenty-eight; of these two are in the Sardinian States at Chambery and Turin; nine in Lombardy; eleven in Tuscany; one at Lucca; four in the papal towns, and one at Naples. The capital in the central bank at Florence amounted to three and a half million Tuscan livres, being about £112,500.

POLAND.

Within the last four years eighty-three works have been published in Cracow; of these two were historical, ten theological, and twenty-seven literary and poetical; and there are at the present time four book-printers, four booksellers, three print-sellers, and four libraries in that town. Joseph Muczkowski has been appointed librarian to the University, and is now engaged on a history of the University of Cracow. A new and complete history of Polish literature in three parts is also in course of publication from the pen of Professor M. Wisniewski, celebrated for his "*Denkwürdigkeiten zur Geschichte Polens*" and other works.

Garczynski has published some light, natural and vivid scenes of Polish early history (the 16th and 17th century) in his "*Powiesci Jadama*," a work in two volumes. Ambrozy Grabowski has also published a similar work, entitled "*Starożytnosci historyczne polskie*." A lady of high family and literary repute, Madam von R * *, a princess of G * *, has produced an entertaining work, "*Wspomnienia o Francyi*" (Recollections of France,) on the state of high society in Paris. Her remarks on Victor Hugo, and other eminent French authors, will be read with interest. The best and most comprehensive Polish and German dictionary is that by Professor Trojan-ski of Berlin, and the same remark applies to his Latin and Polish lexicon. An excellent collection of the early religious Polish songs and hymns has just appeared, entitled "*Spiewnik koscielny*;" the melodies have also been arranged with care and attention,

which renders the work additionally interesting. There are seven journals published at Cracow, viz. "*Gazeta Krakowska*," "*Zbieracz literacki*," the latter containing voyages, travels, tales, and anecdotes; "*Gazeta ogrodnicza*" (Gardener's Magazine); "*Pamiętnik farmaceutyczny*," (Medical Journal); the "*Rocznik*" (Annual Register); "*Rocznik towarzystwa naukowego*" (Annual Account of the Proceedings of the Society of Knowledge); and the "*Pamiętnik naukowy*," (Scientific Remembrancer). The two last mentioned are the most important, and contain interesting articles on antiquity and modern science, particularly on all information relating to the early Slavonic tribes.

RUSSIA.

The Monk Jakief, who recently returned from his religious mission to Peking, is now giving a course of lectures on the Chinese language to the pupils of the Oriental Institute, intended as missionaries to China. Baron Chaudoir, the Asiatic historian, is engaged on a numismatic work on the coins of China, Japan, and Cor, which will be published in Russian and French, and embellished with twenty-eight copper plates. M. von Hagemeister has published a work on the influence of the European trade with Turkey and Persia. The first part of a "*History of Siberia from 1535 to 1742*" has been published by Slowzow of Moscow. The study of the Armenian language has much increased in Russia recently, through the facility afforded by the publication of the "*Armenian and Russian Dictionary*" by Alexander Chodubaschew of Moscow, in two parts. A valuable addition has been made to the Asiatic library and museum of the Academy of Science at St. Petersburg, by the purchase of the oriental works and manuscripts belonging to the Baron von Canstadt, which the Emperor has purchased for 40,000 rubles. Some very interesting particulars respecting Odessa have appeared in the Russian almanack for 1839, recently published in that city; it also contains short notices of the Russian poets, Benediktow-Kukolnik, Podolinski, and Glinka.

The University of Dorpat was attended last year by 551 students; of this number only twelve were from other than Russian States. Of the various departments 223 belonged to the medical, 147 to the philosophical, 120 to the juridical, and 61 to the Theological faculties.

SPAIN.

The long-continued war, and the nearly balanced state of political parties in Spain, have not been without their lamentable effects on the literature as well as the prosperity of the country. Politics, personal abuse, and factious measures, even more than the war, have engrossed the attention of the press and the people to the almost entire exclusion of literary and other matters. The Spanish language has undergone a great change within the last few years, and

that which is now spoken in parliament is no more like the Spanish of Cervantes and Luis de Granada, than the German of Tieck and Jean Paul is like that of Gellert or Sponheim.

The principal Spanish writers are attached to the press. Thus the "*Revista de Madrid*," which is almost the only paper sent to other countries, is the organ of the Moderates, and contains articles by Galiano, Pedal, and Martinez de la Rosa. The "*Revista Militair*" is edited by Evaristo San Miguel, and is the organ of the liberals; in its columns are frequently some very spirited satires on the other two great parties. The "*Corresponziel*" is a statistical and official paper; and the "*Gaceta*" is rather more a literary than a political newspaper, but the "*Correo Nacional*," edited by Borrego, has more literary matter than any of the Madrid newspapers. The "*El Espagno*" is also an organ of the moderate party, and has the greatest number of subscribers and correspondents. The "*Correo*" is attached to the Bonaparte and republican interest. The provincial newspapers are of a very inferior character: the only ones worth mentioning are the "*Eco de Aragon*" and the journal "*El Tiempo*," published at Cadiz; the latter frequently contains philosophical articles from the pen of Lista.

Of the weekly and other minor periodicals there are—the "*Esperanza*," a weekly paper of one sheet, with a wretched lithograph, is only three shillings per annum. The "*La Mariposa*" (The Butterfly), is the organ of the fashions, presenting its readers with coloured plates monthly. The "*Panorama*" contains some good lithographs; the subscription is six shillings per annum. The provincial towns have each a few periodicals of this class. Saragossa has its "*Aurora*;" Granada its "*Alhambra*," and Malaga its "*Guadalhorze*," which has some lithographs of the best kind.

The annuals are about to be introduced, but they will hardly succeed, judging from the "*No me olvides*" (the Forget me Not), which was published in London a few years since, and edited by J. J. Mora; in fact, the Spanish ladies generally prefer a trinket or a splendid fan to books of poetry, even when embellished with plates and gilt edges.

There are several literary societies in Madrid. At the Athenæum, as well as at the Academy, lectures are given on philosophical and historical subjects, oriental languages, and foreign literature, but the number of subscribers has sunk so low that the society may be termed a failure; while the Lyceum, a society for dramatic representations, contains upwards of 800 members. The poet Zorrilla, assisted by learned coadjutors, has recently founded a literary academy, but as yet it has made but little progress.

The Dramatic is the only species of literature now cultivated in Spain, and this is carried to so great an excess that a vast deal of trash is intermixed. The best collections

are published in the "*Galeria dramatica*" and in the "*Repertorio dramatico*;" the former collection consists principally of old Spanish pieces. Of dramatic writers the most distinguished are Gorostiza and Martinez de la Rosa; the latter is now writing a new comedy for the Lyceum. To these must be added Antonio Gil de Zarate, and Manuel Breton de los Herreros.—The "*Troubadour*," by Garcia Gutierrez; the "*Loved one of Teruel*," by Don Ventura de la Vega; "*Donna Menzua*," by Harzembusch, also enjoy the highest favour. Among the second class of original dramatic writers, Joseph Garcia Villalta, Gregorio Romero of Larragnaga, Ramon Campoamor, Jose Maria Riaz, and Franz Diaz, must be considered as the highest in public estimation.

The most distinguished lyric poet of the present day in Spain is Zorrilla, who has written six volumes of poetry. The poetical works of Martinez de la Rosa, and the Duke of Rivas, are well known, as well as Pope's "*Rape of the Lock*," which has been translated into Spanish. The only original works of merit are "*Los armantes de Teruel*," by Teruel; the political romances of Tapia, the historical romance of Herman Perez of Pulgar; and "*Isabella Solis, Queen of Granada*," by Martinez de la Rosa.

The Spaniards, and even Cervantes himself, esteemed the "*Trabajos de Persiles y Sigismunda*" far more highly than "*Don Quixote*." The characters introduced are all well drawn—the men brave and honourable—the females virtuous and beautiful—the incidents of storms, shipwrecks, discovery of islands, &c., are all highly wrought. The second part is a journey through Spain, the south of France, northern Italy, and thence to Rome (in fulfilment of a vow), which is also described.

Respecting the Spanish dialects.—The people of the north speak the Bascuense, one of the most difficult as well as one of the most ancient of European languages, and dignified with written works which bear the stamp of an antiquity previous to our common era. On the east, the principality of Catalonia has another language, also ancient, full of energy, and enriched with a literature, which, though little known in Europe, and even in the Peninsula, is nevertheless considerable from the number of writers as well as from the diversity and merit of the works. The rest of Spain speak Castilian, the most modern, the most harmonious, the most cultivated, and the richest of the Peninsular languages. The lore of poetry, written in this language, is almost the only part known abroad of a literature as varied and rich as it is vast.

SWEDEN.

NECROLOGY.—Dr. Bengt F. Fries.—Among the many stars which have disappeared from the horizon of science during the year now drawing to a close, none shone with greater or more beneficial lustre than Professor De Fries, who filled the Upsal Chair

of Natural Philosophy; and was Chief Curator of the Museum of Natural History in the Swedish capital. Sweden has experienced no such loss since the fall of the great Linnæus.

The deceased philosopher was born in the province of Scone, in the South of Sweden, in 1799. Early an orphan, he was so fortunate as to enjoy the successive guardianship of two distinguished and literary men, the latter of whom—Count Gyllenröök—had a large private collection in natural history. But notwithstanding this, and the decided bent of his disposition to the natural sciences, he obeyed the wishes of his first guardian, and commenced the study and practice of the law. The subject, however, grew at last too repugnant, and he abandoned this department for more congenial studies. After many introductory tours through the provinces and islands of Southern and Western Sweden, and a long course of academical preparations, he became, in 1828, Lecturer in Natural History, &c. at the University of Upsala. But not content with his triumphs in this branch of science, he had also directed his unwearied energies to the study of medicine, and, after obtaining his doctor's degree, became regimental physician to the dragoon guards of Scone. The museums, both of Lund and of Stockholm, contain valuable testimonials to his zeal and talents in the medical faculties. The former possesses his very rich collection of "Preparations of the Brains of Animals,"—and to the latter he presented (besides a fine collection of insects, principally from Lappmark) a valuable "Series of Skeletons," the fruits of his labours in comparative anatomy.

Among many other methods employed by Fries for enriching the Museum which he valued as a child, we ought not to omit mentioning that he was the first in Sweden who established a vigorous and extensive system of exchanging with other museums in different parts of the world. In this manner contributions from abroad of rare and beautiful specimens added very considerably to the resources of the Museum.

In 1834-5, he commenced a Herculean labour—that of *de novo* revising, organizing, and cataloguing the whole contents of the National Museum. His rapid progress and eventual success were such as might have been expected from his unwearied labour, clear judgment and distinguished genius, and surpassed the most sanguine expectations.

But the principal monument which he erected to his country and himself was his great work on "The Fishes of Scandinavia;" exhibiting a clear and learned text and splendid fac-simile engravings, the result of immense labours and of long continued researches along the western coasts of Sweden, partly alone and partly in conjunction with the distinguished Swedish savans, Von Wright and Silfvestolpe. From his second coast-journey, especially, which lasted nearly a year, amid great hardships and ex-

posure on rocks in the ocean, he returned laden with spoil,—and when December came, his Christmas box to the Museum was ready,—a musæolum of the sea-tribes of the Archipelago of Bolmstän.

Herr Almgoist, a writer of great and diversified talents, has just commenced a work which promises to be of great interest, under the title "Menniskoslågtets Saga," the legendary history of the human race, united with geography.

Herr Bonnier, the enterprising bookseller and publisher of Stockholm, has brought out the first two parts of his "Picture-Bible." Each part contains two steel engravings. This work is immensely popular. He has also just completed the first volume of the collected Poems of the late distinguished and lamented bard Nicander.*

Lately has appeared the 12th tome of the valuable "De la Gardiska Arkivet." This volume contains a variety of documents illustrating the reigns of Charles the Tenth and Eleventh, besides various topographical and statistical papers. There is also a dissertation on the celebrated "Vision of Charles XI.," communicated by Count de la Gardie, in consequence of an article which appeared in the "Revue de Paris" for 1829. The whole affair is proved to have been an afterthought, and a court forgery.

Bladh's has lately published an excellent "Journey to Monte Video and Buenos Ayres."

Among the Christmas publications, we have two or three "Companions to the Almanac," two very pretty "Annuals," and a great number of books for youth, among which are Tales translated from Miss Edgeworth.

Some beautiful lithographs have just appeared—"Reminiscences from Turkey and Egypt," containing portraits of Mehemet Ali, the young Sultan, Costumes, &c.

Laing's Sweden has recently been translated into Swedish, and published at Stockholm.

MISCELLANEOUS.

The Poems of Schiller have always been one of the first objects to which the German student has turned his attention; but here he had been met with difficulties, obscurities, and mythological incidents which he applies in vain for his dictionary to elucidate. Mr. Edmund Bach is about to supply this omission by the publication of a complete key to all the poems of that celebrated author. His work, "The Poems of Schiller explained, with a Glossary elucidating the Difficulties of the Language, Construction and Allusion," now in the press, has been compiled with the greatest care and distinctness, and will prove without doubt an invaluable little present to the German student.

* There is a short notice of this poet in the deceased "Foreign Review," No. II. p. 635.

Dr. Lhotsky has a new work in the press on the interior of New Holland, being a "Journey from Sydney to the Australian Alps." The first portion of this work was originally published at Sydney, but the present edition will be considerably augmented and improved.

The want of a magazine which would supply this country with a knowledge of the literature of Southern Europe, and of Spain and Portugal in particular, is about to be supplied by the publication of a monthly journal, entitled "The Peninsular Magazine." This journal will be edited by Dr. H. de Lazeu, of whose ability to conduct the work there can be but one opinion.

One of the most entertaining works that has recently appeared is, "Michael Angelo considered as a Philosophic Poet," with thirty-five poems, most ably translated by John Edward Taylor, Esq. This work will really be found a little library treasure, both to the philosophic and the general reader.

A new monthly journal, entitled the "Colonial Magazine," and edited by Robert Montgomery Martin, Esq., is a valuable addition to the list of English periodicals; while the cause and the interest it advocates are fully sufficient to give it that large and wide circulation which the spirit and ability it is conducted with demands.

LIST OF THE PRINCIPAL NEW WORKS

PUBLISHED ON THE CONTINENT,

FROM JANUARY TO MARCH, 1840, INCLUSIVE.

THEOLOGY AND ECCLESIASTICAL LITERATURE.

- Albo, R. Joseph, ספר עקרים Grund- und Glaubenslehren der Mosaischen Religion. Nach den ältesten und correctesten Ausgaben und mit Anmerkungen begleitet von W. und L. Schlesinger. 8vo Franfort. Part II. 4s

FOR JULY, 1840.

ART. 1.—1. *Gotthold Ephraim Lessing's sämtliche Schriften*. Berlin. 1838–9–40.
2. *Fragmente des Wolfenbüttel Ungenannten*. Herausgegeben von Lessing. Berlin. 1835.

It is a natural and not uncommon pedantry of literary men to judge of illustrious personages merely or mainly by the character of their soul, or a part of their soul, as it appears upon paper. So Hallam in Martin Luther can find nothing but “bellowing in bad Latin;” and no doubt if precept or practice of “*Elegantia Latinæ*” were the most proper qualities to make a man be admired for ever in the galleries of the great, then Valla and Erasmus may justly be supposed far to outshine the monk of Wittenberg. But a man is great not by virtue of what he writes, or what is written of him, but by virtue of wise living words spoken in season, and hard blows hitting on the right place. It is also singularly strange, but very true, that a man’s greatness upon paper, or the figure he makes in any given department of literary activity, often bears no proportion whatever, nay often is in the inverse ratio of his greatness in word and in deed, and in the hard practical battle of truth against error and of good against evil. A man may electrify and regenerate a whole world and not write a word. Thoughts of the highest kind also have no ambition, no capacity to express themselves so that they may be counted by any literary lady, like *Pater noster* on a rosary. An irregular

fire-soul like Martin Luther’s flings forth truth, with reckless triumph, into the world; the hearts of men are fired; and amid the general joy and enthusiasm of emancipated thought, no one cares to ask whether the thing itself, or the neat model of the thing, in the shape of a book, shall or shall not delight the idle *εἰς τοὺς αἰῶνας* in the cabinets of the curious. What book-binding is to book-reading, that is book-making generally to living and acting; the mere outward dressing and exhibiting of a thing; a trade plied not unfrequently by men in whose neatly garnished brain-chambers all things seem to exist mainly for the sake of dress and exhibition; and not for dress and exhibition merely, but specially also that this or the other man-milliner may make himself a mighty hunter in the world of books, by dressing up this or the other remarkable history in elegant prose, or more elegant verse—the mere vanity and foppery of the artificial or at best secondary manhood of the pen. Despite of all which, however, we find that the great majority of mankind continue to judge of things by their living and substantial worth only; and the *Veni, vidi, vici* of true genius is admired of all ages, not because it was written, but because it was done.

Gotthold Ephraim Lessing was in no sense a child of gigantic impulse, a soul of potent thunder and lightning, like Martin Luther. He could not “bellow” like the great reformer, though he could cut as keenly, and more neatly and scientifically. Nevertheless there is something irregular, and

to the superficial observer paradoxical, in his whole appearance; something that will not fall easily under any of the common critical categories; something that looks very unfinished and unsatisfactory upon paper; lines innumerable; sketches finely conceived and powerfully drawn, but fragmentary, or zig-zag, working themselves now out of, now into, strange corners, and ending, to all practical purposes, so far as we can see—in nothing. The truth is that Lessing was more concerned to work on his own age than for posterity; at least circumstances so brought it about that he was continually engaged in critical, theological, artistical battles, the fighting of which was not the less beneficial to his age and country, that the modern English critic can with difficulty interest himself in them, and, from feeling perfectly indifferent to the issue, somewhat hastily concludes that the man who laid so many pigmies low was himself a pigmy—at least a champion much overrated.* The interest of battles literary and political ceases with the day; but the fruit of battles well-devised, and well-fought, is eternal. Consubstantiation is forgotten, but the German Reformation remains; the Silesian war may force little sympathy now, but the Prussian kingdom can command respect: so Klotz, and Goetz, and Gottsched; shallow learning, sectarian bigotry, Frenchified pedantry, are things no longer named in Germany; but a German literature exists among the most erudite, the most humanized, and the most characteristic that are, of which literature Lessing was one of the noblest pioneers; and a German language is studied by all European thinkers, of which language Lessing was second—we will not say to Goethe—the most masterly handler

Lessing has produced pieces finished and

* "Lessing is one of those who have been overpraised; he was esteemed a great poet: but we cannot now concede to him the inspiration of poetical genius. He was endowed with numerous and very different capacities; but his studies were desultory, and he had much more zeal than perseverance. He was not less paradoxical, and, to use a word which was not born when he lived, but to which he answered exactly, revolutionary. His exertions and acquisitions were immense. He had a perpetual thirst for new discoveries, and for discovering new views of old ones; but his plan of proceeding was fitful and irregular. His whole way of life corresponded to the bias of his mental character; he was in every sense of the word eccentric."

... "He could commence no poem without laying down a theory for his own guidance; he was always calling himself to account, and mistrusting his impulses, a habit which affords us sufficient evidence of his want of the innate confidence which characterizes a great mind." Germany, by Bisset Hawkins, p. 91. The whole criticism appears

perfect in matter and form, which may not indeed, as Menzel thinks, "be sufficient to place him side by side with the greatest poets of all nations," but which must ever remain classical, so long as good taste, a clear understanding, and high-toned manly feeling, shall prevail over the literature of fermentation and excitement. But it is wiser and safer to base Lessing's reputation upon what he was and did to his own age as a great literary reformer, than upon what he is to us now, or will be to a distant posterity. Not that there is anything false or ephemeral about him; he is as true and real, as healthy and enduring, in what he has done as anything can be; but what he has done for us of the 19th century in England bears a very small proportion, in public and popular importance, to what he did for his own Germans of the 18th century. And not only what he *did*, but, as we already said, what he *was*. "Many wits have sparkled more brightly," says Goethe, "but where will you find such a CHARACTER?"* Lessing was in his works, and in his writings, the very beau-ideal of manliness; and this is the very thing which of all others, to the Germans of the last century, was the most necessary to be exhibited. Not only flat and barren as the sands of Brandenburg was the German literature of the year 1750, but there was something worse than that—effeminacy, puerility, childishness. Indeed the whole age was corrupt. In every petty principedom luxuriated a government of priests and Pompadours, French cooks and English dogs; and nothing of a stern sort to set against this glittering corruption but the icy sarcasm of Frederick, the stilted pedantry of university learning, and the stiff, stubborn rigidity of old Lutheran orthodoxy. How deeply disease was seated in that age, a healthy English eye reads without much difficulty in the works even of the greatest intellects that afterwards covered Europe with their fame. The fine fuming Platonism of Wieland's early works was disease. Against that the voluptuousness of his afterwards was a reaction, and, like other reactions, went a little too far. Schiller's Robbers, Goethe's Werther, Klopstock's bardism, were equally diseases; all full of dissatisfaction with the present, lingering languidly over the past, or grasping madly at the future. Jean Paul's sentiment is not always altogether without sentimentality; and the post-Wertherian Goethe (a new man certainly in all respects) found shelter in the hot-house of court favour too early to grow up

* In Eckermann's Gespräche. See F. Q. R. No. XXXV.

a perfectly stout and sturdy plant. In such a state of things Germany wanted nothing so much as one healthy, vigorous man; a man who, though he might be neither a Titan in poetic genius, nor an emperor in the world of books, was still in all necessary points a perfect MAN; with a clear eye to see things as they are, a healthy heart to enjoy them, a strong arm to smite down folly in high places, a mouth to speak unceremonious truth, and the keen edge of wit to lancet the rottenness of the times. Such a man was Lessing.

The outward fates of Lessing were something more varied than those of many contemporary literary characters in monotonous Germany, but still he was the literary man. His life was rambling enough indeed, so far as mere locality is concerned; but, excepting a short military interlude during the seven years' war, he never was allowed to shake himself free from the pleasant slavery of the pen. He lived by his wit. He was proud too, and had some very nervous ideas about literary independence. He would not accept a professorship in Königsberg because the reading of an annual panegyric was a part of the office. He admired the kingship of the great Frederick, but he shunned his service; well knowing that where that commanding eye watched it must be master, making every other, even Promethean intellect, blend—

“ἐλευθερος γαρ ουτις εστι πλην Διου”—

as may well be said of the Prussian monarchy. To live on a Cardinal as Winckelmann seemed to live, or on a Grand Duke as Goethe was a thing to his literary pride of all things the most distasteful. But he made no parade of this independence. He merely did not seek after pensions and worldly advancement, being gifted by nature with the true poetical instinct of contentment. He could dine in Berlin for one groschen and six pfennings, and say a grace with the true thankfulness of a man heartily hungry. He lusted after no aristocratic flesh-pots, expected no patronage from “gentlemen of the Caledonian hunt” (like poor Burns), and was not disappointed when he did not receive it. He knew that a literary man's portion is not in this world; money not the coin in which he can either pay or be paid; rank not the god for whose favour he can hope, or whose frown he can fear. He had only one maxim of conduct from the beginning to the end of life—“*Wer Gesund ist, und arbeiten will hat in der Welt nichtz zu fürchten!*”—Work what

you can work like an honest man and trust in God. There is indeed no other maxim upon which a MAN can be made; and of all mortal men the literary man, who wishes to eschew the humiliation of the pauper and the shame of the thief, (and there are thieves and paupers of a very respectable kind in the literary world,) must most anxiously act upon this maxim. We may say indeed with truth that the literary man, who cannot afford with a jovial stoicism to starve, is utterly unworthy of his vocation, and has not his heart in the right place. In Lessing we never see a hint that the “*res angusta domi*,” which he knew too well, had ever cramped his ideas, or straitened his sympathies.

Lessing was born at Kamentz, in Upper Lusatia, in the year 1729. He is thus contemporary with Klopstock, who was born in 1724; twenty years the senior of Goethe, and thirty years the senior of Schiller. His father was for many years a Lutheran pastor in Kamentz; a man of considerable theological learning, honest, though somewhat stern, and of strict Lutheran principles, and thoroughly imbued with the true German reverence of books and universities. Learning, indeed, seems to have been hereditary in the family; the grandfather wrote a dissertation, “*De Religionum Tolerantiâ*,”—a sort of prophecy of Nathan the Wise, so early as 1670; and the father had no fonder desire than that the son should turn out, what he did, (though in a very different fashion from what the severe old Lutheran had anticipated,) the most learned man of his age. Lessing's education, like Goethe's, carries on the front of it painful marks of the pedantry which unfortunately characterized then, and still, to no small extent, affects the schools of Europe. It was then conceived that mere Latin and the Church Catechism, both drilled into the juvenile soul, as soldier-ship is into the “*élèves*” of a Russian military academy, could make “a proper man.” Defective as this system of education was, Lessing made the best of it; in the free school of Meissen, for five years, he worked hard and read much—(“a horse that requires double fodder,” Rector Grabner said)—and thus laid the foundation for that solid scholarship upon which an English gentleman plants his ladder of political or clerical advancement, and with which a German thinker furnishes his Pantheon of multifarious speculation. In the school at Meissen, Lessing studied principally Plautus and Terence; thus evincing an early and decided preference for that dramatic form of expressing his ideas which he so frequently used in after-life. To the University of Leipzig, where the celebrated

* Brief an seinen Vater. Leben von seinem Bruder. Berlin. 1793. Vol. i. p. 252. j

Ernesti then expounded the "literæ humaniores," he was sent—unfortunately without any definite aim. His father destined him for a professor in some university; to which dignity he would doubtless have risen in due season, had there not been a theatre and a Madame Neuberrin in Leipzig, who, for a young man, and an ardent student of Terence, could not be supposed to be destitute of attractions. Moreover, the young Lessing began to perceive, at a very early age, that the Latin and Lutheranism into which he had so anxiously been drilled, had gone far to make him a pedant. Instead of law, medicine, and theology, dancing, fencing, and riding were his principal studies for the first semester in Leipzig; and instead of his curriculum ending with a learned philosophical or philological thesis, he wrote a comic piece (*Der junge Gelehrte*) for Madame Neuberinn's stage; in which a young man of gigantic learning was made (as scholars generally are on the stage) the dupe of a clever chamber-maid, a plump knave of a valet, and his own egregious vanity. What is worse, the young student was observed to choose his associates with more regard to good fellowship than to that outward decency which Leipzig respectability so highly prized. His bosom-friend was one Mylius—a name even now not quite forgotten in German literature—a loose-dressed, slovenly, ill-shod, careless genius, and suspected, not without reason, of being a free-thinker. All this came to the ears of the pious father and the more pious mother, and the consequences may be imagined. Frequent letters from the father, full of reproaches and railings; indignant answers from the son, very plausible to a young poet, but to an old Lutheran divine very unsatisfactory. The theatre—as in Scotland at a much later period—was judged to be the gate of hell. To Lessing, with Æschylean religion and Euripidean morals in his head, it was a sort of pulpit. Fire and water could not agree, and a general break-up ensued. Lessing fled to Berlin—whither his free-thinking friend had started before him. Berlin was the metropolis of illumination in those days. In what more fatal place, under the very upas-shade of infidelity, could a pious Lutheran father see with anxiety a dear-loved son? But so it must be. With sharp reproof from a stern father, with pious tears from a fond mother, with solemn warnings from a religious sister, (she burnt his Anacreontic odes, thinking that the praise of wine was drunkenness,) with many strange speculations in his head, and without a penny in his pocket—to begin a literary life in the year 1750, in Germany, was somewhat ominous. But to a well-knit

muscular fellow like Lessing, with high animal spirits and a clear blood, a capacity to dine heartily on one groschen and six pfennings, and a disposition to praise God for every dry crust, all this was nothing. We accordingly see the friendless scholar and breadless literary adventurer rising by degrees, through much tribulation of erudite fag-work and æsthetical patching, into a man of note and likelihood.

At Berlin Lessing had a small adventure with Voltaire; it was the year 1750. The French philosopher had just come to Berlin from Potsdam, where he had finished his "*Siècle de Louis XIV.*" His then secretary, Richier de Louvain, was a friend of Lessing. From him Lessing got hold of the first proof sheets of the *opus magnum*, by special favour; for there was to be a private publication at *Sans Souci*, for the benefit of Frederick, before the profane world at large should gloat upon the wisdom of the philosopher. By special favour again from Lessing, another friend got hold of the precious proof sheets, and he placed them most unfortunately in the hands of the Gräfinn de Bentinck, Voltaire's particular friend. The Gräfinn fired. She had been refused a sight of the work expressly on the ground of the royal right of pre-perusal. She flew to the philosopher and rated him soundly. The philosopher was confounded. He called his secretary and rated *him* soundly. He then wrote a furious letter to Lessing, accusing him of having furtively abstracted the precious work, or, at least, of unjustly retaining possession of it, with the design of making money (as a poor *littérateur* might) by a hasty translation. The letter was signed magniloquently—*Chambellan du Roi!* Lessing wrote Richier an indignant reply in French, purposely that Voltaire also might read it; for the Frenchman was not then found who would condescend to learn German:—

"Sachez, mon ami, qu'en fait des occupations littéraires, je n'aime pas à me rencontrer avec qui que ce soit. Au reste j'ai la folle envie de bien traduire, et pour bien traduire M. de Voltaire je sais, qu'il me faudroit donner au diable. . . . C'est un bon mot que je viens de dire; trouvez le admirable je vous prie; il n'est pas de moi."

We have mentioned this anecdote, unimportant as it may appear, because it is the only anecdote we have of Lessing's personal collision with a man, against whose literary dictatorship it was a principal object of his life to contend. From the year 1750 to 1780 to make a business of writing down Voltaire in Germany was no small merit. It indicated peculiar clearness of vision, great moral health, and a very uncommon independence of mind. It showed also manifestly

that Lessing was what the Germans of that day had not learned to be, a thorough German, and a man who gloried in asserting his German character. His estimate of the Frenchman's writings was, perhaps, too cheap; witness the following critique, in the shape of an epitaph:—

"Here lies—w re churchman's wish the will of God,
Who long ago had lain beneath the sod.
May God forgive the *Henriade*,
His tragedies and verses!—all are bad;
His other works, the truth to tell,
Are pretty, pretty, very well."

To write so under the nose of Frederick the Great was ominous of Schlegel and Schiller, and Kant, and Arndt, and Follen, and Menzel; of that truly national and anti-Gallican character by which German literature, and especially German criticism, has, since its late regeneration, been so honourably distinguished.

In the year 1754 Lessing became acquainted with Mendelsohn and Nicolai, and formed with them a connection which lasted through life, as advantageous to German literature generally as conducive to the private improvement of the three friends. It is a trio that will be remembered. What rare debates and disputations they had, frolicsome and yet serious—

"Winging their progress, pondered well,
From Heaven to Earth, from Earth to Hell—"

as Germans will debate!—Lessing, with the mass of a claymore and the quickness of a small sword; Nicolai dealing out a philosophy of somewhat flat and prosaic Protestantism, broadly as a haberdasher measures cloth, but with honest measure; and "our dear Moses, who is to us what the chorus was to the ancient tragedy—a wise listener of our learned discussions, ending and epitomizing them quietly with a word."* Nicolai, indeed, has been somewhat unfortunate in the immortality which he has received in the famous Brocken-Scene in *Faust*. He is held up to ridicule as the beau-ideal of a narrow, barren, carping, pedantic criticaster.

"Witch. What wants he here, that rude-like fellow there!

Faust. Oh, he is every where!

What others dance, 'tis his to prize;
Each step he cannot criticise

Had as well not been made. But in the dance

It grieves him most when we advance.

If we would wheel us round and round in a ring,

As he is wont to do in his old mill,
He would not take it half so ill!

Especially if you take care to bring
The rightful offering to his master skill."

* Nicolai, Schreiben an Lichtenberg. Lessing's Antheil an den Litteratur-Briefen.

This is severe enough, but poet Goethe had received a personal injury from the Berlin bookseller in the shape of "The Joys of Werther," a satirical reply to his sentimental "Sorrows;" and Lessing himself, the edge of whose lancet was as keen as Nicolai's might be blunt, had not hesitated to probe to the bone the diseased moral constitution out of which this much-bespoken German Eloise had grown. But the truth is, that the Berlin school of criticism, of which the *Bibliothek der schönen Wissenschaften*, (1757), the *Litteratur-Briefe* (1759), and the *Allgemeine Deutsche Bibliothek* (1765), were the successive organs, whatever defects they might have at a period when periodical literature all over Europe was in its infancy, were decidedly opposed to romanticism, transcendentalism, mysticism, sentimentalism,* (Germanism, according to our comprehensive phrase, under all modifications),—in some measure, no doubt, from shallowness, but in part also, as we must say, in charity, from clearness of vision, and an honest desire to know what a man is doing. Nicolai, Mendelsohn, and Abbt might be only third-rate men: of the three, Nicolai was certainly somewhat *breit*; but they performed the necessary work of criticism creditably; and where the spirit of Lessing presided, there was no quarter to effeminacy, or beautified corruption in any shape.†

Next to his permanent connection at Berlin with Nicolai and Mendelsohn, the two most notable events in Lessing's life were his campaign in Silesia, in the capacity of secretary to General Tauenzien, during the three last years of the seven years' war, from 1760 to 1763, and his appointment to the celebrated post once held by Leibnitz, as librarian at *Wolfenbüttel*. For a dramatic poet, or indeed for a writer of any likelihood, he had lived too much among books, and too little in the bustle of active life; a mischance to which German writers generally, from the want of a stirring public life, are particularly liable. To throw off the dust of the "*Studirstube*," which was too manifest in Sarah Sampson and his earlier plays, seems to have been, after mere amusement and variety, Lessing's main object in

* Letter to Eschenburg, 1779. Menzel's *Deutsche Litteratur*, iii. 291—3. Menzel's own remarks on modern sentimentality in this place are admirable.

† We have used the phrase "the spirit of Lessing presided," purposely to express the real state of his connection with Nicolai. In point of fact he never contributed an article to the *Allgemeine Bibliothek*, and only one to the *Bibliothek der schönen Wissenschaften*. But he wrote a great part of the *Litteratur-Briefe*, and was practically looked on as the Coryphæus of the Prussian school.

joining the Silesian camp. Accordingly, it was to no purpose that his literary friends in Berlin made wondrous speculations on his eccentricity. Mendelssohn might write—

“Wenn er nicht hört, noch fühlt, noch spricht,
Noch sieht; was thut er denn?—*Er Spielt.*”*

Lessing was determined to know the world; and that he both heard, and felt, and spoke, and saw, notwithstanding Moses' simple couplet, *Minna von Barnhelm*, the first classical, truly national comedy of the German stage, sufficiently proves. As to the gambling, which is the only *point* in the reproach, Lessing frequented the card-table at Breslau for the same reason that Englishmen smoke in Germany, and stiff people dance at Almack's—because it was the only passport to society in the place.

The Wolfenbüttel librarianship was a more important affair, and proved permanent. Even in Breslau, amid the bustle of war, and the dissipation of a military life, like a true German, Lessing had never ceased to collect the most learned and the most curious books. Pity, it may be said, that the mouth of the living should be choked amid the dust of the dead! Schlegel has lamented that the Wolfenbüttel appointment should have led such a large soul to grope and dig fruitlessly in the narrow dark corners of antiquarian research; but Lessing did not dig *fruitlessly*, and we are not entitled to say, that his activity in this department was less profitable to German literature, than it might have been under more public and popular auspices. The learned men of Germany had long been so heavy and lumbering—so much even on the most trivial subjects in the style of “*Universal Dictionaries*”—that they required to be stirred up by an active nimble spirit, who could move cleverly, with an easy turn of his natural wrist, what to them required levers and pulleys, and fortifications of quartos and folios, to the common man impregnable. Lessing's restless intellect, travelling in glory through much dust and rubbish, shot unexpected light into regions which, but for him, had remained dull; theology, philology, philosophy, all were quickened by his touch. He had only time to touch, but his touch was regenerative; and academic pedantry yawned hugely, and gave up the ghost before him.

From the Wolfenbüttel library Lessing not only brought a number of the most curious ancient tracts to light, but he also embraced this opportunity to give to the world the Wolfenbüttel Fragments, in which

proceeding he was greatly blamed by many even of his personal friends. These papers the original author, Reimarus, in *Hamburg*,* had either not dared to publish in his own name, or was not inclined to publish at all. Lessing's own religious opinions were precisely in that state of nicely balanced poise which would naturally prevent him from either attacking or defending Christianity in his own person. He was willing, however, for inquiry; nay, inquiry and discussion had, to him, become a necessity; and by publishing Reimar's *Essays*, he set forth the difficulties with which he was embarrassed, not as dogmas, but as doubts. Natural as all this undoubtedly was, it was no less natural that the publication of avowedly deistical fragments, in days when neology had only seen its germ, by a writer of such talent and influence as Lessing, should excite considerable sensation in Germany, and no small outcry among theologians. Lessing, no doubt, had sense enough to see this; and we are accordingly unwilling to attribute his death, which happened shortly after the publication of the Fragments, to any mortification arising out of his controversy with pastor Goetz.† If his early death had any psychological cause, we may attribute it to the solitary state in which he was left by the loss of a dearly-beloved wife, and the want of bustle and varied society in the vicinity of Brunswick and Wolfenbüttel. Besides, he stood now almost entirely isolated in the literary world. The orthodox Lutherans denounced him; the ready made rationalists and illuminatists did not comprehend him; Goethe and Wieland were too effeminate and voluptuous for his stern and manly taste; in Klopstock's dignity there was something formal and repul-

* *Conversations Lexicon, in voce.* From the head *Fragmente* in the same work we extract the following:—

“Who the author of the Wolfenbüttel Fragments is has not been proved to absolute certainty, but it has been very generally attributed to Reimarus, the author of the able discourse on *Natural Religion*. It has been rightly judged that the author of the Fragments distorts much in a dishonest manner (*verdreht vieles unredlich*), has misunderstood much from a deficient knowledge of antiquity, and has, on the whole, framed a very illiberal judgment of Christianity. The most famous among those who replied to him are Doederlein, Semler, and Michaelis. The work of Doederlein, ‘*Fragmente und Anti-Fragmente*,’ is written with so much calm judgment, learning, and taste, that it has been rightly looked upon as the most successful answer that the author of the Fragments has yet received.”

† We make this remark in consequence of what Nicolai says, “*Die theologischen Streitigkeiten verbitterten die letzten Jahre seines Lebens, und trugen zu der Beschleunigung seines Todes viel bei.*”—*Briefe*, No. 47.

sive; in all Germany he could find no fellow-worker in his own style—a strong Doric architecture of poetry and philosophy wedded. He died on the evening of the 15th February, 1781, aged fifty-two years.

We now proceed to ask what are the tangible results of Lessing's literary activity; and here we stumble on the main difficulty of the case to the mere English student. English literature is the literature of character and action; German literature is the literature of thought and feeling. It is extremely difficult to make an Englishman, who is not heart and hand a German student, estimate the writings of Lessing as they ought to be estimated. Earnest and serious thought—a hungering and thirsting after speculative truth—a love of scientific investigation for its own sake—not profound piety merely, but an innate instinct to probe the philosophy of all religions—are qualities of mind necessary to the proper appreciation of most German writers, much more of a fragmentary and polemical writer like Lessing. But John Bull, as we all know, is more of a churchman than a theologian—deals more in common sense than in philosophy—and while he pleases himself with describing men, leaves to the German the less grateful though not less necessary task to speculate about man. Nevertheless we shall endeavour to state the more manifest results of his activity, so as to satisfy the general English reader, with as little German mystification as possible.

Happily, in the first and most obvious phasis of his activity, Lessing stands forth from amid the cloudy envelopment of German speculation, as intelligible, tangible, and we may say, thoroughly English a mind, as the English student might desire. We find him, as a dramatist, free from all that mock heroic extravagance, or dreamy, floating, uncharacteristic poetry, that in many German dramas so reasonably offends our manly English taste. Lessing was the poet of reality, and of living, acting nature, so far as he knew it, or could know it in a *German* world. Of the three German minds of the last century, Goethe, Lessing, and Kant, the least artificial, and, so far as manner is concerned, the most thoroughly English, was Lessing; for Kant dressed up his practical philosophy in a scholastic phraseology, which created more appearance of mystery than really existed; and Goethe's much bespoken objectivity was of too delicate, voluptuous, and artistical a nature to meet with any ready sympathy from the rude, rough, brawny Briton. Lessing was altogether free from every sort of philosophical or æsthetical mannerism. What it was given

him to see, he saw plainly; and he said plainly what he saw. Hence the perfection of his dramas *within their own limits*, both as to matter and style. They are perfectly true, exact, and natural; and perfectly free from any sort of cant and humbug. Nothing false is admitted, however fine; nothing that when analyzed is mere phrase, however brilliant. He speaks directly *at* the thing, neither painting out nor building up—the real secret of the dramatic style. To the Germans such a man *was, is* invaluable. We, with our Shakspeare, and a host of not unworthy satellites, may afford to look down upon him coolly enough; and yet, beyond Shakspeare, even we—born dramatists as we are—will find it difficult to produce many plays, that in perfect dramatic finish are more classical than Lessing's three ripe pieces—*Emilia Galotti*, *Minna von Barnhelm*, and *Nathan the Wise*. True, we may think them cold and even bare, when set against our master-pieces; but what is there that we English will not think cold after the fire and fury that we delight in on the stage? And what will we not consider bare, after that super-ornate style of poetry, which we seem to have made a law of, to compensate the habitual baldness of our prose? This, however, the admirer of Lessing must allow, that his genius was too pointed and exact, not sufficiently rich, luxuriant, and vehement, for high dramatic excellence. That he is not entitled to rank as a dramatic poet of a high order, the very smallness of the number of his classical plays sufficiently indicates. Fertility is not always great; but great geniuses are always fertile. Lessing himself seems very modestly to have been of opinion that he had no dramatic *genius* at all. The passage in which this self-condemnation occurs, is curious.

"I am neither a player nor a poet. I am complimented indeed, not seldom, with the latter honourable title. But they do not know me. A few dramatic essays that I have ventured do not justify this forward generosity with the title of poet. Not every man who takes a pencil in his hand, and mixes colours, is a painter. The oldest of these essays of mine belong to a period of life when readiness and dexterity are often mistaken for genius. In those of a later date, if there be any thing tolerable, I am conscious that I owe it all to criticism. I do not feel in myself that living fountain which by its own strength lifts itself up, by its own strength sports and spreads in radiations so rich, so fresh, and so pure. With me it is all squeezing and pumping (*Ich muss alles durch Druckwerk und Röhren aus mir heraus pressen*). I would be altogether poor, cold, and short-sighted, did I not here and there know how to borrow modestly from foreign treasures, to warm myself at another man's fire, and to strengthen my sight with the optic glasses of art. I am, therefore, always

ashamed and angry when I hear any person cry down criticism. Criticism, say our very clever young masters, checks genius: whereas I flatter myself, by help of this severe lady, to have done something that comes very near genius. I am a lame man whom a philippic against crutches cannot particularly edify."—*Hamburgische Dramaturgie*, the concluding number.

This is showing one's weak side to the public (it was a *public* confession) in a style that, had a greater dramatist said it, might have fallen conveniently under the category of "fishing for a compliment." As it is, we must say that there is a great deal of meaning in it; that the word genius, however, is a very doubtful and dangerous word, and has been justly suspected by all sensible men in this country, from Reynolds to Walter Scott; and that taking Lessing on his own confession, it merely proves that his dramatic talent, however finished the works it might produce, was neither very ready, nor very exuberant. To us it is plain that Lessing's genius was decidedly dramatic. No one will read his first juvenile piece, "*Der Junge Gelehrte*," a mere farce, without perceiving a fine eye for dramatic situation. Lessing's modest rating of his own talent, indeed, seems to have been of the utmost benefit to him, in forming his dramatic style. He was a close and intelligent student of stage effect. Neither Aristotle, in whom he was deeply read, nor natural genius, which he disclaimed, could teach him this. Wise was the man who could always believe that he had much need to be taught!

In order to do justice to Lessing as a dramatist, we must consider in what a state the German stage was before he appeared—an estate truly deplorable. On this subject himself will be the best spokesman.

"The best that we Germans have as yet produced are a few *Essays* of young men. Nay, our pedantry is so great that we consider young men as the only proper fabricators of theatrical warces. Men have more serious and worthy employment in the state and in the church. What men write should besem the gravity of men; a compendium of law or philosophy, an erudite chronicle of this or that imperial city, an edifying sermon, and such like.

"This solemn pedantry being, and having long been, so fashionable amongst us, let us not be surprised that our elegant literature stands so far behind—I will not say the literature of the ancients but the literature of all modern cultivated people; say what we will, it has a *puerile* and *childish* cast, in the middle of this eighteenth century, and will, I fear, long retain it. Blood and life, colour and fire, we have in some measure at last; but pith and nerve, marrow and bone, are sadly deficient."—*Dramaturgie*, 1st April, 1768.

And again, he refers to the subject in the passage on Gottsched and his famous pedantry, which we regret we cannot extract.

Truly of young aspiring talent in these times it might be said, as of the miser's horses,—

"Fed on this pasture, in this stable born,
What vast ideas they must have of corn!"

The work from which the extract above is taken—the *Hamburg Dramaturgy*, contains a series of criticisms on plays acted at Hamburg in the years 1767-8. Lessing spent a year here as theatrical critic before he came to Wolfenbüttel. In this work it was that Lessing opened that battery against Voltaire which was to pave the way for the canonization of Shakspeare in Germany, put an end to the unseemly coquetry with France, and unite England and Germany as closely in literary, as they are in physical kinship. Twenty years before Goethe, Lessing held up Shakspeare to his countrymen as the great dramatic model; forty years before Schlegel, he studied Calderon. Before Schlegel also, he studied and appreciated the Greek drama, placing himself—where alone it could be studied and appreciated—on Greek ground.

The editors of "*The Greek Theatre*" might adopt the following passage for a motto.

"What convinced me that my notions of the drama were right is, that by my own independent reflections, I arrived at the same conclusions as those which Aristotle has so happily abstracted from the many master-pieces of the Greek stage. I have no hesitation in saying (however certain people may laugh) that I look upon Aristotle's work as the infallible Euclid of the stage. Of tragedy in particular, I am ready to prove beyond contradiction, that it cannot move one step from the line of Aristotle without moving from its own perfection."

Lessing's plays are not only valuable as perfect models of German style, but as living and characteristic pictures of the age in which he lived. Emilia Galotti is a stern record of the worthlessness and corruption of petty German principedoms in an age where portentous Dubarrydom (as Carlyle phrases it) reigned over the half of Europe. Minna von Barnhelm is a fine cabinet picture of honest honourable German soldier-ship during the famous seven years' war. The honesty belongs to Germany; the honour (so Menzel says) peculiarly also, as no one can doubt, to Lessing himself.

Nathan the Wise is that one of Lessing's dramatic trio which (looking not merely to the form but to the inner soul of it) is at once the least adapted to English taste, and the most characteristic of Lessing's genius; the perfect symbol—the bloom and ripe fruit of his whole poetical existence, we may say;

but altogether unfit for the present, though haply not for some future and more intellectual stage.

Southey, in *Thalaba* and *Kehama*, has endeavoured to show, and we think shown successfully, how something as analogous to the spirit of Christian faith, as Platonism, for example, may live and flourish in the soul of a Mahometan or a Hindoo; Lessing also, in the character of Nathan, a Jew, has done his difficult task better than most writers, for Cumberland's Jew is an utter failure, and so are all attempts to endue this race with Christian virtue, whether conversive or imaginative.

As to mere style, which in Lessing's works has been often and deservedly praised, no man possessed more largely than he the natural instinct of shaking himself free from all vain entanglements and useless adornments of words. Simplicity almost to barrenness; precision and point almost to the fault of habitual epigram, characterize every page. This appears particularly in his fables, which he composed upon a model exactly the reverse of *La Fontaine*. With a native Saxon impulse, he placed himself instinctively counter to everything French. In this, Coleridge did not surpass him. He knew also well, how completely the solidity and simplicity that becomes a German are identical with what we are accustomed to admire most in the classic works of Greek antiquity.

But Lessing, we think, erred in the opposite direction to *La Fontaine*, and gave us fables (in plain prose after the Old *Æsopian* fashion), which, in aiming at condensation and precision, lose that honest breadth of simple narrative, which, within its own narrow limits, characterizes the ancient fable. We may give a few examples.

THE APE AND THE FOX.

"Show me an animal so expert whom I shall not be able to imitate!" boasted the Ape to the Fox. But the Fox replied, 'And show you me an animal, how mean soever, whom the conceit could possess to imitate you!'

"Writers of my country! do you wish that I shall explain myself further?"

THE SPARROWS.

"An old church, where the Sparrows had their nests, was repaired. When it stood in its new splendour, the Sparrows came back again seeking their old habitations; but they found them all built up. 'What is the use of this building,' cried one; 'it is not worthy that we dwell in it,' cried another. And away they flew."

THE FOX AND THE STORK.

"Now tell me, I pray thee," quoth the Fox to the Stork, 'what wonderful adventures thou hast seen in those far countries thou hast been travelling.'

"And the Stork forthwith began to name every pool and every fat meadow where he had found the most delicious worms, and the plumpest frogs."

"My friend L. wrote a book of his tour in the North somewhat after this fashion."

THE BOWMAN.

"A certain man had an excellent bow of ebony with which he shot far and surely, and which he prized highly. On one occasion, however, looking at it attentively, he said, 'You are certainly a little too rude, too bald in your simplicity, but that may be mended.' So he went immediately to a famous carver, and caused the whole story of *Atalanta* and *Meleager* to be carved upon the bow. Who can deny that this was a very proper history to be carved upon a bow."

"When the work was done, the joy of the man was great. 'Well thou deservest such adornment!' he said; and being willing to make fresh trial of its strength, he drew the string, and the bow broke."

Lessing wrote epigrams also—happily not many. It is an idle work, a sort of shooting cleverly at nothing; for an epigram writer has no object, unless indeed he hits a person; and this, a wise man will rather let alone. The following are characteristic.

ON A PORTRAIT OF FREDERICK THE GREAT.

"Spare me the name!

That lofty mien unlabelled doth proclaim
The thinker. Aye! a *thinker* only knew
To be philosopher and hero too."

ON KLOPSTOCK.

"Klopstock is great, sublime, the German Milton,
All praise the bard, but will they read him?—No.
Us common men who walk without a stilt on,
If you will read, we'll let your praises go."

EPIGRAM ON THE EPIGRAM.

"Pointing again!—and whence this Martial's mood
Would'st thou be told?
From this and other things I must conclude
I'm getting old."

Such things may be dropped occasionally by accident as it were; if a man does not make a business of it, like old Logau. However, the Germans have a natural talent for stringing isolated pearls together, as the Orientals call it. Schiller composed some pretty things of this kind, which even Coleridge was not ashamed to steal.

Among the tangible results of Lessing's many-sided activity, we must not forget to mention, and we need only mention, the *Laocoon*. This admirable discourse on the limits of poetry and painting may be read even now with pleasure and profit by every lover of the arts. In the year 1766, in Germany, it was like all Lessing's works—a prophecy of better times; an anticipation of the present flourishing state of the science of antiquity in Germany; of that living archaeology of sympathy and reproduction which the names of Boekh and Müller have so exalted. It is to be lamented that in this country Greek written literature has hitherto

been studied in a spirit of exclusiveness, sadly to the neglect of the Elgin and the Ægina marbles; whereas it is manifest that Greek art is to us the most valuable bequeathment of Greek genius; the Christian pulpit superseding the theology and moral philosophy of their stage, and the ancient drama in all other qualities of dramatic excellence being confessedly eclipsed by the modern; yet in oratory and design they remain unrivalled; and these sciences should be taught generally in all our schools, and expounded publicly in all our universities. Then would Lessing and Winckelmann, Goethe and Müller, of the plastic school, be names of more significance to our classical scholars than they now are.

To the theological student and inquirer into Christianity, the celebrated Wolfenbüttel Fragments above-mentioned, with the controversy arising out of them, present a most attractive subject of study. Tangible literary result, indeed, there is here none; but there is that which, with a candid mind, necessarily leads to a result—a learned and well-pleaded statement on both sides of the most important case that can be brought before the moral faculties of man for decision. Lessing's connection with the theological literature of Germany is, indeed, one of the main features of his literary existence. "I have always remarked," says Nicolai to him, (letter 57,) "that you had an itch to come to close quarters with the theologians," (*einen Kitzel mit den Theologen handgemein zu werden*;)—and what is more remarkable, the same Nicolai assures us, (letter 47,) that it was the intention of his speculative friend, by the publication of the Fragments, to do a service to that very orthodox party of the Church who were most severe in censuring him, and most loud in condemning. It is certain, also, that Lessing, through his whole life, showed a greater inclination to consort with that party in the Church whom we in England call Evangelical, than with the Rationalists. When in Hamburg, he praised the orthodox preacher, Goetze, and gave the go-by to the rationalist, Alberti, who preached smooth, moral doctrine to the fashionable taste of the time, as Blair not long afterwards did in Scotland. He also expressed himself very strongly against the irreligious tone, under the influence of the Great Frederick, then fashionable at Berlin. There was some talk, in 1769, of a project by Joseph to establish a colony of German literati at Vienna, something similar, perhaps, to what the Grand Duke Charles afterwards realised at Weimar. Nicolai, who was a staunch Protestant, and in theology a liberal somewhat of the Blair and Spalding

school, was inclined to look with suspicion on any project of this kind emanating from Vienna. Lessing took more comprehensive views, and wrote some remarkable lines to Nicolai on the subject, which the length of this article will not permit us to extract.*

"These modern heterodox have no consistency or keeping in their system!—*sind inconsequent*," Lessing used to say; and on the same principle of honesty and consistency he defended the Trinitarians against the Socinians. Hence the respect with which he is always named by Schlegel, Menzel, and some of the most religious writers among the German critics.

Menzel again sees in Lessing a most pious and thoroughly Christian man, though he laments that the Fragments should ever have been published, to furnish, as they have done, an armoury of irreligion to all the Heines, Gutzkows, and Wienbargs, who have since set them publicly forward to scoff recklessly at things most sacred. But with Menzel, as with most Germans, Christianity does not imply revealed religion, an extraordinary system essentially different in kind from the regular course of divine providence; it means, Monotheism, virtue, immortality, as opposed to Pantheism, sensualism, absorption into the absolute; it means, according to a distinction which Lessing himself uses, the religion which Christ exercised towards God, not the religion which Christians exercise towards Christ.

Nicolai and Mendelssohn were very wroth with Lessing for publishing the Fragments, not, as it should seem, because they were more orthodox than Lessing, but because they were fond of peace in these matters, and thought that where from the weakness of human nature, calm discussion was impossible, it was better to avoid public discussion altogether. They felt strongly perhaps, but applied wrongly, that beautiful sentence of Herder, "*Ueber Gott werd' ich nie streiten*."

The worthy bookseller indeed was habitually as shy of theological, as Goethe afterwards was of political polemics; and indeed it is manifest that the same reasoning applies to both. Both are disagreeable to peaceful and poetical minds; but both are necessary on occasion, and will be shunned by weaklings and worldlings only. Whether, on any particular occasion, a man should rush into the teeth of established opinion, whether political or theological, will always be a question of great difficulty. Prudence and a regard to personal convenience, will often dictate silence, where

* They will be found in Menzel, D. L.

earnest conviction demands and a healthy sincerity of temper rejoices in discussion. It is unquestionably more noble to err on the side of sincerity and truth, whatever may be the consequence.

The contents of the *Wolfenbüttel Fragments* may be guessed by a glance at the titles :—

1. On the Object which Jesus and his Disciples had in view.
2. On the Toleration of Deists.
3. On the Custom of declaiming against human Reason in the Pulpits.
4. On the Impossibility of a Revelation which all Men could be brought to believe with a rational Conviction.
5. On the Passage of the Red Sea.
6. That the Books of the Old Testament were not written for the purpose of revealing a Religion.
7. On the History of the Resurrection.

From these titles the theological student will perceive that the subjects which Reimar handled are pretty much the same as those which had been taken up by his predecessors, the English deists. Indeed, there is nothing in this writer of that imaginative, poetical, or transcendental cast, which is wont to bewilder us in the orthodox, as well as the heterodox theologians of later Germany. Goethe, Herder, Schiller, Wieland, Richter, Kant, gave every thing a swing. Even on the most dry, erudite subjects, no person could talk in plain prose. But Reimar belongs to the old school; less ambitious of being intellectual, more certain of being intelligible. There is no mistaking what he would be at; no Hegel, in ambiguity felicitously profound, claimed by Macheineke to-day, by Strauss to-morrow.

This plain-spoken phrase was no objection to Lessing;—Lessing in his zeal for theologizing so perfectly German, in his manner of theologizing so thoroughly English. His own views of the matter are well explained in his own comment on the tracts.

We regret that our limits compel us to omit Lessing's own criticism on the tracts, and also some choice extracts from the celebrated reply of Goetze, the pastor primarius of Hamburg.

We do not flatter ourselves to have succeeded by this hasty sketch in giving to the reader who has not studied him, a perfect idea of Lessing; but if the student wishes to know him properly, he must see him fighting his battles, and in those battles, he is not to contemplate chiefly the matter of the dispute, but the fine play of the muscle, the sure aim of the stroke, the position of the combatant wisely chosen and maintained with a kingly attitude. A hireling fencer certainly he is not; but you will often be surprised, after much preparation, to see this

Titan take his stand against Jove in behalf of some climbing boy, or a poor penniless beggar—some stray heroism on earth not loudly sounded, but recorded by an angel in heaven.

There are few men from whom the professional scholar and literary man can drink in a nobler spirit; few who can afford more valuable aid in that most difficult task—the formation of a literary character. Perhaps Fichte may lecture more scientifically, but Lessing gives us more varied and more interesting exemplifications; he is the very eye of inquiry, the sword of research; the Prometheus Purphoros of the multitudinous world of books, a world, which, if one is not taught to use it wisely, instead of being an inexhaustible armoury of Pallas, will eat into a man like a cancer, and ossify him to the very core. We therefore recur to what we set out with, and urge the study of Lessing upon our studious youth, not for that part of him which appears tangibly in finished works upon paper, neatly inventoried by historians of German literature; but for the spirit of truth-worship which breathes in all his works; for those high lessons in the noble art of intellectual gladiatorship, which his example supplies. We do not wish to overpraise him. We are no blind devotees of German literature. Where, indeed, shall we find in that region the breadth of easy strength, the "Lions at play," which a Rubens might paint, and a Shakspeare dramatize? If Goethe was a Hercules, Weimar was to him an Omphale, in whose arms the man of muscle, before he had performed half his feats, was fondled into effeminacy. The poet of Faust had mass and luxuriance, but he wanted manliness. Lessing wants mass and luxuriance, but he is a beau-idéal of vigour, intellectual and moral. Menzel is right when he eulogizes him as the manliest man that the Germans have; and they who study the art of studying under him must be accordingly. It is pleasing to trace in him, amid his unsettled notions, no wish to destroy what is beyond price in the eyes of many. Not a particle of the sneering infidelity, the literary baseness, the foul dishonesty of quotation, the vile flippancy, and the still viler raillery in the room of reason, that brands the school of Voltaire, debases Lessing. We cannot believe that he published the *Fragments* with the design of aiding the cause of religion; but we are quite assured that he would not have relished their modern termination in Strauss. He probably wanted to see Christianity defended from the force of all objections that had seriously affected himself, and found in the *Wolfenbüttel Fragments* the "Origo

mali." In putting forth these papers for the solution of theologians, he would not improbably have rejoiced in a successful combatant against these corroding doubts; but he never lived to see him armed at all points for the conflict with Rationalism and Neology. Had he placed religion in her united sovereignty over the feelings, affections and reason, he would have done well; but he sought to confine her to the latter, which is not half her empire. Archbishop Leighton rightly says, "Never be afraid to doubt, if only you have the disposition to believe; and doubt, in order that you may end in believing the truth." To this state the wise archbishop puts a limit. The student of Lessing must take this for a motto.

ART. II.—1. *Lettre sur le Saint-siège*. Par M. l'Abbé P. Lacordaire, Chanoine honoraire de Paris. (A Letter on the Holy See. By the Abbé P. Lacordaire, Honorary Canon of Paris.) 1838.

2. *Agende für die evangelische Kirche in den Königlich Preussischen Landen. Mit besonderen Bestimmungen und Zusätzen für die Provinz Westphalien und die Rhein Provinz*. (Agendum for the Evangelical Church in the Royal Provinces of Prussia. With particular Dispositions and Additions for the Provinces of Westphalia and of the Rhine.) Berlin. 1834.

3. *Versuch einer Statistik des Preussischen Staats*, bei Voigt. (An Essay on the Statistics of Prussia, by Voigt) 1837.

AMONGST the questions agitated in this reforming age of ours, by far the most important is that which regards the connection between Church and State; though the outcry raised against it in some quarters cannot be more justly qualified than as altogether absurd. On perusing the diatribes on this subject, it is impossible to avoid the sad reflection that the dearly-purchased experience of ages seems to be at times utterly thrown away upon some generations. The ancients, those great masters of political wisdom, have left us, on this subject, lessons which should be constantly inculcated in these days of forgetfulness. They had, for instance, no notion whatever how a state might exist of which an established Church should not constitute a vital principle. It is true that society has since undergone great alterations, and we do not overlook the absolute difference between our religion and theirs; but this circumstance only strength-

ens our argument, for had they, like us, been made partakers of Divine Truth, they would have founded their institutions on a basis solid enough to oppose an effectual resistance to the assaults of the philosophic indifference which undermined their religious establishments. To deny, in the first instance, that the State possesses a right to pronounce on the fundamental dogmas of its religion, is a doctrine too absurd to require refutation; and to demand that the Church be abolished, and religious instruction abandoned to the exertions of private individuals, or, to speak more correctly, to chance, is, in our opinion, a proposition fraught with fatal consequences to any State, and to mankind at large. It is our conviction that religion, of which the light is reflected on every action of man, which leads him, as it were, by the hand from the cradle to the tomb, through a dark labyrinth of passion, prejudice, ignorance, error, misfortune and political storm, ought to be made the first care of all governments, and the moment they betray the least indifference to it, they forfeit the high commission they have received, to watch over the welfare of their subjects. That the indifference of rulers in matters of religion has ever been followed by moral degradation, despotism, licence, or anarchy, is attested by every page of history.

These observations lead us to consider the efforts lately made by the King of Prussia to establish a national Church with the view to consolidate the power of the monarchy, which had just experienced a terrible shock from the Roman Catholic party in his dominions. The long and furious religious controversy which has been carried on with Rome must be well known to all our readers; yet though a moderate library might be formed of the publications that have appeared relating to it, the subject is, however, still very far from being exhausted. On the contrary it has been much obscured, owing to the partial views taken of it by writers influenced by political bias; and the question of the newly established Church in Prussia, the subject of the present article, has been very imperfectly adverted to, and, in most cases, entirely disregarded.

Some subordinate questions, bearing upon the subject under consideration, are intimately connected with it; and these we shall first briefly touch upon as far as our limits will allow. We begin by assigning its proper station respectively to each of the three parties engaged in this late religious contest—namely, Prussia, Austria, and the Pope.

The hostility to Protestantism which has been evinced by the House of Hapsburg for

centuries, is well known to all who are versed in political history. This hatred has ever served Austria as a mask for her endeavours to establish her influence in Germany, to the exclusion of Prussia, the only rival capable of competing with her for the prize. The latter, whatever may be affirmed to the contrary, must be considered as the head of Protestantism on the continent, her Protestant subjects amounting to one half of the Protestant German population; and in point of nationality, she is the first amongst the German states; her German population being about ten millions, whilst that of Austria may be estimated at no more than six. These advantages of religion and nationality, united with a high degree of civilisation and civil liberty, gave Prussia a decided superiority in the time of Frederick the Great, who put an end to the Austrian supremacy in Germany. During the French invasion, Austria was deprived of the small remnant of her former influence, which she had continued to exercise through the Pope, by the authority of the latter being then entirely abolished, and a German National Catholic Church was established, of which the primate of Frankfurt, Prince Dalberg, one of the most enlightened men of his age, became the head. The case was different with regard to Prussia who, though humbled to the dust by the reverses of fortune she experienced in 1806 and 1807, preserved influence enough to rouse subsequently the Germans into driving out their foreign masters.

At the re-establishment of peace in 1815, the former advantageous situation of Prussia compared with that of Austria, as regarded Germany, suffered a very unfavourable change. By the acquisition of the Rhenish provinces, and of the Grand Duchy of Posen, Prussia, though she extended her external dominion, did in fact diminish her internal strength. The Roman Catholic inhabitants of these countries, especially of the former, having been again subjected, much against their inclination, to the authority of Rome, Prussia found a most formidable enemy, not only in the Pope, but through him, in Austria, whose former influence over the German confederation was revived at that epoch.

In order to estimate the extent of the danger which Prussia had to apprehend from the Pope, we must view him in his double quality—as the head of Romanism on the one part, and, on the other, as a general in the service of Austria.

Great pains have been taken of late, not only on the continent, but especially in this country, to propagate the belief, that Romanism is synonymous with every kind of liber-

ty as well as the security and order of the state; than which assertion, triumphantly refuted by history, there can be none advanced more entirely groundless. In the language of popery, the state means the Church, and *vice versâ*; excluding the co-existence of any other power, not subordinate to it. The orthodox Papist must look upon every heretical government as illegal, and as that which they are bound in conscience to overthrow. The absolute submission, indeed, which the Pope requires from his followers is incompatible with their duties as subjects of an independent State; and to take one instance out of a thousand, we may refer to the words of a pope's legate addressed to Casimir III. King of Poland. When the latter refused to give the see of Cracow to a Papal nominee, saying that he would rather lose a kingdom than comply with such a request, the legate replied, that it would be better that three kingdoms should perish, than that a word of the Pope should be set at naught. This sublime of despotism is linked with moral degradation of the worst description; one of the Popes, Alexander VI., having boastingly said, that the more foolish a religion was the more fitted was it for the people. To keep the latter in the most abject slavery is the main object of Popery, and this principle was well expressed by a talented supporter* of the system, when he represented the State in the form of a triangle, the top of which was occupied by the clergy, and the body by the king and nobles. The remainder of the nation was left out of his construction. No wonder, then, that in whatever country Popery succeeded in establishing its power, it left behind its pestilential effects not to be obliterated for centuries. Look at the Roman States, the finest district in the world, converted by the Romish priesthood into a morass; look at Spain, Portugal, and Poland, during the sway of the Jesuits, still suffering from its baneful influence. Hence it has been invariably the case that whenever a nation has endeavoured to rise from a state of degradation, it has always shaken off the Papal yoke. And what does Popery say of such spiritual regeneration? Does it not always stigmatize it as the *tyranny of human reason*? Lest we should be accused of misrepresenting facts, we extract a passage from the letter of Abbé Lacordaire, which stands at the head of our article. The Abbé, well known by his controversy with Lamennais, is now one of the most distinguished preachers in France, and a zealous defender of Papacy.

"War," says he, "has been in Europe for fifty years . . . But where is that war? It is higher

* Orichovius.

than opinions, higher than kings, higher than nations; it is between human reason and faith—between Roman Catholic and rational power. The Papal See therefore does not join any party, does not interfere with any form of government, but keeps up a friendly intercourse with every country in which, as for instance in Belgium and in France, the *tyranny of reason* has been put down; it protests against the violence offered to Church and conscience wherever, as in Spain and Portugal, *that tyranny raises its head*.*

Now if these high-sounding words be translated into plain English, the *tyranny of reason*, so much complained of, means nothing more than a purer sense of religion, liberty of conscience, and above all, independence of Papacy: it especially points at Protestantism. In the letter first cited, the Abbé affirms positively that such is the case, and goes on to say that Rome would prefer an alliance with the Greek Church, the most ignorant of all that have ever disgraced Christianity by assuming its name. The Pope excommunicated the Polish clergy in 1832 for the part which they took in the late insurrection. And on what grounds? Because some of the Polish clergy considered a National Church independent of Rome, as the most conducive to the spiritual welfare of their country. According to the Abbé Lacordaire, the Pope considers the broaching of such opinions more dangerous than the slavish spirit of the Greek schism, which so well accords with that of Romanism; and to bring about an union between them is now the policy of the Court of Rome. In the consummation of this design, the Abbé perceives the only means of saving Europe from irreligion. "Make of it" (Greek schism), says he, "Protestantism, and it will become in some respects worse than Rationalism itself (the tyranny of reason), as it would confirm, by a divine sanction, the division of minds. The Greek schism is certainly less dangerous than Protestantism."†

It would appear that the occupation of Constantinople by Russia has found the most zealous supporter in the Pope, for this blessed union of both creeds is to be sealed by an Ukase of the Czar dated from the city of Constantine the Great.

Unfortunately, however, for the Abbé

* Hear the eloquent complaints of Dante, Machiavelli, Petrarca, and Boccaccio, all Romanists as they were, against this enfeebling system to all virility of mind.

† By this the Abbé implies Protestantism itself, not that absurd system gendered by the young liberty of German intellect running into every monstrous night-mare imagining, which we intend to demolish, from Semler to Strauss, in every one of its hydra heads. This, as we have recently pointed out, is the spawn of Deism, and is disowned entirely by Protestants, both in name and principles.

Lacordaire, we can assign less spiritual motives for the Russian sympathies with Papacy. The Abbé Lamennais, whose political and religious opinions we are, however, far from partaking, but whose honesty is above suspicion, adverting to the same subject, says, that the Pope excommunicated the Polish clergy as a reward to Russia for having guaranteed to him the possession of the provinces called Legations, which Austria at that time seemed disposed to take possession of for herself. This is probably the more true explanation of the Papal policy, the subserviency of which to Austria we shall shortly notice.

The utter helplessness of the Pope in the centre of his own dominions, from which he is in constant dread of being driven by his own subjects, has of late become proverbial. In this state of things, the great influence which he still exercises in some foreign countries, and especially the formidable resistance which he recently made in the contest with Prussia, would appear an anomaly, were it not certain that the Pope is actually a subservient agent in the hands of Austria. The times when the thunderbolts of the Vatican humbled to the dust the Emperors of Germany are long past; the Popes have now in their turn found masters in the Emperors of Austria; very mild ones, it is true, but still masters. We have already stated one fact in support of this assertion, and a few more will place it beyond doubt. About the close of the last century, a Pope travelled to Vienna, in order to implore, though in vain, Joseph II. not to prosecute his ecclesiastical reform commenced by the abolition of monastic orders. The Romish clergy in Austria must be very tolerant, and say nothing against mixed marriages, about which such an outcry was raised in Prussia, and which subject we have noticed in No. XLIV. The members of the imperial family often intermarry with Protestants, and even with Greeks, and the validity of such unions is never questioned. When on the occasion of the death of the Lutheran consort of the Archduke Charles, the monks of the Capuchin convent, which contains the vaults of the imperial family, ventured to express some scruples about admitting the body, the Emperor Francis told them to be quiet, on pain of being abolished. This subserviency of Rome to Austria has much increased of late, since the latter has become an immediate neighbour of the Pope, whom it supports against his own subjects, and whom it might deprive of a part of his dominions. The cabinet of Vienna avails itself of the influence it possesses over Papacy either to extend its

political power, or to keep down countries the allegiance of which to the house of Austria seems doubtful. With this view, the order of Jesuits has been revived, and an attempt was made to introduce them into Hungary, but was successfully opposed by the people on constitutional grounds; but in provinces not enjoying the benefit of a constitution, as in Galicia, the Jesuits have been established since 1815. These moral poisoners of nations, now no less dangerous than the Northern Colossus to the civilisation of Europe, have been also planted in some of the minor German states bordering on Prussia, and which are under the exclusive influence of Austria.

Backed on one side by the powerful support of Austria, and on the other by the advanced ranks of the well-disciplined army of Loyola, the Pope came forward after the peace of 1815 to negotiate with the cabinet of Berlin in favour of the Romish Church in the Rhenish provinces. The conditions he proposed must have been very exorbitant, since five full years elapsed before the parties concluded an agreement. The Pope's bull, *De Salute Animarum* issued on the 16th of July, 1821, and soon after sanctioned (the 23d of April) by the King of Prussia, must be regarded as the Prussian concordat. The conditions are most unfavourable for Prussia, when contrasted with similar agreements contracted by the smaller German states; and on its contents being made known it excited the greatest astonishment; for whatever was clear in the document, gave immense advantages to the Romish See, whilst the remainder was couched in ambiguous terms, from which much evil subsequently originated. By this concordat, the Pope obtained the right to nominate, during six months of the year, all prebendaries, deans, and provosts; and during the other six months, the nomination was entrusted to the bishops of Cologne, Treves, Paderborn, and Munster. In questions of organization only, was the royal placet required. Besides these great advantages, the Romish Church was rendered entirely independent of the political government, not only in matters of religion, but even in its revenue, by the enactments of the Diet of the German Confederation, guided at that epoch by the influence of Austria.

Prussia was at that time in a very perplexing situation, owing in the first instance to the imprudent promise she had made, in the hour of her distress, to introduce a representative form of government; which if granted, must, considering the heterogeneous character of her subjects, have ended in the dissolution of the monarchy. The dis-

satisfaction which followed the non-performance of this promise was very considerable; and almost every German state found itself in the same predicament. The fear that social order in Germany might be disturbed by internal revolutions was not a vain one; and the Austrian cabinet availed itself with great skill of this apprehension, to draw her Prussian rival into adopting coercive measures to suppress the political excitement of the Germans. On the same grounds, Prussia was persuaded to grant the Romish Church such exorbitant privileges, forgetful that Ultramontaniam associated in the minds of the Germans with every species of bigotry and ignorance, would only serve to promote the views of her antagonist. The decay of Prussian influence in Germany, and which is now almost extinct, may be dated from that epoch.

The *imperium in imperio*, introduced into Prussia with the establishment of the Romish Church, the cabinet of Berlin endeavoured at first to soften down by promoting the diffusion of knowledge, by an enlightened system of education in the schools and universities, by the impartial administration of justice, and by a comparatively free press. The plan was attended with marked success, so long as affairs were directed by Prince Hardenberg; but the death of this distinguished statesman in 1830, and that *pression du dehors*, consequent on the many political revolutions that broke out at that epoch in different countries, wrought a total change in the policy of Prussia. She now cordially joined Austria in passing measures devised by the diet of Confederation in 1832, for the subversion of all public liberties. Austria, who had remained stationary for the last three centuries, and had consequently no improvements to check, was the only gainer by it; whilst Prussia, whom the Germans had been accustomed to look upon as their leader in the advancement of national civilisation and political power, found that their minds were alienated from her, and that her influence on the affairs of the Confederation had sustained a most serious injury. Prince Metternich, who had been waiting all along for this catastrophe, then perceived that the time was arrived for overwhelming his Prussian rival, and he accordingly let loose the Pope and his host of priests upon him.

The first blow was aimed at the cause of enlightenment by ruining the college of theology at the University of Bonn, under pretence that the doctrine of Hermetes, one of its professors, was heretical. The fact is, he taught that the tenets of Romanism are not contrary to the postulates of reason, a doc-

trine which, previous to 1832, had been found so good, that it was even expounded at Rome. Professor Günther at Vienna goes a step further and teaches that Romanism is in accordance with the postulates of reason, and yet it was by no means the Pope's intention to excommunicate him. But this was, as is evident, a mere mask for attacking the Protestant religion. The second act of this drama was the affair of mixed marriages, which we pass over, as the subject has been amply discussed in a former article of this Review.* The only plausible ground of complaint against the Prussian government in this disgraceful conduct of the Romish clergy, is the forcible removal, without a previous trial, of the Archbishop Baron Droste from the see of Cologne. The extraordinary circumstances attending this measure may, however, palliate it; as there existed no doubt as to the guilt of the archbishop, who acted in open defiance of the laws which he had engaged to respect, and had actually declared war, by seditious appeals to the people. He was treated as a prisoner of war. There cannot be any doubt that he was the agent of a foreign intrigue, ready to take advantage of any popular excitement in case of his trial, and this is evident from the character of the deputation sent by the Westphalian nobility to implore the king to bring the archbishop to a trial, which deputation was headed by a relation to Prince Metternich. Bavaria, under its priest and Jesuit ridden king, was the hot-bed of this intrigue, and from thence the Rhenish provinces were filled with inflammatory pamphlets, which, but for the timely interference of Prince Metternich, must infallibly have led to open war.

These machinations of the Romish Church assumed a very serious character, not only through the active co-operation of Bavaria, to which we have already alluded, but also through the threatening attitude taken by Belgium, which is at this moment the chief seat of the Jesuitical propaganda, and whence some disciples of Loyola were actually smuggled into Rhenish Prussia. To the same dark source of intrigue, and especially to the more direct influence of the Jesuits established in Galicia, may be traced the counterpart acted by the Archbishop of Gnesen and Posen, M. Dunin, with regard to mixed marriages, which affair commenced as soon as that of Cologne was over. As this question is intimately connected with the subject under consideration, and has not yet been mentioned in this Journal, we think

it advisable to give a few details concerning it.

In the Grand Duchy of Posen, children born of mixed marriages were to follow, not as in the Rhenish provinces, the religion of the father, but that of either parent, Protestant or Catholic, as might be agreed upon by the parties. To such marriages the Romish clergy were accustomed to grant their benediction, without exacting any promise from the Catholic party that the children should be absolutely educated in the Roman creed. This practice, which the Prussian law renders compulsory on the clergy, had continued without resistance on their part since 1815, in which year the Grand Duchy of Posen, which had been separated from Prussia by Napoleon in 1807, was again made a part of her dominions. The practice would have no doubt been quietly continued, as the natives to the duchy being for the most part Poles, both Catholic and Protestant, and frequently united by family ties, members of the same family often belong to different Christian persuasions; had it not been for the unexpected opposition raised by M. Dunin, the Archbishop of Posen and Gnesen. This prelate, who, like his predecessors, had all along suffered mixed marriages to be blessed by his clergy, now affected scruples of conscience, and felt himself bound to proclaim such unions to be contrary to the spirit of Romanism, and to the laws of the Catholic Church guaranteed to it in the Grand Duchy of Posen in 1815. It seems, however, that he was at first not quite certain of his right, as instead of denouncing by his own spiritual authority the practice in question as illegal, he applied to the king for permission to do so, remarking that the existing laws of the Prussian monarchy were at variance with the papal decrees—namely, with the breve of Benedict XIV. issued to the Polish bishops in 1748, and with that of Pius VIII. issued in 1830, to the Archbishop of Cologne, which condemned in strong terms the practice actually prevailing in the matter of mixed marriages. With regard to the breve first mentioned, the Prussian ministry observed to M. Dunin that it had been subsequently abrogated by the Polish diets; and with reference to the second, that it in no way binds him, having been exclusively intended for the Rhenish provinces, with which the Grand Duchy, from the peculiar character of its national institutions, had no analogy whatever, either political or religious. Should a different meaning be attached to that document, it might be affirmed with equal justice that some particular clause in the concordat between Rome and Berlin would be

* See No. XLIV.

obligatory to the Roman Catholics of Ireland, which is too absurd a doctrine to be thought of. In another application addressed personally to the king, besides the foregoing arguments, the archbishop urged, and we think with more justice, that the Romish Church ought not to be compelled to administer the sacrament of marriage in direct violation of its principle; that should the compulsion be enforced, he would allow his clergy, but on the condition, *sine quâ non*, of both parties taking a solemn engagement that their children should be educated in the Roman Catholic religion. From this latter source have arisen all the difficulties both here and in the Rhenish provinces, and we think that the Prussian government has been decidedly in the wrong on this point. By compelling the Romish clergy to bless mixed marriages, the officiating of a Protestant priest alone being deemed insufficient to ensure the validity of the marriage, the king actually encroached on the spiritual prerogative of the Pope, whilst the abandonment of this condition would have as fully answered the purpose. It is thus that affairs of this kind are managed in Russia, and Rome does not venture to object to the practice. There children born of mixed marriages must absolutely be brought up in the Greek creed, and the matrimonial tie is considered binding though administered by a Greek priest alone. On this account marriages between Protestants and Greeks, or the latter and Roman Catholics, are very scarce in Russia, as the persons contracting them know beforehand all the consequences of such unions.

These communications between the Archbishop of Gnesen and Posen and the cabinet of Berlin took place towards the close of the year 1837, and as diplomatic negotiations between the latter and the see of Rome, on the subject of mixed marriages, were still going on, it was expected that both parties would at length come to a mutual friendly understanding. M. Dunin, however, did not wait for the result, but as if all his previous correspondence were a mere manoeuvre to enable him to take more decided steps, he began to act in open defiance of the government by addressing the following circular, dated Posen, 17th February, 1838, to the clergy of his diocese:—

“Reminded by the allocution which the visible head of our holy Church, Pope Gregory XVI., delivered on the 10th of December last year, and in which he condemns as perverse the practice introduced into the kingdom of Prussia with regard to mixed marriages, of a former bull, much esteemed by us, addressed to the primate, the archbishops and bishops of the ancient kingdom of Poland, and ordered to be observed in all times, namely, that no

Roman Catholic willing to enter the matrimonial state with a dissenter, and *vice versâ*, shall be admitted to the sacrament of marriage, performed according to the ritual of the Romish Church, until he shall produce sufficient guarantees to the following effect:

“1. That every child born of such marriage shall be bred up in the Roman Catholic religion.

“2. That the Roman Catholic party shall be secured from all attempts at conversion.

“3. That there shall exist some hope that the dissenting party will be brought within the pale of the Roman Church.

“That such is the Catholic doctrine, is proved by the more recent breve of Pius VIII., dated in 1830, beginning with *Litteris altero abhinc anno*, which was issued at the request of the bis ops of the western provinces of Prussia, allowing the clergy to give their benediction only under the above-mentioned conditions. Yet as sad experience shows that in many places priests have forgotten that injunction, do not wonder, therefore, reverend fathers, that your archbishop, who is called by the Holy Spirit to watch over the sanctuary of Christ, whilst lamenting such frequent sacrilegious administration of the sacrament of marriage, should decree penalties against the transgressors of this law, that at least the present and future spiritual fathers may be deterred from a similar sacrilegious distribution of the sacrament to those who are unworthy of it, (*a sacramento indignis sacrilege administrando*.)

“For this reason we suspend, dating from the present moment, every priest in our diocese from his clerical function, office, and benefice (*suspendimus ab omni ordine, officio, et beneficio, ipso facto*), who shall in defiance of the literal meaning of the above-mentioned decrees of the Holy Church, dare to administer the sacrament of mixed marriages; that is, of a Catholic with a Dissenter, and *vice versâ*, according to the Roman ritual,—or to give his approbation in any way to the said marriages; unless the dissenting party offers first a sufficient security that all children of such marriages will be educated in the Catholic religion. We subject to the same penalties every priest who shall not exert himself to his utmost power, in order to impress on the minds of his flock that such marriages are illicit, and strictly forbidden by the Church (*talía matrimonia esse prorsus illicita et ab ecclesiâ severe prohibita*).”

It requires little attention to perceive that the archbishop, by the above document, went beyond the limits of his spiritual authority. Instead of a passive resistance, he recommended to his clergy, under severe penalties, an active propaganda amongst the Protestant population. By threatening every refractory priest with the loss of his office and benefice, he acted in direct opposition to the existing laws, which do not admit of such proceedings but with the concurrence of the civil authorities. Upon such grounds the circular of the archbishop was cancelled by the ministerial order, dated 25th June, 1838, and an injunction issued that the existing laws regarding mixed marriages should remain in force. The conduct of the government towards M. Dunin was marked with more moderation than in the case of the Archbishop of Cologne; he was neither to be suspended from his office nor forcibly re-

moved from his see, until he should have had first a fair trial. But now a new difficulty arose, as to who should try him. The archbishop insisted upon his immunity of civil tribunals, affirming that he was amenable to ecclesiastical courts alone. This privilege the Polish clergy had long tried to assert in ancient Poland, until it was at length decreed that being citizens of a free state, they were amenable, like every other individual, to the tribunals of laymen, for offences not of an ecclesiastical nature. It appears that the Prussian government acted upon this decision, and deeming the archbishop guilty of a breach of the existing laws, ordered him to be tried by the upper tribunal of Posen, which condemned him to six months' imprisonment in a fortress. The following paragraph, which appeared in the official gazette of Berlin, explains the ulterior history of this sentence:—

“The sentence of the upper tribunal of Posen, pronounced on the 28th February, 1839, against the Archbishop Dunin, in consequence of his appeal, made on the 23d of April, to the king's mercy for a mitigation of it, was modified by a ministerial order of the 20th of May this year, so that the six months' imprisonment in a fortress was cancelled, and the removal of the archbishop from his see delayed, until it could be ascertained whether there did not exist some means of conciliating the duties of this office, such as the archbishop conceives them, with the existing laws. As in the actual state of things the archbishop could not be permitted to return to his diocese, he was informed that he must not leave Berlin without permission from the minister for ecclesiastical affairs, but that he might, after a previous communication with the said minister, betake himself to any place he should choose in the Prussian dominions. Contrary to this royal prohibition, repeated in a cabinet order of the 10th of September, the archbishop secretly left Berlin on the 3d of October, and returned to Posen, in order to take possession of his see. This fresh act of disobedience compelled the royal government to remove for a second time the archbishop from his see. In consequence of a royal order he was removed, and confined in the fortress of Colberg until it shall be otherwise determined.”

There cannot be a doubt that M. Dunin was throughout the whole affair urged by foreign influence to pursue a line of conduct so much at variance with the frank, generous and honest character, which even the opponents of this prelate allow him to possess. But such is the nature of Papacy that, like every unprincipled despotism, it must ultimately bring dishonour upon those who devote themselves to its interests. The Pope eulogized to the skies the conduct of M. Dunin, in an allocution delivered on the 13th of September, last year, in which, amongst other things, he said—

“We take heaven and earth to witness, that we bitterly lament whatever has been done to the pre-

judice of the Catholic faith in the kingdom of Prussia. One circumstance, however, brings us relief in our affliction, namely, the unshaken firmness which the Archbishop of Posen and Gnesen, a worthy champion like the Archbishop of Cologne, has shown in defending religion and the discipline of the Church in the matter of mixed marriages.”

After the removal of the archbishop, the General Consistory of Posen ordered on the 10th of October, a general mourning, prohibiting the use of organs, bells, and music, in all churches, and calling upon the faithful to carry the mourning into their domestic circles. This measure is alluded to in the following terms, in a letter dated Posen, the 15th of October, last year:—

“Last Sunday, after church service, it was announced from all the pulpits that, in consequence of the forcible removal of the archbishop, a general mourning is to take place. Henceforth the ringing of bells and music is to cease. It has also been enjoined to all the faithful that they should observe mourning in private. Letters from the country mention that the clergy, on account of the mourning, refuse to bless marriages, which must at least be celebrated without. Those who know how much importance the Polish peasantry attach to the wedding music, will easily imagine the great sensation produced amongst them by this prohibition. After the departure of the archbishop, a decree left by him was immediately published, suspending from their functions the chapters of Posen and Gnesen, leaving them only *curam animarum*. All ecclesiastical government is therefore disordered; it exists no longer.”—*Swabian Mercury*, 27th October.

The result of all these proceedings, as in the Rhenish provinces, was an extraordinary excitement amongst the people, thus led to confound the intrigues of Rome with the persecution of their nationality, and little was wanting to set the country in a blaze,—a consummation devoutly desired by the Pope. For what would be the consequence of an insurrection at the present moment in the grand duchy of Posen, which would spread conflagration through the Prussian dominions?—That Russia and Austria would interfere with an armed force, as they are bound to do by the treaty concluded at München-Gratz, in 1835, between the three powers, should an insurrection break out in any province of ancient Poland. Austria would seize upon Silesia, torn from her by Frederick the Great, and Russia upon the grand duchy of Posen; and this would precisely answer the views of the Pope, to whose sympathy for the Czar, and his preference given to the Greek schism over Protestantism, we have already referred. This would also be in accordance with the rallying watchword of the Jesuits, who used to say that it was better to give Poland over to the Muscovites than to the heretics. Our

opinion is fully borne out by the recent conduct of the Pope towards the Emperor of Russia. In the beginning of the last year, no fewer than four millions of Poles belonging to the Greek church, though acknowledging the Pope as their head, were compelled to exchange him for the Czar, and some of the refractory priests were either banished to Siberia, or incorporated as privates with the regiments of the line. And what said the Pope to this violence of conduct? Did he protest then as boldly as he did in reference to the King of Prussia? Nothing of the kind. He condescended to crouching flattery, having said, amongst other things in his allocution, delivered on the 22d of November, last year—

“We have taken every possible step to remedy this state of things, and we will yet address ourselves to the mighty Emperor, because we expect from his impartiality, from his noble and generous character, that he will listen to our appeals and wishes.”

The Emperor, however, caused the Pope to be told that unless he remained quiet, he would at once put an end to his authority in Poland, by appointing a Pope of his own, and immediately prohibited the Polish bishops from holding any intercourse whatever with the see of Rome. The fact is, that some of the bishops, instead of shepherds, proved wolves, and had sold their sheep long before their congregations were aware of it; the abject ignorance in which the Romish priesthood kept the people prevented them from perceiving the truth. Thus it appears that the degrading system of Popery proves a two-edged sword, with which it destroys both itself and its followers; and in this we must perceive the finger of Providence, which grants success ultimately to a just cause alone.

The little we have said respecting the proceedings of the Romish clergy in Prussia, is sufficient to justify the assertion that had they been suffered to run their full course, the ruin of the Prussian Protestants would have been inevitable. This supposition becomes certainty, when we contrast the strict soldier-like discipline of the Romish church with the disunited state of the Protestants. The Roman Catholic clergy enjoys in Prussia many advantages not possessed by the Protestant, and compared with the latter is enormously rich. The Roman Catholic clergy numbers two archbishops, two prince bishops (*Fürst-Bischöfe*), three bishops, eight suffragan-bishops (*Weih-Bischöfe*), twenty-five prelates, ninety-nine canons. The total number amounts to 8539; whilst the Protestants have only four

bishops, 369 superintendents, and 5720 prebendaries. The Roman Catholic population and the Protestant are as 5 to 8, there being five millions of the former, and only eight of the latter; but this numerical disparity is fully compensated by the advantages which we have already mentioned are possessed by the former. Add to this the support of the Pope, of Austria, of Bavaria, and of the Jesuits, and no doubt can remain that in a contest between Romanism and Protestantism, the latter must inevitably succumb. This was the fate of their Protestant neighbours in Poland, who, though at one time more numerous than the Romanists, were yet entirely oppressed, owing chiefly to the want of union amongst themselves.

These weighty considerations confirmed the King of Prussia in his former resolution of cementing a union between his Protestant subjects, Lutheran and Calvinist. The task he had imposed upon himself was a difficult one; all similar attempts formerly made having failed, owing to the resistance of the Protestants themselves. It would appear that as far back as the year 1798, the King entertained this wish, having then commissioned three priests of the Lutherans and Calvinists respectively to consult together, and suggest means for the accomplishment of the union. Their labours seem to have been interrupted by the subsequent misfortune which befel Prussia, as nothing further was heard of them. After the peace of 1815, another commission was appointed for the same purpose, composed of the most distinguished divines, and the result of their joint exertions during five consecutive years, was an *Agendum* or New Liturgy, which was first introduced into the cathedral at Berlin, in 1821. The Church thus established was called “Evangelical.”

The principle upon which, according to this *Agendum*, the Calvinist and Lutheran Churches were to unite, was the adoption of a common ritual as regarded the outward form of worship, without compelling either party to abjure any of their fundamental dogmas. The principal difference between the two consists in the words used in the Lord's Supper; the Lutheran form being, “This is the body and blood of Christ;” that of the Calvinist or rather the Evangelical Church being, “This represents the body and blood of Christ.” Such is at least the sense, if not the very words. The royal family themselves belonged to the Calvinist persuasion, of which the followers amount to scarcely one-third of the Lutherans.

The *Agendum* was not introduced into the Lutheran churches by compulsion, as

some affirm was the case, for the very obvious reason that every individual in Prussia being trained to the use of arms, the Lutherans, as by far the most numerous, could have easily resisted any attempt of the kind; nor were any measures taken to procure its immediate general adoption. On the contrary, the government addressed itself to consistories of every province, which had been invited to consult all the members of the clerical body to take into consideration scruples of conscience, long-established church practice, and the customs prevailing in different localities. The project, as had been anticipated, met with much opposition, in part arising from conscientious motives, in part from a philosophic indifference, with which the promoters of the new reform were themselves charged. Upon the whole, however, the result was favourable to the government, as a great majority of the Lutherans embraced the new liturgy without reservation. Such, at least, is the statement of recent writers on Prussia, and especially of the one whose statistical work stands third in the list of publications at the head of this article. We have ourselves had opportunities of conversing on this subject with Lutheran clergymen, and they have usually expressed themselves in these words; "Why, the difference is so insignificant, that I have no objection to adopt the Agendum."

Full thirteen years were taken up in endeavours to persuade the Protestants of various shades to adopt the new liturgy; and it was not till 1834, that the king, assisted by the ecclesiastical advisers of the crown, published an edict giving the sanction of a national law to the Agendum, thenceforth to be obligatory to the Protestant clergy in the Prussian dominions. The Agendum then republished differs from that which appeared for the first time in 1821 only by the introduction of some additional pieces, exclusively referring to the Protestants of Westphalia and of the Rhine. These concern only certain outward forms of worship, principally sanctioned by custom, and which are to continue obligatory only in these localities. The royal edict is a document of great importance in this matter, and contains both a justification of the measure, and a succinct narrative of the proceedings connected with it. We reprint here the principal part of it, as it appeared along with the Agendum published at Berlin in 1834.

"Our ancestors, as well as all other sovereigns who, at the time of the Reformation of the Church, accepted, together with their subjects, the restored, pure, evangelical doctrine, soon discovered that there existed an urgent necessity for introducing

into their territories certain Church ordinances and agenda, which, without infringing on the dearly-bought liberties of belief and conscience, should produce a salutary unanimity in the forms of Church service, and should set a limit to the rapidly spreading licence of opinion which is entirely opposed to the object of the Reformation. By means of these Church agenda, drawn up principally by distinguished divines, and under the especial guidance, and with the counsel, or, at least, in the spirit of the Reformers, and introduced by the sovereign sanction and command, an almost general unanimity in matters appertaining to Divine service was diffused throughout the Evangelical Churches then forming themselves through Germany, inasmuch as these agenda were all regulated according to the same principles. For centuries these excellent Church ordinances maintained themselves in their original form and holy usages; but in proportion as erroneous views of Church affairs, a spirit of innovation, lukewarmness and indifference continually gained ground, they fell by degrees into such great decay and oblivion, that in most places scarcely a traditional recollection of them was preserved. It had long been the heartfelt wish of all those who seriously desired the internal peace and firm unity of the Evangelical Church, that some bounds should be set to the disorder and licence arising from the above named causes. There was but one means of effecting it, and this was to endeavour, before all, to rescue those truly Christian ordinances existing in the Evangelical Church from oblivion, and to restore them to life, having, however, at the same time, due and sufficient regard to the necessary requisitions of the age. This consideration was the original cause of the Church Agendum, which appeared first at the close of the year 1821, and subsequently with improvements and alterations for the cathedral at Berlin. The approbation bestowed upon this Agendum, which was drawn up according to the above principles by several esteemed divines, enjoying a high reputation, and who were well acquainted with our views, immediately excited the repeatedly expressed desire that measures should be speedily taken for the general diffusion of the same. In order to promote this, there soon after appeared the preliminary requisition approved by us, and addressed to the clergy of every province, in which they were called upon to declare themselves either for or against the reception of the same. Notwithstanding the violent and unjust attacks of the opponents of the Agendum, the result might still be called most favourable, as by far the greater number of the Evangelical Churches in a very short space of time declared themselves in its favour. In order, however, to justify the non-acceptance of the Agendum, many scruples were brought forward, and wishes expressed often of a very contradictory nature, as would necessarily be the case under the prevailing circumstances, some of which were grounded on local considerations, and some had their rise in attachment to established custom, or other considerations, associated with a variety of other motives. In order, therefore, to proceed in this matter, as it was our wish to do, with all possible indulgence, and at the same time with due regard to provincial customs, which were appealed to in the exposition of many of the said wishes, so far as by their nature they needed not to be viewed as in any respect unfitting, we caused such scruples and proposals to be collected and arranged by the provincial consistorial courts, in order then to be submitted to the careful consideration and judgment of a special committee, consisting of the spiritual council of the provincial consistory and of several of the most esteemed divines of the pro-

vince, and we further ordered that the result of this proceeding should be reported to us by the council for ecclesiastical affairs. Accordingly, after a similar process had taken place in the provinces of the Rhine and those of Westphalia, though modified according to the constitution of the Church in those districts, we ordered the proposed and accepted acquiescence in this new and still further improved Church Agendum, which we had caused to be prepared in order that thenceforth the whole might appear in better and more appropriate connection. to be received. Such objections as were grounded only upon one-sided views and wishes, and did not contribute to the general confirmation of the whole, were not included, in order that the greatest possible universality, the fundamental principle of the Agendum, should be preserved. At the same time both the provincial consistories were instructed to proceed respecting them with due consideration, and provided with full power to that effect."

The royal edict was accompanied by a short introduction, drawn up by four ecclesiastical councillors of state, all eminent by their learning and high station—namely, Drs. Eylert and Neander, both evangelical bishops, Dr. Ehrenberg, and Dr. Therman. Their approbation of the Agendum is expressed in the following terms:

"We feel ourselves bound, as the ordained and appointed ministers of the Word, to declare further, that, according to our firm conviction, the Agendum fully agrees in all its parts with the precepts of the Holy Scriptures as the sole rule of faith in our evangelical Church, as well as with the precepts of the same derived therefrom."*

After a minute examination into the different parts of the Agendum, we do not hesitate to subscribe to the opinion above expressed. We have looked in vain for those articles of the Agendum in which, as some of its opponents assume, it is said that love is inculcated towards the king, and only praise to God. The endeavours of some members of this opposition to bring the Evangelical Church into ridicule may be traced either to the political persecution they had suffered, which originated from entirely different causes, or to the religious scepticism, indifference, and cosmopolitism, so much advocated by some writers of the modern German schools. The Jewish Heine, for instance, affecting the wit of Voltaire, sarcastically assailed it in the following words:—"And the king's Agendum, carried on the wings of the red eagle, third class, flies from church steeple to church steeple." The king did in fact confer that

order on many clergymen who had distinguished themselves by their zeal in promoting the union of the two principal Protestant creeds, which was unquestionably a highly meritorious and patriotic work; nor can we attach any blame to the conduct of either party so far as it was actuated by conscientious motives, which there is every reason to believe was the case in most instances.

The only part of the Agendum which to us seems objectionable is that clause in the ordination of priests, by which they are obliged to take an oath not only to fulfil the duties of citizens towards the State, but also to denounce traitorous designs conceived against the sovereign. The same objection attaches to the absolute condition enforced upon them, that they must be of unquestionable northern origin. Our objection is not grounded on the nature of these conditions, which may be good in themselves as dictated by political prudence, but exclusively on their being included in an oath in which they are erroneously enumerated amongst the fundamental dogmas of Christianity.

The Agendum having been willingly accepted by a great majority of Protestants, and having, by the royal sanction, acquired the force of a fundamental law of the country, it followed, as a matter of course, that transgressors against it should be visited by corresponding penalties. No government could possibly exist should such right be denied to it. In countries where the people themselves enact their own laws, this right is never questioned. In Prussia there does not exist any legislative body to check the will of the sovereign, but this circumstance does not change the nature of the case; it only represents the king as a *persona moralis*, a collective body, a parliament whose authority is acknowledged by the nation. Prussia, however, is only a nominal autocracy, the king being himself the first servant of the law; and should he become an unprincipled despot, it is certain that, considering the high degree of civilisation and the strong sense of justice, as well as the material means which the Prussian subjects possess, he would not be able to govern twenty-four hours longer. It was by furnishing her subjects with such means that Prussia rose from an insignificant state to the rank of a first-rate power in Europe, and should a different line of policy be adopted, it would prove her political suicide.

But we return to our subject. Against such individuals as should use active means to bring the Agendum into contempt, as well as against non-conformist Lutherans, fines varying from one to fifty dollars, were

* . . . fühlen wir uns verpflichtet, als verordnete und berufene Diener des Wortes, noch zu erklären, dass, nach unserer fester Ueberzeugung, die Agende mit den Lehren der heiligen Schrift als der alleinigen Glaubensnormen unserer evangelischen Kirche, so wie mit dem daraus entnommenen Lehrbegriffe derselben in allen Theilen, völlig übereinstimmt.

decreed by a cabinet order of the year 1834. An occasion for carrying this order into effect was soon furnished by the Lutheran non-conformists, who either congregated in secret places, to receive the Lord's Supper according to the ancient ritual, or preached openly in the schools against the Agendum, or refused to give the names of the priests who baptized their children, as obligatory by the existing laws. Respecting the latter offence another cabinet order was issued, dated the 12th of February, 1838, to the effect that all persons, whether the father or a mere witness, who should refuse, when required by the authorities, to give the name of the baptizing clergyman, should be liable to three months' imprisonment in the house of correction. Several instances of resistance to this order occurred in the Saxon provinces and in Silesia, in which latter place the new Church appears to have met with much opposition. The offenders were sent to prison; but as it appeared that their resistance arose from truly conscientious scruples, they were soon set at liberty, the government wisely leaving to time and to persuasive measures the completion of their work, which a cruel persecution of its opponents would only have counteracted. Such considerations appear to have dictated the following circular order of the Prussian ministry issued on the 14th of June, 1838.

"The circular orders issued by the undersigned ministers on the 12th of February, 1837, have not answered the object they were designed to effect, as the individuals whom they concerned laid so much stress upon the religious scruples they had conceived respecting the evidence demanded of them, and which were in all probability excited in their minds by secret persuasion, that, with some exceptions, they chose rather to go to prison and await their fate in persevering non-compliance till the period of their release. Although there seems to be no room to doubt that a consistent perseverance in the measures hitherto adopted against refractory witnesses would have entirely removed the evil; yet it cannot be denied that, according to the notions conceived by several individuals involved in these proceedings, and who think themselves bound *pro præterito* by the scruples of their misguided consciences, the before-named measures have a character of severity, which might be easily employed by non-conformist Lutherans aspiring to become martyrs, as a means of gaining notoriety, and of exciting their fellow believers to imitate their example. After having therefore considered the state of the case, as well as the circumstances bearing upon it, which shall be duly weighed, with a view to the ulterior measures to be taken concerning the Lutheran non-conformists, the undersigned ministers deem it expedient to acquaint the provincial authorities, that they are to abstain from prosecuting the forcible means hitherto employed, in order to discover the individuals who have performed forbidden clerical functions, and that they shall in consequence release such persons as may have been confined in pursuance of the circular order issued on the 12th of February last year; re-

serving, however, the right of carrying into effect such forcible measures as may be adopted for the future.

"The ministers for ecclesiastical, educational, and medical affairs,

"Signed, VON ALTENSTEIN. VON ROCHOW."

One immediate cause of the above circular may perhaps be traced to two cases attended by unusual harshness, aggravated, no doubt, by the over zeal of some inferior government officials. One of these cases was that of Pastor Augustus Graben of Heliogstadt, who was committed to the house of correction at Erfurt, without a previous trial, and detained there for some months, until he was liberated at the request of the Upper Tribunal of Halberstadt. The other occurred in Silesia, where several fathers of families were sent to prison for refusing to give testimony as to the persons who performed the baptism of their children, but were soon restored to liberty through the interference of the Upper Tribunal of Ratibor. The excitement of these individuals belonging to the class of peasantry consequent upon these occurrences, was so great, that they determined to leave the country for Australia, or some other part of the world. The king did not dispute their right to emigrate, which is possessed by all his subjects; but, foreseeing the hard consequences of their rash resolution, he required, as a condition of their emigration, that every father of a family should prove the possession of 215 dollars, and every other individual of 110 dollars. It would seem, however, that these conditions, which the poor people were unable to satisfy, were dispensed with, as we learn that about 150 Silesian peasants from the district of Trebnitz passed through Berlin during Whitsun week, last year, on their way to Australia, their chosen place of emigration. This occurrence is so much at variance with the benevolent character usually attributed to the King of Prussia, no less than with his recent conduct towards the Tyrolese Protestants, that it has occasioned much regret to the well-wishers of the Evangelical Church. It is only two years since the king granted a hospitable asylum in the same Silesia, and a liberal support from his own purse to about 140 Tyrolese Protestants of Zillerthal, whom a cruel persecution, by the Austrian Romish clergy, had compelled to leave their country, to which their attachment is proverbial. But when the welfare of a whole nation is concerned, the personal feeling of rulers must be silent; and such, no doubt, is the case with the King of Prussia, than whom no one probably more laments the sad necessity which forced a number of his people to leave their country for the sake of conscience.

The cases of Pastor Augustus Graben, and of these Silesian emigrants, have been very incorrectly stated, and the number of the latter strangely exaggerated in a letter published in the *Morning Chronicle* of the 12th of March of the present year. It is as follows :

"Extract of a letter dated Newcastle upon Tyne, 8^{mo} 6, 1839.

"Large bodies of Prussian emigrants are passing through our town on their road to America, in consequence of the persecutions they are suffering at home. They are Lutherans, and the Prussian government is using most coercive measures to induce them to conform to the Reformed or National Church. This they cannot conscientiously do, and severe fines and imprisonment are the consequence. Four companies have already arrived, containing on the average 150 or 170 persons in each, and many more are gone to Liverpool. These have chiefly been under the care of one Pastor Augustus Grabau [Graben?]; he was in the last company with his wife and family, an apparently sweet spirited man. He had been in prison in Heliogstadt for seventeen weeks in the early part of the spring, and was only released on account of severe illness. Another thousand with another pastor are expected daily. They have no introduction to any one here, but soon obtaining notice, a few persons have been down from time to time to inquire into their wants. A public meeting was held on their behalf a few evenings since. There are many poor people and a large number of peasantry among them. They do not in any way ask for pecuniary aid, but receive it with streaming eyes when a little is presented, and acknowledge that in many instances their all has been paid for passage money. Baron von Rohlf has gone first, advanced money and made contracts for them. Some come from Saxony, some from Pomerania, and their first destination is New York. But from the difficulty of understanding them, as they spoke only German, their exact destination was not known. It seems generally acknowledged that the King of Prussia is coercive and arbitrary, though generous and benevolent if people fall in with his views. We have several times attended their services, and been much struck with the solemn awe and heartfelt interest that appeared to prevail. They are well supplied with Bibles and other good books. Their stay is generally short, often but a few hours, and they never come into town, but proceed at once from their steam-boat to the rail-road. Their appearance and circumstances most strongly remind one of the pilgrim fathers and other good men of old; such reverend looks in many cases, such simplicity of attire, such kind affectionate manners, such beaming countenances, plainly showing that many of them must have passed through much, and been tried in the furnace of affliction."

From the same, 2^{mo} 3, 1840.

"You have heard of the deep interest we felt last summer in the circumstances of some hundreds of Lutheran emigrants, who passed through our town on their way to North America. We wrote to Hamburg for further particulars, and eventually a large mass of documents was forwarded. The sufferers never take up arms in their own defence. A most remarkable absence of information on this subject seems to prevail in this country. Prussia has taken extreme care that we shall not hear of it. A vast deal has been said respecting the King of Prussia's kind reception of the Austrian converts

from Popery, but truly his own conduct has been incomparably more intolerant than that of the Emperor of Austria. The tale will probably surprise people, but names, dates and references will be clear, and whoever pleases may do what they can to refute them, or write to the continent, where they must only be confirmed by farther investigation.

"Some thousands more are expected to emigrate in the course of the present year.

"From the last accounts they are suffering great privations in America.

"Six hundred have gone to South Australia; eleven hundred to North America."

Whilst publishing the above letters, the editor of the *Morning Chronicle* did not certainly imagine that a contemporary of his, the *Morning Post*, quite unconscious of their existence, would be inserting on the same day a refutation of them, contained in the following paragraph, extracted from a French paper, the *Gazette of Metz*.

"*Emigration from Germany.*—The *Gazette de Metz* says—The rage for emigration, which for several years past has been depopulating Bavaria, the Grand Duchy of Baden, and part of Alsace, has at length reached our department (the Moselle). Last year a great many families from the cantons of Bitché and Volmunster took their departure for the New World, and last week forty more families, reckoning together about two hundred individuals, left this part of the country for the United States."

The fact is, that the Germans constantly emigrate by hundreds of thousands, neither from religious nor political persecution, but in order to seek their fortune elsewhere, when their prospects grow dull at home. During their long peregrinations they often suffer every species of distress; and it was on beholding a family of these emigrants, composed of aged men, women and children, exposed to extreme wretchedness, that Heine, whilst wandering on the coast of Normandy, burst into the exclamation—"Oh, stupid countrymen of mine! why do you not make thirty-six revolutions, as your French neighbours would do, rather than emigrate?" But the Germans are a quiet, humble, inoffensive race of people, hostile to political commotion, by which, besides, they could gain nothing. Since the re-establishment of peace in 1815, the number of German emigrants may be reckoned at more than a million; most of them went to the United States of America, and amongst them were some political enthusiasts, disappointed at home, and still full of admiration for American republican liberties, which we are now beginning to be able to appreciate. Emigration is most frequent amongst the working classes, and there are actually some hundred thousands of German workmen in Russia and Poland. Their distress has much increased of late, owing partly to the superabundance of population, conse-

quent on a long peace, and partly to the severe system of prohibition introduced by Russia all along the frontiers of Poland, of which restrictions, so injurious to trade, the German press is filled daily with bitter complaints; and no State suffers more by it than Prussia, being the immediate neighbour of her Russian ally.

The circumstances to which we have just referred, probably furnished the King of Prussia with additional reason for persevering in the measures he had adopted for uniting, by an indissoluble tie, his Protestant subjects, by inspiring them with a love for national institutions, so as to render their happiness inseparable from their prosperity. This indeed is, and has ever been, the secret of the greatness of nations. What country could prosper with a population of fortune-hunters, whose political creed is—*ubi bene, ibi patria*? Private individuals may be excused for caring first for their personal prosperity; but rulers have higher obligations to fulfil, being bound to provide for the future safety of the State and the welfare of their subjects, regardless of the censure of their age, which seldom renders them justice. Such is the view which in our opinion should be taken of the question respecting the Evangelical Church in Prussia, and though it should not be crowned with ultimate success, the statesmanlike and benevolent intention in which it originated will be for ever memorable in the annals of Protestantism.

Some time previous to the year 1830 steps had been taken by the king to induce the Protestants of Poland to adopt the *Agendum*, and thus to establish a branch of the Evangelical Church in Kalisch, Warsaw and Cracow. The attempt, however, failed through obstacles of a political rather than religious nature, which it would be superfluous to enter upon here.

We hope that time will remove these obstacles, and that the unmasking of the disloyal and grasping ends of the Papacy, will prove the beginning of an intimate alliance between the principal Protestant countries—an alliance which would have a most beneficial effect on the liberties and social order of Europe, a point of policy which, like several others, has been entirely disregarded by our slumbering ministry.

We may be allowed to take this opportunity of mentioning the high esteem in which our Church, assailed by factions at home, is held by the Protestants on the continent. The approaching celebration of the anniversary of the Reformation in the north of Germany has given occasion to an author to publish one hundred and one theses, of

which the fifty-ninth, referring to our Church, is conceived thus:

“England has ever been an important support of the Evangelical Church in Europe, inasmuch as it has also endeavoured to cause the diffusion of the same in the other parts of the world.”*

If we now consider the general result of the contest of Prussia with the Romish Church, it will strike our attention as a self-evident fact, that the former has entirely lost her moral and political influence over the German Confederation, and more especially over the states of the south. The immediate consequence of this state of affairs was her cementing a still stronger alliance with Russia; an alliance which is much deprecated by her own subjects, who are decidedly anti-Russian. This alternative, it would seem, was the only one left to her, threatened as she was with internal commotions on the part of the Roman Catholic population, surrounded by envious and hostile neighbours, in the midst of whom she stood entirely isolated. To the support of her Russian ally, Prussia looks at the present moment for recovering her former commanding station in Germany, and, if possible, for aggrandizing herself at the expense of the States of the Confederation. All these advantages are to be secured by force of arms, which, but for the intrigues of the Pope and Austria, Prussia would have obtained by the natural progress of things. This posture of affairs is truly ominous to the peace and welfare of Europe. Are there no means left to induce Prussia to change the line of her actual policy? We think there are, and that England possesses them, and that, by making a timely use of them, she may, for a second time, preserve Europe from a despotism a hundred fold worse than that of Napoleon. England needs only to come forward and accept the hand which Prussia is now stretching forth to her. A Prusso-English alliance would be most popular with the people of Prussia and of Germany at large, and of the utmost importance to England in case of her going to war with Russia, which must eventually take place in spite of Lord Palmerston's Russian predilections. Another immediate result of such an alliance would be the affording protection to the Protestants of the German Baltic provinces of Russia, now exposed together with the Romanists to a cruel persecution, and perhaps eventually the incorporation of them with Prussia and the German Confederation; a consum-

* Theses CI.—Zur Reformationen-Feier in Nord-Deutschland. Basel, 1840.

mation devoutly wished by the people themselves, and which reunion would also put an end to Russian intrigues in Germany, the Emperor Nicholas having attempted so lately as last year to become a member of the German Confederation, in the character of representative of the said Baltic provinces. The Northern Colossus, the pressure of which now chokes the breath of Europe, would be shaken from its foundation, and the civilisation of Europe would gain an immense advance upon Asiatic barbarism. For the acquisition of the Baltic countries, Prussia would not hesitate to part with her Polish provinces, the allegiance of which is very doubtful; Poland might be restored to her ancient independence; and thus the protests of our parliament and ministers would cease to be vain professions without meaning.

The objection usually brought against an alliance with Prussia is, that the latter cherishes hostile dispositions towards England, of which the Prussian commercial league, excluding English manufactures from the markets of Germany, is adduced as a proof. This objection is weak, because Prussia by establishing it had a political rather than a commercial object in view—namely, that of preserving her influence in Germany, which had latterly been so much undermined. The prohibitory system introduced by her exists more in name than in practice, English goods, owing to their intrinsic superiority, finding their way into the German markets.

If we dwell upon such considerations, it is because, if they are not the best to be immediately acted upon, they have at least the recommendation of probability, which a wise policy never leaves out of its calculations. Political science has also its fixed, we may say strictly mathematical axioms, upon which an enlightened cabinet constructs its system calculated not for a year, but for centuries and generations. It is said that Napoleon once remarked that he only lived within two years, by which he meant, that he neither imagined nor understood beyond what he was able to realize within two years. Some states, as Russia since the time of Peter the Great, may say that they live within centuries; and it should therefore not excite wonder that she makes dupes of our Whigs, who foresee nothing, and reckon their life, not even by years, but by days, hours, or perhaps minutes.

We have besides hazarded the foregoing considerations with a view to combat a fatal opinion promulgated by some English writers, who, on contemplating the present menacing attitude of Prussia in alliance

with Russia, and impressed by the magnitude of the evil which must result to Europe from it, have drawn conclusions suggested by despair rather than by a just estimation of the actual position of affairs. Those writers say: abandon Poland, abandon Prussia, abandon one half of Germany to the insatiable ambition of Russia, for it is with them a hopeless case. And the next day they would probably advise to abandon to her also all the Continent until the channel should remain our boundary. And what do they propose as the consequence of this? They gravely tell government that it ought to interfere with the internal affairs of Germany; secure, in spite of Austria and Prussia, the rights of political liberty and a representative form of government to the southern states, and unite them into a confederation with the cantons of Switzerland. We have too much respect for our readers to attempt a refutation of such Utopian speculations, the absurdity of which is self-evident.

Another class of politicians, less visionary, but acting from less disinterested motives, and belonging no doubt to the Jesuitical propaganda, wish for the restoration of Austrian supremacy and of Ultramontanism, in order to enlist the Germans in the approaching contest with Russia. The fatal consequences of such a measure need not be enlarged upon. It would render Germany a prey to religious dissensions and social revolutions, and finally plunge her into the horrors of another thirty years' war. Austria, who has remained three centuries behind the other German states, would be compelled to put a violent stop to their progress, while Prussia can to-morrow, if she chooses to do so, place herself in harmony with them, by throwing herself back on the system of her former rational German policy.

The geographical situation of Prussia, considered in a military point of view, is very unfavourable to her, compared with that of Austria and other neighbouring states. Voltaire used to ridicule Frederick the Great by comparing the configuration of his provinces to a pair of gaiters, and his brother Prince Henry affirmed that they wanted logic. Though he removed these objections by the conquest of Silesia and some Polish provinces, yet subsequent acquisitions, sanctioned by the peace of 1815, make Prussia still liable to the same reproach. Her length from east to west, from the banks of the Niemen to those of the Sarre, is 900 miles; from the south to the north her greatest breadth is 390 miles, and her average width is no more than 120. To the disadvantages of such a disproportionate

extent of dominions, owing to which her capital occupies an eccentric position, and which in accordance with the nature of modern civilisation and that of her government, a centralisation of power carried to the highest degree should be placed in their centre, Prussia adds another inconvenience, namely, of having some of her provinces included in other states and *vice versâ*. Should a general war break out, and the most fatal to Prussia would be one consequent upon a revolution in France, Prussia would present the strange spectacle of a young state suddenly risen by conquest, and enervated by the same cause in a still shorter space of time. As it is now, her scattered possessions may be only considered as so many bivouac stations on her way for the conquest of the whole of Germany, which it is doubtful if she can accomplish by following her present policy.

In the next general war, which no doubt will also be a religious one, Prussia will have another great evil to contend with, namely, her Roman Catholic subjects, who are as two to five in the ranks of her army, upon whom she not only could place no dependence for active service, but who would perhaps turn against her. But we are mistaken as to the probability of a future religious war; it has already broken out, and to support our opinion we have a more recent authority than the Abbé Lacordaire. A Swiss paper, the Gazette of Fribourg of February last, contains on this subject a curious correspondence which we take this opportunity to reprint.

“From the Rhine, 15th of February.

“As somewhat earlier there has been a young Germany, a young Italy, &c. so now there is arising a young Jesuitdom, which, from its cradle in Belgium, has spread itself especially over the Rhenish provinces, and which presents itself here and there with such daring confidence that one must conclude that it has some powerful secret support. We must here call attention to a fact but little known. By Ganganelli's bull, the order of the Jesuits cannot be abolished, as they are in possession of an ancient papal breve, in virtue of which any abolition of the order caused by a pope under compulsion of circumstances, is pre-declared null. In this fact we have the key which explains the rapid restoration of the society and their extraordinary pecuniary means. At the present time also the number of secular and for the most part unmarried affiliated members, is much greater than that of the regulars of the first, second, and third classes; and these are in fact the most dangerous, because they contrive to deceive the Protestants and to secure their protection. The sender of this is in possession of facts calculated to awaken the sleepers, and to excite just suspicion of the masked brethren. And since certain steps have been ventured upon in the midst of Protestant states, and without apprehension of consequences, things must have advanced pretty far! That which is now passing in Switzerland ought to excite watchfulness. We see how the so-

ciety avails itself of the political fermentation there, in order to turn the revolutionary element, which has its ground in the constitution, to its own anti-religious purposes. May this discovery not come too late!”

We abstain from any comment upon this strange document, for which task certain gentlemen connected with the periodical press of Dublin seem to be better fitted, and cordially unite in the writer's sentiment—“may attention not be awakened too late.” There is too another deplorable event since these pages were penned, to which we wish to direct the once vigilant eye of England. We allude to the deeply regretted loss of Frederick William, the King of Prussia himself, thus favourably disposed to England, as we have described him, and to the fact that the wily Nicholas was at his death-bed, and is in at the assumption of sovereignty by the son, Frederick William IV. born Nov. 15, 1795. No objection can possibly exist to kings possessing the same kind feelings towards their connections as subjects feel, but when we well know that every sentiment in the autocrat sinks into minor importance in comparison with political aggrandizement, we doubt extremely whether even at present measures totally opposed to a Prusso-Anglian alliance are not already realized, and whether the reigning sovereign be not already the blind tool of Russia beyond recall. Strong hands will be required at the helm ere long, if this be so, and strong hands must come in soon, for the failing ministry are sinking fast into deeper and deeper minorities; and when they are in a minority of the *whole house* against the *cabinet*, then we may look for *resignation even from them*.

2. *Histoire de Charles XIV. (Jean Bernadotte) Roi de Suède et de Norvège*, par TOUCHARD LAFOSSE. Paris, 1838, 3 tom. 8vo.
3. *Bidrag till Sveriges Historia efter den 4 November, 1810.* (Contributions towards the History of Sweden since November 5, 1810.) [By Captain Lindeberg.] Stockholm, 1839, 2 vols. 12mo.

THE career of CHARLES JOHN, now King of Sweden and Norway, is one of the most

extraordinary in the whole compass of ancient or modern history. It strikes the imagination more as a legend from the middle ages, or a saga of the old northman warriors, or a *lais* of the paladin princes of chivalric song, who over-ran the world as with a fairy wand, or conquered kingdoms with naught but their good spear-point,—rather than the serious and unexaggerated description of real sober facts occurring in our own time. Ninus, it is true, warred against and took “Nineveh, that great city,” and Cyrus founded Persia, overcame Cræsus and seized Babylon “that Eastern Queen,”—but myriads of Asiatics served under their banners. Alexander, like a second Bacchus, ruled in sovereign splendour from the limits of fair Greece to the centre of the gorgeous Ind,—but his genius-sabre swept along supported by the inflamed nationality of revenging Hellas, and the all-conquering discipline and impenetrable masses of the Macedonian phalanx. Cæsar could boast of “*Germania subjugata*,” though not of our “*Insula Britannia*” bowing before the eagles of the eternal city; of victories many and of liberty subdued,—but the Roman legions guaranteed his fame. In short, Napoleon and numerous other chiefs have held worlds or provinces in chains,—but countless armies or wide-spreading insurrections, or the fierce breathing *enthusiasm* of knights in holy war, accomplished all their feats.

But that the son of a decent quiet attorney of Gascony born at the foot of the Pyrenees and nurtured in the bosom of “sunny France,” should rise from nothing to be *Maréchal de France* and *Prince de Ponte Corvo*, should almost peril the diadem of Napoleon himself, and should at last (without the voice of a single musket or the sight of a single bayonet asserting his claims) be elected by acclamation to the thousand-miles-off snowy thrones of the great Vasas and of the fair-haired Harold, and should there govern in peace during thirty summers two kingdoms which he had never seen, of whose languages he knew nothing, and in which even babbling fame had scarcely breathed his unknown name and titles—this is indeed an event so wonderful, that a slight and rapid sketch of the causes which guided him to his sceptres and of his after-fortunes cannot be without interest to every reader.

JEAN-BAPTISTE-JULES-BERNADOTTE was born at Pau in Bern, on the 26th of January, 1764.* The harshness of his mother,

who preferred her eldest son, added perhaps to his own impatient temperament, disinclined him to the law, which his father had wished him to follow and in which he might have had fair prospects, and drove him to that great refuge for all discontented spirits—the army. On the 3d of September, 1780, he entered, as volunteer, the regiment *Royal-la-Marine*, which, under its colonel the Marquis de Lonse, was then quartered in his birth-place. After having passed two years of garrison life in Corsica, eighteen months of furlough at home in consequence of ill-health, and a similar period of *hanging-on* in service, he at last decided, in 1785, to devote himself seriously and entirely to the field of arms. It is during this interval (from 1780 to 1785) that most writers of his life have ignorantly attributed to him a campaign in America under Lafayette, and (like the first article in our list, and Crichton† among ourselves) long employment in the *East Indies* also. As the origin of this latter rumour has hitherto remained unexplained, and as it affords a striking characteristic of our hero's disposition, we will here insert it. In 1804 Bernadotte was Marshal of France and Governor of Hanover:—

“Among the Hanoverian officers received by the Marshal-Governor, he particularly distinguished General Von Gonheim, an amiable old man universally esteemed. He had formerly served in India in an English company, and like all old veterans took great pleasure in recounting ‘how battles then were fought,’ particularly those in which he himself had taken part. One day at the governor's table the conversation turned upon the siege of Kuladore in 1783, and the unfortunate sortie attempted by the commandant, M. de Bussey, at the head of a reinforcement brought him by the squadron of Suffren. Suddenly, the brave old soldier grew animated in speaking of a young serjeant of *Royal-la-Marine* who was wounded and among the prisoners that had fallen into the hands of the English. ‘I was then colonel,’ continued Von Gonheim, ‘and this *militaire*, who was brought to me, attracted my attention as much by his conduct as by the manner in which he expressed himself. I caused him to be transported to my tent, my surgeon lavished the same care upon him as he would have done upon myself, and in short this young Frenchman merited my affection so well that I kept him with me long after his recovery, and until he was exchanged. Since then’—added the aged general affected—‘I have been unable to hear any news of him.’—‘I will give you some,’ cried out Bernadotte with eagerness; ‘this serjeant wounded under the walls of Kuladore, this prisoner whose life you saved is—the marshal who speaks to you at this moment. He esteems himself happy in publicly acknowledging what he owes you, and will let no opportunity escape of proving to General Von Gonheim his gratitude.’

* He was, like Keppler, and many other distinguished men, a weak and sickly seven-months' child; his mother had been alarmed during the wild freaks of the Carnival.—*Lafosse*, t. i. p. 31.

† Scandinavia, by Wheaton and Crichton, v. 2. p. 269. This elegant work is weakest after 1812. As regards Sweden, details as well as engravings would have been much improved by a residence in Stockholm.

"The scene which followed may be easily imagined. The embraces, the tears, the expansive declarations of the good Hanoverian were the natural consequence of so singular a recognition. The officers of Bernadotte, who knew that he had never served in India at all,—kept countenance and said nothing.

"When Von Gonheim had retired, the aides-de-camp of the marshal hastened gaily to ask him what could be his object for so far taking upon himself the debts of the serjeant of 1783 as to become his substitute. 'Did you not see,' replied Bernadotte, 'how happy this excellent old officer was in recalling to his recollection the obligations rendered to a soldier of the regiment in which I passed my first years of service? I wished to continue his happiness. What does it matter that an error continued it to him? I have restored to our honest Hanoverian one of the most fortunate events of his life. Who knows? Perhaps Von Gonheim accused of ingratitude the favoured prisoner of the *Royal-la-Marine*! It was a good recollection of *esprit de corps* to justify my old comrade.'

"In reading this episode in the life of the Bernese general, we shall discover perhaps a trait of his country. But reflection will teach us to recognize more particularly the overflowing of a good heart, and that bounding of a generous soul which could not brook the idea of a debt of gratitude not yet paid."*

Such undoubtedly may be the opinion of a panegyricizing Frenchman, but we doubt not that every English reader will agree with us in denouncing it as an unworthy and heartless trick—as *gasconading* of the worst description.

The Revolution opened to Bernadotte, as to so many other low-born *braves* of France, free scope for advancement to the highest ranks. His fearless and opportune bravery, in saving the life of his colonel, M. D'Ambert, during an *émeute* at Marseilles, gained him well-earned advantages and a flattering compliment from M. Barbaroux, the procureur of the commune, "who was not, however, destined to see the fulfilment of his prophecy concerning Bernadotte; an illustrious child of the revolutionary Saturn, he was to be ere this devoured by him."† At a later period he was, much to his dissatisfaction, transferred to a lieutenancy in another regiment, and refused the permission he had asked to serve in the West Indies. "Bernadotte hastened, therefore, though sorrowfully enough, to join the regiment of Anjou in Bretagne; for the decree was positive he must either obey or retire. But in this new corps he managed to gain the respect of his comrades and the esteem of his chiefs more rapidly than he had expected. When the regiment *Royal-la-Marine* returned to France, the adjutant of 1790 was already colonel, whereas he would have

been a captain at the most if he had accompanied it to the colonies."*

In 1793, our republican soldier of fortune, now high in command under Kléber, performed good service in the army of the Rhine, and again developed great energy and presence of mind by suppressing a dangerous mutiny of the troops besieging Landrecies, after the murder of General Gogue. "More than once since then, this officer will show, on similar occasions, the fortunate ascendancy which military eloquence may have when properly applied."‡ This is true: not even his enemies, and their name is Legion, have ever attempted to deny it. Personally brave, calm, calculating and brilliantly impetuous (though sometimes imprudently so), educated in a school of excitement and revolution fitted to develop all his distinguished qualities, and lured on by partaking in the honours and the spoils showered upon the conquerors and plunderers of almost all Europe, Bernadotte gave early indications of a superiority which his after-life has fully verified. But we cannot help observing here, with an author rather his eulogist than his critic:—"In all the remarkable circumstances of his life, Bernadotte had the advantage of increasing the effect of his *actions d'éclat* by some solemn measure taken either by the officers of the army or by bodies regularly constituted. If it is to the devotion of some intimate friends that we must attribute this, we must confess that he had the art of meriting *warm* attachments; if it is to his personal *savoir-faire*, we must conclude that he well understood how necessary it is, in order to reap the fruit of one's *better actions*, not only to do them, but also to labour once more to prevent their being forgotten or misunderstood. He undoubtedly found himself in an excellent school for adopting such a maxim as this, and for the rest, we know that he was born *dans la terre classique*."‡

Shortly after the day of Landrecies, he rallied a corps in disorder, by tearing off his epaulettes, throwing them into the midst of the retreating group, and exclaiming, "I am no longer your chief, since you will permit yourselves to be dishonoured,"—and, having again displayed his talents on the field of Fleurus, was created General by Kléber, who wrote in his brevet, "*Promu à ce grade pour traits de bravoure et actions d'éclat*."

His exploit in taking the fortress of Wich gained Bernadotte his stars of *Général de*

division, and in the campaign of the year III. he seconded Kléber in the German war. Several successes gained him great distinction, but none more so than the *coup de main* of Bendorf, which is so prettily described by our French biographer (himself a military man) that we extract it entire :—

“The great art of the strategist is to calculate whether the importance, and above all whether the probability, of the results which he proposes to acquire can compensate sufficiently the sacrifices which they will cost him. Valour and audacity are only warlike virtues, in so far as they are of service to useful projects. We must declare then, with all that sincerity which ought to be the first law of the historian, that Bernadotte, in the brilliant *fait d'armes* which we shall now relate, sacrificed too much blood to the chances of a success far too uncertain. The facts themselves will justify this assertion.

“Our intrepid general had glanced at the possibility of carrying off an Austrian corps in the plain of Neuwied. He had just been informed that he had boats sufficient to transport at once to the right bank eight hundred men, thirty-six horses, and two pieces of artillery; and that by this means, the half of his division would be thrown upon the other side of the river in less than two hours. A more exact examination proved that all the boats they could dispose of would scarcely hold three hundred men, and that even those had no oars. ‘*N’importe!*’ cried Bernadotte, carried away by his favourite project, ‘even though I should not carry more than one company to the other side, I will attack the enemy’s camp notwithstanding!’

“It was in the month of *Messidor* [19th of June to 19th of July]; in this season the dawn is early. Bernadotte could not commence his bold embarkation at two o’clock in the morning without being perceived by the enemy, who immediately began firing from their redoubts on the expeditionary detachment. Ten thousand Austrians are there: to pass the Rhine in their presence is a design which astonishes the chiefs and the French soldiers. Notwithstanding, five out of the ten companies of grenadiers assembled by the general, embark under a deluge of fire; the chief of this first detachment has orders to seize a redoubt which particularly incommodes the passage. . . . The redoubt is carried, and with their feet in the blood of two hundred men whom they have butchered, our grenadiers turn the cannons of this advanced work against the Austrians who hasten to defend it.

“During this first action, the five other companies pass the river; Bernadotte puts himself at the head of these brave men, and they march directly on the village of Bendorf, occupied by the Austrian lieutenant general Finck. Our grenadiers make their way into this village by main force; the guard of the general quarters is taken; the equipments, registers, plans and maps are seized; and Finck himself escapes with great difficulty.

“But the ten thousand men who compose the Austrian corps, soon recover from the stupor into which they had been thrown by an attack so unexpected. Bernadotte is quickly obliged to defend himself in the position of Bendorf, attacked by four battalions. . . . It then became difficult to disguise from our grenadiers the peril of their situation; many threw down their arms; others are about to imitate them: discouragement is the most contagious of all diseases. At this sight, Bernadotte, *rugissant comme un lion*, and seeing captivity inevitable unless he succeeded in exciting the courage of

despair against this frightful extremity, points out to his soldiers several of their comrades whom the enemy massacred although disarmed, and cries out with a thundering voice: ‘You see that you cannot escape death by throwing down your arms; snatch them up once more, and know how to die bravely, defending your lives and your general!’

“At this moment a third transport of troops arrives; Bernadotte can only oppose about eight hundred men to ten thousand Austrians. His grenadiers fight like the Spartans at Thermopylæ, and, more fortunate than those heroes of antiquity, they triumph. . . . In vain do the generals Finck, Kilmayer and Witgenstein unite their efforts to recover the redoubts and the general quarters; after four hours of an Homeric combat, the republicans force their enemies to retreat, and remain masters of the shore. The trophies of a feat of arms almost incredible are, four hundred prisoners, two thousand sacks of oats, thirty waggons loaded with bread, and a hundred and fifty baggage-horses.

“Success justifies every enterprize; but it ought not to authorize their example, when it was obtained beyond the limits of prudence. ‘Impossibilities,’ as Napoleon said at a later period, ‘are rare conquests.’”

The army of the *Sambre-and-Meuse* continued to advance, and gained Bernadotte an order from the Directory to lead 20,000 men into Italy. During his march he again distinguished himself for the discipline of his troops, and is not inaptly complimented by *Lafosse*, as being “the Jupiter Stator of mutinies.” At last he met that mighty genie whom God had commissioned him, when the time should come, to paralyze and destroy. And here we quote once more :—

“Before we follow the divisions of Bernadotte across the Piave, we must detail some particulars of this general’s first interview with Buonaparte. There was something solemn in the meeting of these two distinguished men, for, as we shall very soon see, they mutually penetrated each other’s character at this their first rencontre. Buonaparte was exceedingly free in conversing with his new lieutenant; Bernadotte was less so; perhaps his reserve arose from his having already divined the secret of the young captain. That he had done so, we may judge from his observation, on returning to head-quarters, to the officers who asked him concerning Buonaparte :—‘I have seen a man twenty-six or twenty-seven years old, who wishes to be thought fifty, and this does not augur well for the republic’

“Buonaparte, on his side, did not characterize Bernadotte with less justice and originality. ‘He has,’ said he, ‘a French head and a Roman heart.’”†

If to this we add the remark of the same great Corsican at another period—“*Il a du sang maure dans les veines*”—we shall obtain a psychological description on which it would be difficult to improve.

In Italy, the Arch-Duke Charles again found more than his match in the commander of Napoleon’s van-guard, who, at the battle of Gradiska, again harangued his

* *Lafosse*, t. i. p. 89.

† *Lafosse*, tom. i. p. 124.

troops in that style of laconic eloquence so common among the heroes of the Revolution:—"My friends," he exclaimed, "do not forget that you belong to the army of the *Sambre-and-Meuse*, and that the army of Italy beholds you!" The troops replied by gaining him the battle, and afterwards added to it several other victories, particularly the capture of the Idrian mines, where five millions (of francs) worth of ore became the spoil of the army. Shortly after, the chief of the *avant-garde* performed an action worthy of all praise, by causing some salt-magazines seized by the troops to be sold, and the proceeds, 200,000 livres, to be given to the inhabitants of two villages, which had been razed to the ground by his engineers in order to assure the defence of Palma Nuova. He was shortly after left by Napoleon governor of Friuli, in which post he behaved with great prudence and moderation. Everywhere he procured himself admirers and supporters; indeed the suavity and attractiveness of his manners, and the scarcely-to-be-resisted charm of his conversation, gave him a power dreaded by Napoleon himself. It might be said of these two generals, in the words of the old Italian proverb respecting the Prince of Condé and the great Coligni,—“God save us from the Condé’s tongue and from the Coligni’s tooth-pick!” To all this must be added his profound and accomplished craft, and his instinctive knowledge how and when to employ the weapon—whether of gold (though not without a pang!) or of steel—most fitted to accomplish whatever object he may have had in view.

But we may as well here, once for all, enter our protest against the sweeping applause sometimes bestowed upon this commander, as though he had been in his campaigns a paragon of civic virtue, a warrior altogether uninfluenced by the principles displayed by the captains and Directory of France in the first heat of the national explosion. Such was by no means the case. *Audi alteram partem*. The disagreeable details, however, of this period of his career, have been so carefully suppressed by all his modern biographers that we might be tempted to suppose the picture had no shades. In order to give a little relief to such bright colours, we cannot help quoting passages from two summonses of Bernadotte preserved in an old and awkward English compilation long since forgotten except by the military student. The first was to the governor of Gradiska, and commenced thus—

“Sir,—You have defended yourself like a brave man, and, by doing so, have acquired the esteem of

military men; but a longer resistance on your part would be a crime, which I would revenge principally on you; and to justify myself in the eye of posterity, I must summon you to surrender in ten minutes: if you refuse, I shall put your garrison to the sword.”*

This demand was successful, and the garrison were made prisoners of war.

The second, in 1797, after his ambassador-exploit at Vienna, was to the Rhingrave of Salm, governor of Philipsburg, and concluded in these terms:—

“Should you oblige me to give orders for the assault, I am sure I cannot but succeed, as the number of troops I have with me, and the other means I possess, render it impossible I should fail. But the punishment of those who have been the cause of resistance to the French Republic, shall be terrible; *nor will I restrain the rage of the soldiers, who will give way to their fury against you.*”†

Notwithstanding the impossible in the Rhingrave’s defence, (whose answer was as calm and manly as the summons was insolent,) Bernadotte was compelled to turn the siege into a blockade, and at last to raise it altogether.

In 1797 our hero had another interview with Buonaparte at Passeriano, and to the views he there developed may probably be attributed the peace of Campo Formio, which the great captain soon after concluded. But fire and water are seldom long at peace. A new meeting was followed by new intrigues, and the ambitious master of the Directory, jealous of his rival’s power as well as glory, caused the appointment to the army of Italy, which they had conferred upon him, to slip through his fingers. This event was followed by Bernadotte’s indignant quasi-resignation, a “consummation” cleverly evaded by the celebrated embassy to Vienna. The affair of the tri-coloured flag, and the revenge taken by the populace on the insult,

* *Philippart’s Memoirs and Campaigns of Charles John, Prince Royal of Sweden.* London, 1814, p. 28.

† *Ibid.* p. 51. Mr. Philippart adds, “I cannot avoid drawing a comparison between this summons and the conduct of General Moreau, in 1794. When General Moreau summoned the town of Sluys to surrender, its governor, Vanderduyn, replied, ‘The honour of defending a place like Sluys, that of commanding a brave garrison, and the confidence reposed in me, are my only answer.’ It was early in the month of July that General Moreau first sat down before Sluys, and the brave garrison, determined on resisting the rapid advances the French had made in their occupation of the Flemish Austrian provinces and towns, continued to make a most vigorous defence until the 25th of August, when it surrendered. The soldier-like resistance which they displayed induced General Moreau, with Roman greatness of mind and true glory, to grant advantageous conditions to the garrison, and he strongly expressed his pride and satisfaction in having been opposed to soldiers of such determined gallantry.”

are so well known that we need not dwell upon them here.

On his return from Vienna, in the month of August, 1798, Bernadotte, who had refused the post offered him by the Directory, married the present Queen of Sweden, Désirée Clary,* the daughter of a rich French merchant established at Genoa, whose sister was united to Joseph Buonaparte, and who had even once been wooed by the future Emperor himself. Shortly afterwards he was appointed to the command of an army of observation on the Rhine, and was offered the appointment in chief of the army of Italy, but, as he regarded the number of its troops to be insufficient, he declined this post.

We have now arrived at one of the most important events in the life of Bernadotte,—his assumption in 1799 of the portfolio of the minister of war. The machinery which procured him this high office was Buonapartean; Joseph and Lucien Buonaparte judged him a fit person to serve the army, at the same time probably considering him as one willing to serve their brother and himself. In the latter opinion, however, they were mistaken; his career was too parallel to become at once subordinate, and consequently the same power which had lifted him so high, threw him back again into the common military circles. It is well known how remarkably his talents and enthusiasm succeeded in restoring order and a certain degree of plenty to the scandalously chaotic and bankrupt departments of the French defence. Two short months sufficed for him to procure and transmit supplies of all kinds to the various armies of his country. His great weapon was, appealing to the passions and glory of the people. As a specimen of his language, we add extracts from two proclamations of the period, which are rare in French, and have never yet, we believe, been published in an English dress:—

“The soldier of the monarchy was the blind instrument of a capricious will; all his labours had but one great end—to establish the more firmly a tyrant upon his throne.”†

“The soldier of liberty took up arms, only to defend his rights; it is the knowledge of this which is in him the motive to great actions, and liberty is their lever. To this creative movement we owe all the illustrious men who are at this moment the glory of the republic. . . . Some of you are called to overthrow thrones, some of you to preserve liberty in your own country. I have now laid bare the secret

of your strength, and you now see with what eyes you should regard the Austrians and the Russians.”* “Freemen! Let us unite! Republicans! be vigorous but wise, and only see your enemies in royalism. The day when we discover the power of union,—the coalition of kings is no more!”†

While upon the head of proclamations, we cannot help adding a sentence from that to the division in Switzerland, which had just lost their commander, the brave and brilliant Schubert:

“While we had kings it was often said, that after the production of a great man, Nature needs repose. But in your ranks I behold many a Schubert and many a Buonaparte; for in our days Nature herself is changed by liberty.”

Napoleon never forgot this magnificent pique. Indeed it was afterwards repeated by Bernadotte, when he took leave of the troops he had commanded in La Vendée in the year X. :—

“Peace will restore you to a life more sweet; enjoy in repose the remembrance of your triumphs, and never lose sight of the fact, *que l’élan de la liberté vous a conduits*. You may preserve your glory, but with difficulty will you ever be able to increase it. Each of you may with pride raise his soul to ideas the most noble; almost all the generals who have led you to victory *sont sortis de vos rangs*.”‡

After the events of the 18th Brumaire, when the race was literally “neck and neck” between the two great rival generals, but when Napoleon again showed how alone he stood in real depth and grandeur of soul among the giants—pigmies to him—whom the revolution had assembled around him, our republican accepted fresh honours at the hands of—the First Consul. These, however, he forfeited, through his connection with the conspiracy of Marbot. Other causes contributed to extend the breach, till Napoleon seized a favourable opportunity of neutralizing altogether the influence of his dangerous subject, and offered him the governorship of Louisiana. A variety of delays prevented Bernadotte from hastening to his post, and in the meantime the cession of the pro-

* *Proclamation aux Conscripts.*

† *Proclamation aux Administrateurs.*

‡ We may as well take this opportunity of remarking that a complete collection of the speeches and proclamations, &c., of Charles John, from his first stepping on shore in Sweden on the 10th of October, 1810, to January 28th, 1825, may be read in a very elegant English translation by Mr. Meredith, appended to his “*Memorials of Charles John*,” 8vo. London, 1829.

* The fruit of this union was Oscar, now Crown-Prince of Sweden and Norway, who was born July 4, 1799. His rather remarkable name was given him after the hero in Ossian’s poems (which Buonaparte had just then brought into fashion) by the First Consul himself, who even honoured his father so much as to be inscribed godfather at the baptism.

† *Proclamation aux Conscripts.*

There have been two editions, both published in Stockholm, of the originals in French. The last goes down to November 8th, 1837. But, for reasons which our readers will well understand, those prior to his arrival in Sweden have never been collected, and must be hunted for in all sorts of publications on the wars of the revolution, &c.

vince and the war with England put a stop to the whole plan. Lafosse here treats us with an amusing episode of the prophecies of a "*pythonisse*," anglicè, fortune-teller, who predicted an empire to the consul and a kingdom to his lieutenant. As the story, however, is somewhat of the longest, and probably apocryphal (at least in its present shape), we cannot here insert it.

"A reconciliation afterwards took place between the general and Buonaparte, and, on the nomination of the latter Emperor of France, General Bernadotte was one of the first who signed the document. He is also reported to have made the following address to Buonaparte on this occasion:

"I thought for a long time, Sire, that France would not be happy under any but a republican form of government. To the hearty persuasion of the excellence of this paradox, your majesty may attribute the conduct I have pursued for more than three years. Enlightened by happy experience, I feel much satisfaction in assuring you that my illusions are entirely dissipated. I beg you to be persuaded of my eagerness to execute any measures that your majesty may prescribe for the good of the country. I moreover declare to you, as well as to all my friends here present, that I share the sentiments which General Murat has just delivered to you in the name of the army, not politically and by word of mouth, but with heart and soul."

"Buonaparte rewarded General Bernadotte for his support by appointing him one of the marshals of France, and gave him a command at Hanover."*

In 1805 the marshal, who had displayed great moderation in his government of Hanover, marched to partake in the German campaign, and served with distinction in the battle of Austerlitz. This, in addition to his other qualities *vis-à-vis* the Emperor, gained him in 1806 the principedom of Ponte-Corvo, in Italy. Lafosse has some very pertinent reflections on this system of rewarding "*une valeur toujours éclatante, mais entachée de servilisme*," with "a perspective of titles, dotations, principalities, and even thrones."† When he afterwards was about to leave France and assume his Swedish sceptre, he sold his principality to the Emperor for the sum of 2,000,000 of francs.

The campaigns of 1806 and 1807 raised still higher the military renown of the Prince of Ponte-Corvo. Though it was not always the "*Veni, vidi, vici*" of his later biographers, he still gained many important victories. One was at Saalfeld. At Halle he defeated the Prussian reserve under Eugene Prince of Wurtemberg, with a very inferior force. In the bulletin of the battle of Jena, gained by Napoleon just before, the Emperor had pompously announced that he was in full march with an army of upwards of

60,000 men to engage and destroy *this very corps of reserve* shortly after annihilated by Bernadotte at the head of 15,000. The courier could not be overtaken, and Buonaparte could never forget or forgive the bitter lesson given to his arrogant vanity by this unseasonable victory. He was also triumphant at Lubeck (which was plundered) and at Radkan, where Blucher himself capitulated to his forces united with those of Murat and Soult. The battle of Mohringen, which the Norwegian memoir-writer calls "*en glimrende Træfning*" (a brilliant engagement), was at the very least a *drawn game*. Indeed one circumstance in this "affair" could not but have been disagreeable to the marshal personally:—

"During the action, Prince Michael Dolgowick, with his regiment of dragoons, went round to the rear of the French, made his way to head-quarters without being perceived, and carried off Marshal Bernadotte's equipage, his plate, and some ladies."*

At the attack by the allies on the *tête du pont* of Spanden on the Passarge, the marshal received a wound which, though slight, obliged him to quit the army for the remainder of the campaign, an event of the less importance, as the victory of Friedland put an end to the war.

After the treaty of Tilsit, in 1807, Bernadotte was entrusted with the command in chief of the Hanse Towns, and resided for the most part in Hamburgh. While in this city he behaved very generously to a poor old French *émigré*, who had inserted in a German Grammar, as an example in the syntax, "*On dit que Buonaparte est un grand général; mais ce n'est qu'un brigand heureux*." On the incorporation of the Hanse Towns with France, he had fallen out of the frying-pan into the fire by changing Buonaparte to Bernadotte, just as the latter happened to receive the command in chief of his asylum. The white-haired old professor, however, escaped with a fright and a present. Lafosse adds another amusing story, which he calls "*atticisme à la Henri IV.*," about the witty method employed by the marshal to obtain some improvement in his lodgings, but the length of this article will not permit its insertion.

It was shortly after this, that 6000 of the Spanish auxiliaries, under the Marquis de Romana, who had been marched to Denmark and placed under the marshal's own command, made their escape to Spain, an event for which Buonaparte accused the marshal of great negligence. He nevertheless employed his military talents in the

* *Philippart*, p. 67.

† *Philippart*, tom. i. p. 314.

* *Philippart*, tom. i. p. 118.

campaign of 1809, where he partook in the victory at Wagram, although not without being again severely censured by Napoleon for being tardy in his movements, and for his columns having displayed great confusion, even firing upon each other by mistake, which occasioned much slaughter.

The next and last military employ entrusted to the French marshal, was the command of the army at Antwerp, after the landing of the British at Walcheren. The Prince was now living in Paris in full disgrace with Napoleon, but as the need was pressing and his military talents were universally acknowledged, the royal council conferred upon him a command full of difficulty, but which he filled with honour and complete success. In consequence, however, of a proclamation in which he took great merit to himself and hinted at great faults in the dispositions of Napoleon, he was recalled, returned to Paris, ordered to confine himself to his principedom, spiritedly refused, and hastened instead to Vienna, where he reconciled himself to Napoleon, who conferred on him the governorship of Rome—but subsequent events prevented his entry upon its functions.

It is here that we are introduced to the second or Scandinavian half of the life of Bernadotte. The honest and economical, but obstinate and narrow-minded Gustavus IV. had, fortunately for Sweden, just been deposed. The constitution of 1809, the work of some chiefs rather than of the nation, and which did so much at the same time that it left so much undone, had been hastily adopted, and the vacant throne filled by the late King's uncle, now Charles XIII. The Swedish people hastened to give their childless monarch a presumptive successor, and their choice fell upon Charles August of Augustenbourg, with whom they had become acquainted during his command of the troops in Norway. The talents, but still more the virtues, of this noble youth, his simplicity of manners, his affability, and his almost Spartan parsimony—a duty still more admirable and necessary as Sweden was then almost exhausted by the war—attached to him the hearts of all his people, and would probably have ended, as was the plan of the revolutionary chiefs, in attaching Norway to Sweden in voluntary union for ever. But

to raise the subject of our memoir from the *tabouret* of the Buonapartean feudatory to the throne of the great Gustavus, and as the real history of these transactions is wilfully or from ignorance suppressed in the various memoirs of Bernadotte, and is consequently unknown except to a few among the initiated of our countrymen, we shall go more into detail on the subject.

The aspirants to the vacant dignity were three:—1. *The King of Denmark*, supported by the wisest among the Swedes, who knew the vital importance of such a union among the three Scandinavian nations as would not only compensate Sweden for the loss of Finland, but guarantee the future existence of the three states amidst the threatening revolutions of continental Europe and against the despot Czar. But unfortunately, the prejudices of a large party, added to the jealousies of many of the chiefs, who justly feared that such an event would deprive them of all their factitious consequence, succeeded in influencing Charles XIII. to oppose and deprecate the election of his brother sovereign.—2. *The Prince of Augustenbourg*, brother of the late Charles August, and brother-in-law of the King of Denmark. This candidate was patronized by King Charles himself, and by the men of 1809, as the revolutionary chiefs called themselves. His character, however, was that of a scholar rather than of a soldier, and his political position offered no advantages to Sweden in case of his election.—3. *George Duke of Oldenburg*, brother-in-law of Alexander, and a relative of the Queen of Sweden, who supported his claims. His principal adherents were General Adlercreutz and his partisans, whose interest was gained rather through the influence of the Queen and their jealousy of Adlersparre (who was strongly in favour of the second candidate) than by any particular views of superior advantage to the country. The late dynasty had, singularly enough, no supporters. Not one noble held up his hand to confer the crown forfeited by the father on his unoffending son! But this resulted from the well-known dishonest birth of the late king himself, and from his having too grossly insulted the patrician pride of the higher orders, especially the military chiefs, most of whom were nobles.

Napoleon, the principal great power interested in the question, affected to keep his inclinations secret. He had already decided on the gigantic efforts afterwards made against the always false, the always fickle, the always selfish Russia; but the moment of explosion was not yet come. As yet, he needed Alexander's friendship. But the

“*Heu miserande puer!*”

or rather—*Heu miserande popule*—he was to be the Marcellus of the north, and died suddenly in Scania on the 10th of May, 1810.

This melancholy event rendered imperative a second election, and as its result was

formation of a consistent northern monarchy, under the protection of the eagles of France, would, he imagined, close the Baltic against all the attempts of British convoys, lock the gates of that sea against Russia herself if necessary, and assist in the subjugation of that insolent power by co-operating in the invasion of her western provinces. Consequently, although the ambassador at Stockholm was instructed to act with great caution, the demi-official gazettes of Paris were allowed to give hints which Europe could well understand. "*Sans doute*," said the *Journal de l'Empire* for the 9th of June, "*on va proposer un prince de la maison d'Oldenbourg souverain d'un état voisin*."

While affairs were in this state of uncertainty, the Swedish diet was convened at Örebro, instead of Stockholm, which it was feared was too agitated after the late murder of the Count Fersen, who had been suspected by the populace of being the poisoner of the favourite Crown Prince, Charles August. At the same time the King dispatched two couriers to Paris, bearing copies of his letter of the 2d of June, 1810, to the Emperor, in which he begged the assistance and protection of that great chief in favour of the election of the Prince of Augustenbourg.

The one of these two couriers was a young lieutenant in the infantry, a certain Baron *Mörner*, an individual of no consequence, wealth or birth.—To this "*jeune homme étourdi et enthousiaste*," as the Baron Wrede shortly afterwards denominated him, this baron-ling almost as unknown in Stockholm as he was in Paris, Bernadotte was indebted for his election to the throne of Sweden. So inscrutable are the ways of Providence! So are the wisdom, the strength of this world mocked by the ignorance of the foolish!

On arriving in Paris the young baron was informed on all sides of the approaching election of the King of Denmark as successor to Charles XIII. These news alarmed him. Visions of the Calmar union, Christian the tyrant, Danish bailiffs and foreign tax-gatherers, in short all the bugbears of a school-boy's reading, immediately crossed his imagination. Besides, like the army in general, he burned for the humiliation of perfidious Russia, the recovery of Finland, and the restored lustre of Swedish arms. This, he knew, could not be accomplished by the unwarlike Frederick VI. He therefore turned his thoughts to the generals of Napoleon, and, by the advice of M. Signent, a man of talent and liberal principles, who was then Swedish consul at Paris, fixed his choice upon—Bernadotte.

Having procured through M. Signent an interview with the Prince, he explained to him his views, assured him of the support he would receive from the officers of the army, and prayed him to lose no time in preparing for his success by enrolling his name among the candidates. The Prince was not inattentive to these *démarches*, but explained himself more fully some days later, on being visited by Baron Wrede, who was then visiting in Paris in the capacity of an extraordinary diplomatic agent:—

"As to my religion, which you make a motive for my exclusion, I belong, by my family, and especially through my mother, to that professed among yourselves, although I have hitherto followed the religious principles of my father. For the rest, I was born in the country of Henry IV.; what he did not hesitate to execute, I myself am capable of doing.* The study of your language offers difficulties, it is true; but surrounded by Swedes, I hope that I shall soon be able to master it.† And lastly, as to my standing with the Emperor, I am convinced that what you have told me is entirely without foundation."‡

This last expression, which apparently assured him of the support of Napoleon—a view confirmed by the diplomatic caution exhibited by the Duc de Cadore, the French minister of foreign affairs—assisted in giving some kind of substance to the imaginary propositions made by Mörner. The latter having first arranged with the Prince of Ponte Corvo, that an emissary should follow him, so as to reach Sweden after the opening of the diet, dexterously eluded both the Swedish mission and the French police, and arrived in Stockholm without accident. When there, all the individuals most intimately connected with the foreign department were highly indignant at his unauthorized and extravagant conduct. "Young man," cried out the Count Essen, marshal of the army and of the kingdom, "you de-

* At another period Bernadotte happily varied this expression, by saying—"If Henry IV. could change his faith to obtain the mass, surely I can do the same to get rid of it!"

† *Crichton* (Scandinavia, vol. ii. p. 268) gives us the remarkable intelligence that Bernadotte, almost immediately after this wish, found it so miraculously fulfilled, that, after landing at Helsinborg, on the 20th of October, 1810, he "gratified the crowds that awaited his approach" on his journey to Stockholm, by "addressing the peasantry in their vernacular language!" If this language was any other than "the unknown tongue," or the original language discovered by the Eastern king, as narrated by Herodotus, we may safely assert, that neither the prince nor the peasants had much edification from their dialogues; for even at this moment—after the lapse of thirty years—Charles John cannot even read, much less speak, the language of the country.

‡ *Dépêche* du Baron de Wrede, en date du 28 Juin, 1810.

serve to be shut up in a dark cell, and to be deprived for ever of the light of heaven!" However, intelligence of what had passed in Paris gradually spread, the officers and anti-Russian party and the movement, or French faction, began to declare in his favour; and at the opening of the diet, (thanks to the care of this lieutenant of infantry) some score of its members began to be aware of the *existence* of a certain Marshal Bernadotte!*

Fortunately for the latter, his secret agent arrived at this moment in Örebro; *one day later* and he would have been too late. He brought with him a portrait of Prince Oscar, and various verbal communications from Bernadotte; among others, the very proper and prudent one, that, in case of his election, he would only accept the title on condition of the king giving his consent. The arrival of this messenger threw all the parties into confusion. The partizans of Oldenburgh began to give way. Both the king and the people imagined that all these measures of the French marshal (of whom his master daily showed more and more jealousy and hate) must have presupposed both the consent and the wishes of the mighty Emperor. Wrede continually extolled the brilliant qualities of the new aspirant, whose mildness to the Swedes taken prisoners in Germany was continually repeated and exaggerated, and Charles XIII. was old, feeble, and irresolute.

At last, after all these intrigues—and though Mörner had been arrested, and Desaguers, the French envoy, disavowed and recalled by the Duc de Cadore for supporting the King of Denmark; a formal punishment, which could not disguise the real sentiments of Napoleon—the *men of 1809* had still a decided majority. They reckoned 109 votes; the Prince of Ponte Corvo had only 88; and 50 or 60 were still uncertain, and waited the King's own decision. A little more firmness, and his own candidate would have been triumphantly elected. *But he feared Napoleon and the movement party*; and resolved at last, though only after many a pang, to support Bernadotte. This, added to the conduct of Adlercreutz, who went over to the marshal's party (from hatred to Adlersparre, the great chief of Prince Christian's supporters) as soon as he found that Oldenburgh had no more hopes, immediately gave the immense majority in favour of the Prince of Ponte Corvo. The king, adding to those around him, "*J'enleve, par cet acte, la*

couronne de Suède à toute ma famille," proposed him to the states; and this his nomination was "carried by acclamation" in the four chambers of the realm, and the documents of vice-regal sovereignty and adoption were immediately transmitted to the fortunate republican consular imperial military adventurer—now heir to the throne of Sweden—at his residence in Paris. So ended this remarkable election.*

"Such was the splendour of France in 1810, that one of its generals was summoned to support the throne of the great Gustavus and of Charles XII., without her perceiving, in this event, either that she lost one of her greatest captains, or that she ought to glory in a choice which opened out to him a destiny so noble."† At Elsinour Bernadotte embraced the Lutheran faith, before the Archbishop of Upsala and the Bishop of Lund, and on the 5th of November, 1810, was publicly received by the king and the diet in the great National Hall (*Rikssalen*) at Stockholm. His speech on this occasion was, as usual, very judicious and very brilliant, especially in the original French, without exhibiting signs of any thing profound.

But we must again hasten with rail-road speed. The situation of Sweden at this period is sufficiently well known. If we take facts as our guide, and not the boastings so often indulged in of late years by Charles XIV. John, we shall find that the country was in great want of repose and re-organisation after such heavy losses and such a sudden revolution, and longed for a policy founded upon national faith, public liberty, and rigid parsimony, it is true—but that it still retained its honour, and all its real principles of vitality, strength, and independence. Whether these former conditions were fulfilled by the actions of the new sovereign—for the feebleness of the old king rendered him the actual ruler almost from the moment he entered the Swedish council—we shall see hereafter. Still nothing could exceed the tender and devoted care, and the exact regard for all the forms of royalty, lavished on the aged monarch by his adopted son. In this respect his honourable loyalty was unimpeachable.

In 1811 the Emperor appeared determined to compel Sweden to enter into the continental system. But we will now, at length, give a specimen of the Norwegian biographer:—

* The peasants especially were exceedingly puzzled in their deliberations. "Ponte Corvo," (which means, in Swedish, *Ponte Sausage*), "we will not have; Bernadotte is our man!"

* There is a very elegant, though rather short article, on the election of Marshal Bernadotte, in the "*Revue du dix-neuvième Siècle*," t. v. p. 733. Paris, 1838. The author is Herr Lunblad, a Swedish littérateur of great merit.

† Lafosse, tom. ii. p. 161.

"The crown-prince now felt himself at a loss from the haughty advances of Napoleon, and reduced to a complete dilemma by his extravagant demands, which were besides represented in that insolent tone so common among the French diplomatic agents of this period. These disadvantages, ignorance of the language, which forced the crown-prince to make use of the court nobility to whom French was their second nature, and, in general, the oppressive rivalry of the nobility to obtain his favour—rendered it difficult for him to be so useful for Sweden as he wished and might have been. The crown prince made the French minister keep within his limits and prayed the king and council to decide, without any reference to him, as to the various demands of Napoleon, who especially insisted that Sweden should declare war against England, close its ports against its ships and goods, and confiscate the same wherever they might be found within the kingdom. A nearer approach to Napoleon and his policy was certainly advisable, but such blind obedience was neither honourable nor advantageous, and was impossible to the extent called for by Napoleon. The king, however, agreed thereto, and the crown-prince communicated this intelligence to Napoleon in a document which gave him to understand that Sweden had made a sacrifice which must be acknowledged. But Napoleon, inflamed by his hate-breathing idea of annihilating Great Britain by shutting it out from the Continent, (the continental system,) only went still further in his exactions. Sweden was treated with the scorn befitting a conquered nation, and it resented the indignity; the crown-prince was regarded as a suspicious vassal: and it is even said, that a plan was formed to gain possession of his person and carry him back to France. Napoleon, indeed, began to dread every thing from him; he knew that Carl John might become his most terrible enemy—and he became it."*

Yes! the situation of Sweden, and the "signs of the times," and of its accomplished military ruler, demanded that Sweden should become not only the obedient limb, but the subsidied and secret-service-monied ally, of one of the two great powers which then held their mighty struggle. Buonaparte, fatally blind and blindly fated, neglected the auspicious moment—and Bernadotte turned elsewhere.

The treaty of Petersburg, dated March 24th, 1812, laid the ground-work of the future explosion. The crown-prince, of course, "made his terms." But why Norway, the territory of a friendly power, was fixed upon by the two sovereigns, at their famous interview at Abo, as the future booty of Bernadotte, instead of that precious and still bleeding "shield of Sweden," Finland, which Russia had gained more by treachery than arms, is a mystery not yet revealed. Alexander, we know, was a "generous" prince; perhaps he was so in more senses than one; at all events, history proves him to have been *at least* equally "wise" and "prudent."

In 1813, Bernadotte, at the head of 30,000

Swedish troops, was enabled, thanks to an English subsidy, to commence his celebrated campaign of liberation, commanding in chief the combined army of the north of Germany. We have no space, however, to detail the transactions of truce and war occurring in 1813 and 1814. Suffice it to say, that the victories of Gros-Beeren, Dennewitz, and Leipsic, &c. gained under the prince royal, together with the various other successful movements of the allies, drove Buonaparte back upon France, and at last led him to exile and to Elba. The conduct of the Crown-Prince of Sweden, in reference to France, was as unobjectionable as could have been expected. He opposed the invasion of the French territory from the beginning to the end of the war, denouncing its injustice no less than its impolicy in no measured terms. At last he retired altogether from the field of war, which was assuming a character inconsistent with the interests of Scandinavia, and commenced his operations against Denmark. His successes were as rapid as they were to be expected; and that power—which had neither *moral* nor *material* forces sufficient to resist him—was compelled at last gladly to rescue its capital by the surrender of the *terra vexata*—Norway. This was a heavy blow. No compensation of moment was ever afterwards obtained, and all the intrigues of the court of Copenhagen failed in averting its fulfilment. Norway, and its rich overplus revenues, will never be Danish more!

The question of Norway, its revolution, its confederation with Sweden, and its remarkable development since that period, would be an episode impossible to do justice to here. However interesting the subject, therefore, or tempting the occasion, we must shut our eyes and stop our ears, and pass onwards. Perhaps some more favourable opportunity may occur hereafter of entering upon a subject so little known in Great Britain.

Suffice it to say that Bernadotte, impelled by the pressing necessity of closing with Norway, *coûte qui coûte*, and thereby throwing the question at once out of the forum of the allies (whose tendencies and whose falseness he knew too well), and thinking, Frenchman-like, in his profound ignorance of the Norwegian character, *nous changerons tout cela*, sanctioned after a short campaign the nearly republican constitution of Eidsvold in August, 1814, and thereby assured to himself and his dynasty *one throne more*, and to Sweden, in exchange for all its expensive efforts, all its sacrifices, and all its generous confidence, *a valuable negative western frontier!*

* Wergeland, p. 47.

Having now dispatched every thing relative to the campaigns and warlike deeds of our illustrious hero, we can follow with greater calmness the stream of his civil government during a period of thirty years, without having our attention distracted by the din of arms or the sound of the hoarse-voiced trumpet.

One of the first important measures of the new government was ill-omened for the liberties of Sweden. On the 16th of July, 1812, the Diet was induced, partly during the enthusiasm of the opening campaigns, and partly from the *express assurance* of the court chancellor, Count Wetterstedt, that it was only a temporary measure, and would be almost immediately repealed—a royal promise the government has not yet thought proper to fulfil—to sanction a new law relative to the liberty of the press, whereby, among other regulations, the power of confiscating the public journals, &c. “without judge or jury,” was entrusted to an organ of the government.

The ordinance published the same year prohibiting Swedish subjects, “on pain of death, confiscation, and dishonour,” having any the most slight or necessary communication with the late royal family or their descendants, has at this diet occasioned much bitter disputing. Certain it is that during the present king’s reign the country has seen a *very great number* of accusations and punishments for high treason, &c.; many of them no less ridiculous in their origin than objectionable in their execution.

One of the greatest stains upon Bernadotte’s government is the disgraceful *liquidation* of the foreign debt of Sweden, as by a kind of Swedo-Hibernicism, a measure of national bankruptcy *quoad hoc* was denominated. The personal interference of “his majesty’s very dear son, the crown-prince,” in this transaction, whereby he procured “to himself and his heirs,” an annuity for ever of 200,000 rixdollars, banco, and the disagreeable mystery in which *the details* of the “liquidation” have always been surrounded, render the whole subject particularly unpleasant to every admirer of the famed honour and good faith of the Swedish people.

We may also as well mention here, in connection with the above, the extraordinary transactions connected with the sale of Guadeloupe and of Pomerania, &c. Charles John, by a most unheard-of interpretation of the treaty of London, the 3d of March, 1813, assumed the transfer of the island of Guadeloupe, as being to himself personally and his heirs. Consequently, when he arranged the repurchase thereof by France, on the restoration, he quietly put the proceeds, 24,000,-

000 of francs, into his pocket, *generously* giving back the half of this sum towards the (alleged) payment of the foreign debt. But not content with this, Pomerania and Rügen also, though conquered by the gold and blood of Sweden two centuries (and not two years) before, was in the same manner—without the diet being called upon for their consent, and also by some sort of mental doctrine of the national provinces being the *private property* of their illustrious ruler—disposed of to Prussia, for the sum of 3,500,000 riksdaler courant. This was in June 7, 1815. Two millions of this sum were, *out of grace and favour*, and with another flourish of trumpets, applied to the service of the state. We really cannot understand what principles can have governed the representatives of those times to tolerate such illegal scandals. The enthusiasm, however, in favour of their new revolutionary chief, and the late union with Norway, the *actual* amount of whose benefits for Sweden were as yet scarcely dreamed of by the people, surrounded the administration and its head with a kind of *gloria*, a halo-brightness, which later years have only slowly, though too surely, dispelled.

The “rouble fund” is another transaction in the same taste. A million and a half of riksdaler banco were the *douceur* appropriated to himself by the chief of a state, whose tax-paid forces constituted his power. These transactions, by which nearly 2,000,000*l.* sterling have been appropriated to the royal house of Sweden, together with a clear annuity of 4,000,000*l.*, prove how very far *north* Bernadotte is, and that southern sovereigns are vastly his inferiors in the art of extracting money from their people, since the civil list is quite distinct from these “*petites affaires*.” If we consider the poverty of Sweden in relation to other countries, Bernadotte is unquestionably the most richly endowed sovereign in Europe.

The only remaining colony of Sweden, the island of St. Bartholomew, would have shared the fate of its predecessors. But

“When the government in 1818 drew up a plan for selling Bartholomew also, the states-general were this time consulted upon the project, and although they sanctioned the scheme, made it a condition that the proceeds should be disposed of to the state’s advantage. Whether it was this proviso, or whether it was a want of purchasers, we do not know; but in one word, no bargain has yet been made, and Bartholomew is consequently to this day a possession of the Swedish people.”*

In 1812, the government procured the adoption of a plan for excepting this island

* *Lindeberg*, tom. i. p. 185.

from the control of the common authorities, &c., and placing it under the immediate jurisdiction of his majesty! From this period many abuses date themselves! lately, especially, complaints have been made of the local authorities having favoured piracy in the seas around it.

On the 5th of February, 1818, the old king, Charles XIII., a weak but ambitious man, who had twice been called to direct the vessel of the state, died quietly in his bed, followed by the regrets of his people. The crown-prince immediately succeeded him, under the name and title of Charles XIV John King of Sweden and Norway. His coronation in Sweden took place on the 11th of May, at Stockholm, and in Norway on the 7th of September, at Christiana. The people every where expressed their delight and enthusiasm. A feeling of hope and confidence in the future, from the character and abilities of the new sovereign, filled every breast, and inspired the most lively popularity. It was indeed an occasion full of important lessons, this elevation of the low-born republican of France to the thrones of Oden and of Nore; and we perfectly agree in the observation of Lafosse:—

“There is something unwonted and full of intoxicating charms for the imagination, in the homage rendered to the sovereign dignity decreed to the illustrious man, when he owes all his renown to himself alone. It is the triumph of merit and of justice consecrated by gratitude, and nothing is so satisfactory to noble spirits as the spectacle of a whole people discharging such a debt.”—*

Shortly after this period we find the king directing his attention to several objects useful for the country. Foreign sheep were imported, and the production of fine wool encouraged; literary works of importance for the annals of Sweden obtained some support; and military pensions and education received several additions and improvements. Charles John also again gave a very favourable specimen of his powers as a writer in a letter dated April 3, 1824, and addressed to Prince Oscar on his departure for Norway, which land the king himself had before, as he has again since, visited with so much pleasure. His letter is full of counsels and instructions on the duties of a legislator and a ruler; many of the sentiments are full of weight, and great dignity of style pervades the whole.

But, as if again to mock our satisfaction, and destroy our confidence in the more active efforts of the administration, the Swedish government, in 1825, was guilty of another

scandal famous “the whole north over.” The South American States were in rebellion against the mother country, and had as yet been acknowledged by none among the great European powers. But Columbia, which required a navy, commenced certain measures with European houses (for the most part Jewish bankers, &c.), whereby it should obtain, under the disguise of their being for a merchant expedition, first *two* and then *three more* ships of war, armed up to the teeth, and with Swedish government crews, for employment in its service. His majesty and his ministers were tempted by the price, which exceeded their value in Sweden, besides allowing “pickings,” and the expedition would always give employment and experience to the officers and men on board. In the meantime, however, the affair “took wind;” the Spanish ambassador in Stockholm protested against such a bare-faced violation of the interests of a friendly people, and of the rights of nations, and at last *appealed to the Russian ambassador for his interference*. This last step, in consequence of the peculiar position of Charles John in respect to the holy alliance, which still flourished, and of which Alexander was the chief, was instantaneously effectual; an exceedingly determined note from that power demanded the immediate abandonment of the whole design.

The king was indignant and enraged, threatened war or any extreme rather than suffer the indignity and humiliation of a non-fulfilment of his obligations, and expressed great surprise at what was very naturally to be expected beforehand; but the council were cowardly unanimous in abandoning a plan which they had before as unanimously supported, and he was obliged to give way. The bargain was broken, the money and fraudulent “expenses” returned, and the Swedish government *lost in compensation* to the ostensible buyers, the Swedish Jewish house of Michaelson and Benedicks, the sum of *half a million* of rixdollars banco. As usual, however, the power of the government shielded at the diet all the criminals. In the meantime it was fortunate for Sweden that it instantaneously branded the transaction with all the infamy it deserved. Exposing *men* and *materiel* to the speculation of Jew and Christian usurers in direct opposition to the rights of nations and to common decency, selling war-ships, whether new or old, to foreign states, under pretence of their being worthless or merchantmen, and bargaining with intriguing agents for the “best bidder” on the stores of the kingdom, might, if tolerated in a civilized country, at any moment leave the state *sans*

* T. iii. p. 169.

fleet, *sans* troops, *sans* honour, *sans* every thing!

Charles John is a Frenchman; France is a great land power, and the army has consequently always been his favourite weapon. This might all be very well; "*non omnia possumus omnes*," one thing at a time, "*festina lentè*." But we naturally expect from such a great captain the introduction of every possible reform, simplification and improvement, which so experienced a general could have approved for his new country. And to a certain extent, and we admit it with pleasure, such must be acknowledged to have taken place. The spirit and discipline of the troops are excellent; the arsenals of the kingdom are full of military supplies; the education of the officers is much improved, and the engineering and artillery departments especially are now on a very respectable scientific footing. But still innumerable changes, perpetual and most expensive uniform alterations, the multiplication of officers, the lavishing of enormous sums upon all sorts of buildings without the least regard to economy or necessity, and a general spirit of waste and extravagance acceptable to a few of the highest grades, who enjoy comparatively luxurious incomes, but ruinous to the lower class of employes, who subsist upon almost nothing, and consequently are perpetually in danger of demoralisation and of debt—have completely undeceived the nation as to their king enjoying those invaluable *organising* talents for which it had given him credit. On the whole, considering the immense budget now disposed of by the government, compared to that of 1810, the situation of the army, and more especially of the navy after thirty years of peace, is such as by no means to call for the undivided satisfaction or security of the nation they must defend.

On the 26th of September, 1832, the king had the satisfaction of opening the Great Götha Canal, which flows through the heart of Sweden, and connects the North Sea with the Baltic. This magnificent undertaking had been planned and commenced before his arrival in the country, and was generously supported by the grants of the diet; but his Majesty supported its distinguished chief, Count Platen, on many trying and difficult occasions, with the whole influence of the government (which thereby obtained in the count a zealous convert), and may therefore boast of having, in no inconsiderable degree, contributed to the happy completion of this gigantic work. For the rest, his majesty has just reminded us that fifteen millions of dollars banco have been expended in public works since his assump-

tion of the government. The merit of this, however, for the most part belongs to the diet.

The fine arts also have on many occasions experienced his majesty's assistance. On one occasion, we remember, he displayed *un élan de sentiment* much more to our taste, and, in our opinion, much more "*à la Henri IV.*" and really magnanimous, than any of the anecdotes related by Lafosse. The Swedish academy had resolved to celebrate the fiftieth anniversary of its foundation by Gustavus III. Accordingly they made several arrangements for that purpose, and, among the rest, caused a medal to be struck in honour of his majesty, and a deputation of the academy, headed by the late celebrated Archbishop Wallin, had the honour of presenting it for his acceptance. On this occasion Charles XIV. made the following reply, which we will *this once* give entire, and in his own words :—

"Messieurs!

"Instruit par votre secrétaire que les membres de l'académie avaient l'intention de perpétuer par une médaille, à mon effigie, l'appui que j'accorde à vos honorables travaux, je l'ai chargé de vous faire connaître l'étendue de ma reconnaissance; mais en même temps je lui observai que si la protection commandait la gratitude, la création avait le droit d'ainesse.

"Protéger une institution qui existe, est un devoir facile pour celui qui est investi du pouvoir; mais pour créer, il faut joindre au pouvoir qui autorise, le génie qui conçoit et le courage qui fonde. —Un sentiment intérieur, que vous approuverez, m'a porté, en acceptant votre médaille consacrée au protecteur, à en faire frapper une qui rappelle le fondateur.

"Je vous la remets, Messieurs, et je vous prie de la distribuer à chacun des membres de l'académie, en les assurant de la continuation de mes sentimens affectueux."†

The course of events now leads us to

* Gentlemen—Being informed by your secretary that it was the intention of the members of the academy to perpetuate by a medal, containing a portrait of myself, the support that I afforded to your honourable exertions, I instructed him to express to you my grateful sense of your kindness; but at the same time I remarked to him that if the patronage of art commanded gratitude, the creation of it had an elder claim. To protect an existing institution is an easy duty for one who is invested with power, but to create it we must add to the powers of authority the genius of conception, and the firmness requisite to carry conception into effect. An inward sentiment, which you will approve, has induced me, on accepting your medal commemorative of patronage, to order one to be struck which may recall the founder. To you, gentlemen, I consign it, and request you to distribute it to every member of the academy with the assurance of my affectionate regard.

† Recueil de Lettres, Proclamations et Discours de Charles Jean : Seconde Partie. Stockholm. 1838 P. 255.

another and the last *great faux-pas* of the Swedish government—the trial and punishment of the celebrated assessor Crusenstolpe† in 1838. This individual, whose personal character it is by no means our intention here to discuss or to defend, had first risen rapidly into public notice as a member of the opposition in the Swedish House of Nobles. Having, however, doubtless for *substantial* reasons, gone over to the government party, he displayed in their service the same zeal and talent which had already gained him such public notoriety, being their tactician general at the diets, and editing in their interest a newspaper, called “*Fäderneslandet*.” But probably finding himself disappointed in the expectations he had formed from the government promises, he suddenly turned round, and commenced the publication of works which have constituted an epoch in Swedish literature for the playful, light, conversational, kaleidoscopic beauties of their style, mixed with the most bitter attacks upon the person and family of the king, and the whole policy of the government at large. The mixture of anecdote and small talk, of scandal and of “secret history,” in these publications, rendered them at once excessively popular, and their frequent mistakes or misrepresentations were only dishonourable to the author, without making them less acceptable to a curious, astonished, and delighted public. But such was the caution of the writer, such the prudent wrapping-up of the most caustic insults in the most mellifluous panegyrics, that it was difficult to imagine any other method of reaching the writer than prosecuting the *tendency* of whole passages in several of his latest productions. This the government omitted to do; instead thereof it commenced, after long delays, an action for *high treason* against a *single sentence* in one of his letters, in which he had, with great truth and in an *innocent, jesting style*, accused the *council* of Sabbath-breaking, for having issued a certain officer’s commission of advancement on the Sunday. This was so extraordinary, that people could not believe their own ears and eyes. The *council* is responsible, the king is sacred; if it be high treason to state facts or arguments relative to the council, (although the king be a member thereof,) then is his majesty, who governs through this unimpeachable council, a sovereign despot. The conclusion is plain and irresistible. The action, however, proceeded. A jury,†

even according to the Swedish law, illegally and dishonourably chosen, gave their sentence of *guilty*, and the prisoner was condemned to three years’ solitary imprisonment! This decision outraged every feeling of dignity and right in the nation; sympathy was excited for the liberty of the people and of the press, so foolishly attacked in the person of a favourite author, and large crowds cheered him in the court and on his road to prison. But the day of his deportation arrived. Circumstances occurred which excited well-grounded suspicions of agitation and discontent among the lower classes. The moment of his transportation was imprudently delayed, the crowds increased, the military force was ridiculously small, and was left to its fate, though only some hundreds of yards from the garrison troops, and the natural result was a kind of vulgar *émeute*. During this coarse but not unexpected expression of the instinctive hatred of the mob and the masses to injustice and oppression, the town-house (where the prisoner was confined) and its guard were attacked; the military were compelled to fire in self-defence; and *after* Swedish blood had for the second time flowed in civil tumult during the reign of Charles John, a reinforcement cleared the streets, and put an end to the disorder.

This is the epoch of the rapid fall of the fame and character of the king and his servants. Since then, scores of books, hundreds of pamphlets, increasing poverty, and general dissatisfaction have so far enlightened the public mind of all parties, that the voice of the opposition has become the voice of the nation, the enchanted palladium glory of the aged monarch is waning fast away, inquiry into all departments of his administration brings forward daily discoveries of neglect, abuse, and imbecility, and the diet now sitting will perhaps become the instrument of constructing, *de novo*, the representation, the constitution, and the council!*

That Charles John should have omitted

the Swedish law, is in connection with the liberty of the press; and even then, it is a partial and mangled misrepresentation of that great bulwark of national freedom. It consists of nine members, of whom six must be unanimous to procure a verdict of guilty. But three are chosen by the prosecutor, three by the prisoner, and three by the presiding court. Consequently, in government prosecutions, the jurymen nominated by the crown and the court may reasonably be supposed to be unanimous, and the prisoner’s doom is fixed. Besides, the jury have to decide only respecting the *law* and not the *fact* of the case!

* There is no doubt that Charles John is not so much to be blamed for his prosecutions against the press as his councillors, weak and interested blinders of his judgment.

† The only case in which a jury is allowed, by

* Since writing the above, a law has passed the diet, making the council a regular, responsible ministry, and most of its former members have been replaced.

the brilliant opportunity presented him by Sweden and by Providence of giving life and freedom to the languishing trade, commerce, manufactures and legislation of his country, and of re-constructing the present worn-out political form of government, in which four chambers each sixth year—

“Like wounded snake slow draw their length along”

with a want of power, unity and efficiency alike destructive to the interests of king and people, must excite the surprise and regret of every admirer of his remarkable career. It is true that a fear for his throne and of the intrigues of the holy alliance may have kept him back during the former part of his reign, but twenty years have since then elapsed, and nothing has been done. There has been a perpetual and unworthy nibbling at the laws and rights of the people, a supine neglect of all the higher duties of the legislator and the statesman, a system of corruption by showers of stars and titles, a luxury of administration and of living in a poor and exhausted country, and an evident leaning to a military despotism abroad,* and to tyranny at home, which have very naturally *at length* produced feelings of great discontent and bitterness among the mass of the people. In general, the details of the administration are in as great confusion at this moment in Sweden as they were thirty years ago. And how valuable is the interval? A generation of profound, of uninterrupted peace! It is true that the population has increased; but this is not always

* Amongst those events which most wantonly and unwarrantably shocked every feeling most sacred and most natural to the Swede, was the baptism of the fourth son of the Crown Prince Oscar in 1831, by the name of *Nicholas*, in homage or compliment to the illustrious czar. This, too, to the *occupiers of Finland*! The silent and yet alarming progression of Russia in every direction is quite evident *now*, and we do not know one European or Asiatic power on which she does not meditate similar incursions. Poor Turkey is almost her own; and so is Greece. Circassia holds her at bay, but will share the fate of Poland, if not assisted. Persia is with her; India and China are obviously next in contemplation; Prussia and Austria must keep a sharp look-out; and even France is narrowly watched, in the hope of some convulsion in the unpopular dynasty of Orleans, to push forward a candidate for the throne, such as Prince Louis Napoleon, were he sufficiently facile (and he knows full well the feeling of his correspondent at St. Petersburg, the *Chevalier St. George*, alias the *Czar*) to sink into a satellite of the great northern planet, and to wind about her political centre, partaking of all her mutations and affected by her influences. We shall never cease to point attention to the extreme danger to be apprehended from her upon every point of European or Asiatic territory.

a benefit; and at all events this at least can scarcely be boasted of by a government whose best characteristic is, to have done but little, and that little seldom well! A few laws and improvements have certainly been made, but they have been mostly at the wish and after the plans of the diet itself. In short, without, like Lindeberg, blindly denying the government *any* merit, and we have freely acknowledged that many changes for the better date themselves from Charles John, we may safely conclude, that the immensely costly, however otherwise amiable dynasty of Bernadotte has as yet been productive of few advantages to Sweden, many to itself.

In Norway, on the contrary, we meet a very different picture. Instead of increasing, we find almost vanishing taxation. Instead of commerce in ruins, we see a vastly extended merchant-fleet ploughing every sea. Economy, trading liberty, and a free representation have lifted the country to a rank worthy its old renown in the annals of Scandinavia. It is true that his majesty, no doubt from good motives, has repeatedly attempted to persuade the Norwegian *Stor-things* to sacrifice to him the great bulwarks of their republican organisation, and to admit a system which would have nearly assimilated them to Sweden; but it is also true that they have at each successive diet calmly and magnanimously refused, and that the admiration of Europe and the prosperity of their beautiful land has been the result. In Norway the king is the patron of improvement, because it is a happy and highly-developed country that makes its president (whether he be chosen or hereditary) *strong*. In Sweden the king, or his interested minister, jealously guards every thing in a *status quo*, because the monarch of a highly-taxed and ill-represented people must govern rather by intrigues and corporate interests than by national votes. In Norway we find the government friendly to reforms, and popular among every class; in Sweden we see fast-rooted abuses and increasing discontent.

In the meantime, to give an idea of the gradual development of the government system of Sweden, we append on the following page an outline of the budgets fixed at the successive diets from 1810, when the French marshal was elected crown prince, to the diet of 1840, which is at this moment sitting in the capital.

But we must here say some words respecting the literary and historical qualities of the works at the head of our list. The first is by a Norwegian writer of some celebrity, who began his career as a violent enemy to the details of the union, and who

* This head embraced both the land and sea departments up to the diet of 1823, when they were stated separately. The fourth head was previously devoted to ecclesiastical and educational grants. For the sake of simplicity, however, we have transferred these last to the tenth head, which they now constitute.

† This section is for offices which expire with the present owners, or till they obtain some other appointments, &c.

‡ By the extra loan from the government-debt bank, the actual annual budget after 1835 amounted to 10,898,190 dollars.

§ The sums for 1840 are the budget demanded, not the grant made. As far as can be judged at present the grants will not exceed those of 1830. The exchange averages twelve dollars banco to the pound sterling.

some time after the publication of his *Life of the King* received a pension from his majesty to assist his literary studies; and it is written with meagre details, but with tolerable correctness for a hastily compiled work, great liveliness of style, and an *approach* to impartiality uncommon in the biographers of Carl Johan.

The production of M. Lafosse* is, up to 1810, moderately complete, and generally worthy of credit. But after that period it is for the most part a continued running panegyric on "the hero of the north." *Not one single fact* at all calculated to injure the fame of the great Bernadotte in the eyes of admiring Europe, is allowed circulation through his pages. For the rest, the style is pretty enough, and the author is a man of sense and experience. In such a case, a few glaring misrepresentations must be looked for, as inevitably connected with his purpose.

The volumes of Captain Lindeberg, which have produced an immense sensation in Sweden, may be regarded as the exact chemical opposites to those of Lafosse. The one is alkali; the other naught but a tartish acid. The captain's book, however, is the most valuable source we know for enabling the historical student to complete his knowledge of the real character of the Bernadottean epoch in Sweden. But his style is too prosy, heavy, and hard; his views are often exaggerated and one-sided; and the personal pique of an injured man is visible enough in his calm statistics. Still, we repeat it, no investigation of this period can be complete, without the assistance of the laboriously compiled and, *as far as they go*, trustworthy volumes presented to us by this great opposition champion.

But this reminds us, that we have as yet given no important specimen of the captain's paragraphs. We therefore close this article with a very appropriate *summing-up* by our Swedish Cobbett, which we extract from his second volume, page 74, &c.

"..... If we are to judge from the words of our state chief, no Swedish ruler, according to his opinion, so far at least as it has yet been publicly expressed, has done so much for his country and has such wide-spread claims to the love and gratitude of the people as—himself..... A single phrase is often full of meaning on this point, and the remark perhaps is not therefore without importance, that the motto of the present king is of a quite different character from that of all preceding sovereigns. Thus, for instance, that of *Frederick* was—*God my hope*; *Adolph Frederic's*—*The general weal my weal*; *Gustavus III.'s* was—*Our fatherland*; that of *Gustavus IV. Adolphus*—*God and the people*; and *Charles XIII.'s*—*The People's weal my highest Law*; but *Charles John's* motto is—*The Peo-*

ple's love is my reward. All preceding kings thus displayed their feeling of their duty, or the hope humbly living in their hearts. The present king alone advances a claim to a reward, and that the most brilliant any regent can desire or gain—the people's love. But we willingly admit, that a word is often nothing more than a word, and sometimes much more is wanted by which to judge the action. But complete speeches, after mature deliberation, made to the whole people assembled through their representatives,—surely say much more. Thus when Gustaf Wasa, that man whom no one has dared call *the great*, as this might be in some measure comparing him to others, although no one can be found to be compared to him, on completing his 70th year, felt his strength decreasing and imagined his end to be at hand, he thus addressed the states, on the 16th of July, 1560:—'I do reverence the care of eternal Providence, which has been willing in and through me again to call to life the ancient and well-loved stem of King Magnus Ladulås and of Carl, after it had been compelled during so many hundred years to lie despised and beaten down; through the tyranny and violence of foreign masters. It is surely one of the works of God that, even as David from the herdsman's cottage, I should be sought out, drawn forth, and at last anointed as the king and governor of this realm. That I should reach such honour I never could have imagined, when my birth was as yet forgotten, and I was driven to hide me behind the mountains from the cruel sword of bloodthirsty Christian. But God and the commons of Sweden have been my help. And therefore do I give you thanks, my dear beloved children and my faithful subjects, for that ye should thus show favour unto me, and lift me up to royal dignity, and acknowledge and proclaim me as the father and founder of your royal house. If, my dear subjects, I have been able to work out aught good, give God the praise thereof; but all wherein human weakness hath made me fail, belongeth to me alone, and is such the which ye must pardon me for Christ his sake.'—With a pardonable pride he further uttered the persuasion that posterity, which he trowed would not soon forget him, would do him justice, and that the time would come when they would dig him up again out of the earth if that they could so do—a prophesy which was too soon fulfilled—but as a protection against all threatening dangers, he counselled his people to hold fast by God's word, and prayed them to follow him to God with their prayers.

"When the great Gustaf Adolph, after a reign of nineteen years filled with perpetual struggles and dangers, out of which nevertheless he himself and his kingdom rose triumphant, and in spite of which both had become established in strength and in fame,—after he had recovered a peace with Denmark which was purchased dear, but with undiminished borders,—after having acquired by the peace with Russia the districts of Ingermanland and of Kexholm,—after having conquered Livonia, and though endeavouring in vain to make peace with Poland, having still at last compelled it by his exploits to a truce which left the Swedes in possession of all they had subdued;—when after all these employments, he marched to dare the most perilous of all contests against the mightiest monarch then in Europe, a contest, however, for the light and liberty of the world,—he also collected around him the chambers of the kingdom, recommended his infant daughter to their care, and thanked them for their readiness to grant the taxes asked for carrying on the war, especially as he well knew 'that only with great difficulty could they be paid.' Nevertheless they should thank God—not his sword—for

* The work of Lafosse has also appeared in a German dress.

having kept their kingdom during so many years from the ravages of war, and for having lent them such good fortune in victory and in conquest. Thereafter spoke he of the approaching war, its dangers, and its lofty objects, straightway adding:—“For what regards myself, I know full well all that can befall me; already have I many times and oft for Svea kingdom spilled my blood, and one time or other shall doubtless spill my life, for so long the pitcher goeth after water, till that at the last it be all cracked and broken. Therefore, before I this time separate from my fatherland I will with fervent prayer commend ye all, inhabitants of Sweden, present as well as absent, to the protection both for life and soul of our God most high, hoping that when our time shall come we may all meet each other in a joy that never perisheth!”—To his placemen gave he counsels and warnings many, wishing them strength and understanding to fill well their offices. Then to the clergy spoke he of union and real piety, while to the nobles he pointed out the road to his favour and to unfeigned knightly lustre and renown through bravery and exploits. To the people he spoke thus:—“And you burgesses and commons here assembled, wish I all kinds of happiness and good fortune. May your humble cottages be changed to durable houses built with stone, your little boats to large capacious ships, and may your fields and meadows fill your barns and stores a thousand fold, to the great enrichment of yourselves and country. Yes! all of ye, beloved inhabitants of Sweden, do I pray God mercifully to comfort and protect, and now give to you my hearty farewell,—perhaps never to say it more!” The king had in all this not one word about his own great deeds, not one word about his ceaseless labours, during the short intervals of battle, for the domestic organisation and for every thing that could tend to the gain and glory of Sweden; he did not even mention how he had given the whole fortune he had inherited from his father to the university of Upsala, thus making himself poor that his country might be rich in knowledge and in wisdom;—in one word, he thought not at all of himself, although his coming fate hovered before his spirit, and he had already given orders to begin building his tomb: No! it was to God alone he attributed what he had done; and to him therefore gave he the glory.

“When Charles XIV. John, after nineteen years of residence among the people which had called him, an unknown foreign soldier, to the throne of Sweden, which had now been his own for twelve years, dismissed the representatives of this people in 1830, he said to them among other things: ‘That he had been called to defend you,’ and that the constitution framed by the state ‘required to be confirmed by war and victory.’ The same good fortune has followed my endeavours in the path of the administrator as in that of the warrior, and Providence has extended the success of my efforts further than your wishes dared to stretch themselves.”

“We are further informed how the ancient Sweden, twenty years ago, only reckoned 2,400,000 inhabitants, whereas its numbers now reach nearly 3,000,000; that the kingdom then had fifty-three millions of dollars of National Debt, of which forty four millions have been extinguished, and that while the benevolence tax amounted in 1812 to 2 650,000 dollars, it had been since reduced gradually by nearly a fifth part. The king congratulates himself on having done away with the hindrances to the completion of the Götha Canal. ‘My administration has seen itself induced to check its

career, to seek the origin of the hindrances which meet it, and not expose to dangerous accidents the new energies and the national spirit it has called forth. It has succeeded in extricating this peninsula from the misfortune of civil discord and its unhappy consequences. I have subdued the irritations of ambition and of force of arms, and have made them obedient allies to the laws. Rather a mediator than a monarch, rather protector of the law than a prince, I have endeavoured to uphold all legal and legislative rights, without in the mean while losing sight of the moral force of the monarchy. In a word, I have sacrificed all to the union and prosperity of the two kingdoms. Persuaded of their common wants, Swedes and Norwegians have ceased to shed each other's blood and to destroy each other's property. . . . After having consolidated your political rights, my whole anxiety has been directed to the support of the fundamental law. I have preserved it uninjured. Let us calm all interests, and so arrange our situation that he who lives by his labour may not need to fear that to-morrow he may find the resources for his existence cut off from him. Should it be that our representation requires an improved organisation, still let us never forget, that the four chambers of the realm have constituted during three centuries the pillars of the legal monarchy. . . Before I go to unite myself with that king who adopted me as his son, I feel myself happy in having acquired the right to say to you—understand your government; the good it has accomplished gives you cause so to do.’ . . . [Similar language pervades the speeches from the throne at the diets of 1835 and 1840.] . . . The difference of tone in the addresses of these three kings to the nation is so remarkable, so strongly contrasted, that we need not direct the attention of our reader to it. . . .

“In the former volume of this work we endeavoured to discover to what height of glory, power and happiness it really was, to which the country since 1810 had been ‘lifted up.’ The result of our inquiries has been, that Sweden during this time has won no victories on the field of glory, has not extended its territory, but instead thereof has lost the opportunity for so doing which in all probability occurred,—has seen its old conquests sold away, and the new one, which it might perhaps have obtained, changed, not to a gain for Sweden, but to a present to its king individually. We have seen the advantage afforded by a fortunate conjuncture—that of a foreign colony being made over to our country, transformed into a benefit for the Crown Prince himself. We have seen the royal majesty, in order to uphold its dignity, develop a severity as yet without example in our history. We have seen the liberty of discussion which was appropriated to itself by the Swedish people before the 5th of November, 1810, after this period suffer frequent mutilations, partly by the laws being illegally modified, and partly by their being applied in a different spirit from that in which they were enacted. Lastly, we have seen the taxes levied in the kingdom, since the above-named epoch, trebled in amount. All this is, after the common ideas of mankind, no benefit to a country, either in boundaries, in money, or in freedom. As, however, in developing the plan of this work, in order to do away with every just accusation of partiality,—we have followed the principle to extend mildness and liberality as far as the limits of justice possibly can permit, so we acknowledge that a government may be one neither of conquest nor of victory, and still honourable and useful to the country by upholding its dignity abroad and

increasing its prospects at home ;—that it can lay increased burdens on the people, when at the same time it increases their resources, their trade and their prosperity, and consequently the ease with which they can be borne,—nay ! that even, led by a lamentable but not uncommon policy, it may dread freedom of discussion as something liable to oppose its views, and yet love the people and labour for their benefit. Such conduct, for instance, cannot be denied to Napoleon and to the Russian government, although both by no means favoured the liberty of the press. This fear always must be a stain on the real greatness of a government, but it can be disguised by the lustre of other and substantial merits. We will examine, then, how far the government possesses such in reference to the improvement of the country materially and morally. In spite of the faults we have already been forced to point out, it might have been able to advance commerce, agriculture, manufactures, arts, sciences, and the defensive force of the kingdom ;—it might have taken care that its placemen exactly fulfilled their duties, and that its people gained more and more in comfort, prosperity, content, enlightenment, and intellectual and moral strength, and thus—partly by a prudent calculation and partly against its own plan—have created all these elements which in their development lay the foundation of the real glory and power of a state, because they lay the foundations of a people's pride, energy and independence, and thereby of its feelings of liberty also. Let us now see what it has done for these objects in general, or for any one of them in particular !"

The answer to this inquiry must be, in the judgment of every impartial observer, very unsatisfactory. It is true there have been many excuses for the lamentable neglect. His majesty's ignorance of the vulgar tongue, (though a fact more to his dishonour than his excuse, for after thirty years of residence he should at least have been able to *read* the language,)—the strength of the parties interested in the abuses of the country—the *royalistic* and unmeasured flattery dealt out to him for so many years, not only by all who approached his person, but by the diets themselves, (a flattery resulting from the miserable representative system, and the falseness and want of sound manly character unfortunately too common at present among the higher and middle classes in Sweden)—and the obstinacy of approaching age on the one hand, together with the power of his favourites, and the ruling camarilla on the other,—all these and many other reasons must plead in mitigation of the severity of our sentence against him.

Let us hope, however, that this old hero, this general so illustrious during so many campaigns, this chief of the army of liberation which struck the mighty tyrant to the earth, this remarkable and accomplished founder of a new dynasty in two great northern kingdoms,—will not outlive his fame, or permit the sun of his career to set in opprobrium, hatred, or contempt ! He

has yet time before him. Providence seems to have lengthened out his days beyond the number of the years of the children of men, and to have given him a "green old age,"—even uncommonly remarkable for its spirit, vivacity and vigour—that he might happily finish the important work he commenced thirty years ago. The law just adopted and sanctioned by his majesty for commencing in Sweden a real *bonâ fide* system of ministerial responsible government, and the dismissal of so many of the councillors and ministers most obnoxious to the diet and the people, are, we hope, tokens of good both to prince and peasant. No one admires the bright qualities of Charles John more than we ourselves, and to them we appeal against the narrow and unworthy policy of his later years. Let who will lament—we, in common with his faithful subjects and all lovers of the north and its prosperity, should hail with unfeigned delight the reviving lustre of his crown, and the re-establishment of his "fame and name and exploits" on a foundation so firm and sure, that it never should be moved from the one generation even to the other. He has still time to *die à-propos*. Yes ! the recording angel of history stands ready, ere he goeth down into the house of the tomb and is no more seen for ever, to inscribe on the tablets of Scandinavia hopes deceived, broken promises, and the unregarded prayers of an indignant people, or an immortality of glory freshly springing up from renewed institutions, enlightened and remodelled laws, trade and commerce freed, and a fresh impetus—whose goal none can see—given to the energies and liberties of an ancient, brave, illustrious, and still core-sound nation. One power at least, who is daily adding province to province, satrap to satrap, and crime to crime, whose cannons can even now be heard in the Swedish capital, who has every where her agents, and who subsists only on the weakness and disorganisation of the states around her, is—"ready, aye ready."

ART. IV.—*Osteographie, ou Description iconographique comparée du Squelette et du Systeme dentaire, des cinq Classes d'Animaux Vertébrés recents et fossiles, pour servir de base à la Zoologie et à la Geologie*, par M. H. M. Ducrotay de Blainville, Membre de l'Institut (Académie des Sciences), Professeur d'Anatomie Comparée au Museum d'Histoire Natu-

relle. *Ouvrage accompagné de Planches, lithographiées sous sa direction*, par M. J. C. Werner, Peintre du Museum d'Histoire Naturelle de Paris. Texte grand in 4to Velin; Planches in folio format demi-Jesus. Fasc. I.—IV.

THE general taste that prevails amongst all classes of educated persons for examining the laws which have regulated, and the phenomena that have accompanied the formation of the globe, has rendered geology one of the most popular sciences of the day; so much so, indeed, that it probably ranks amongst its votaries a greater number of individuals belonging to the various professions than any other branch of learning. It would appear from this fact to be taken up by many as a mere amusement for leisure hours, and therefore the conclusion might at first be drawn, that it is a science which can be acquired without much mental exertion, and without the sacrifice of much time. A superficial knowledge of it may indeed be obtained without much effort, and in a short period, but any one who wishes to become profoundly acquainted with the remarkable truths brought to light by geological investigation, who is willing to test the correctness of the observations recorded in its annals, and who may feel disposed to speculate in theoretical explanations of the changes which have occurred on our planet, must be prepared to devote the best part of his life to the pursuit, before he can hope to have his exertions crowned with much success. Great encouragement to exertion exists for those who are really willing to give themselves up seriously to this pursuit, for as a comparatively unbeaten track of knowledge, it still affords an immense field for the observation of new facts, many of which, when discovered, will no doubt cause great modification, if not entire subversion of some of those theories which at present appear to be most satisfactorily established.

Though geology may be regarded by a great number of individuals more as a superficial or popular branch of knowledge than a science, never probably was a greater error committed, for next to astronomy no science ought to rank higher; not on account of the apparently rapid progress it has made in a few years, for at present it is only in its infancy, but from its intimate and important connections with most of the other sciences: indeed, so far from geology being only a branch of what at the present time is termed popular information, a profound acquaintance with it is unattainable without an extensive knowledge of astronomy, geography,

mineralogy, natural philosophy, chemistry, botany, natural history, comparative anatomy, &c. Such is its vastness, that for the purpose of facilitating its progress, the same kind of subdivision has been introduced into it as has been made in other sciences. Thus we find that some of the most talented individuals of our time, who have been most instrumental in advancing it, have limited their researches to one branch only:—whilst Lyell and Elie de Beaumont have speculated upon the causes of the position of the different strata, and the upheaving of mountains and continents, Cuvier and Buckland have drawn most important deductions from the remains of organized beings found in the different deposits. Other equally celebrated persons have distinguished themselves by furnishing information to facilitate the determination of the particular species to which these remains belong; a task which is rendered peculiarly difficult when only a few portions of the skeleton of an animal are discovered. An intimate acquaintance with the comparative anatomy of the osseous system of different animals is indispensable, before any probability can exist of its being possible to determine the species to which any fossil bones may belong.

The object of the work under consideration is to afford persons who have not opportunities of studying large collections of skeletons of different animals, the means of gaining some knowledge of the comparative anatomy of the osseous system in the five classes of the vertebrata. It is to be published in parts, four of which have already reached this country; the text is illustrated by lithographic plates, representing the skeletons of the vertebrated animals, both modern and fossil; and if the author bestows the same pains on the succeeding numbers that he has on those which have already appeared, he will confer an immense benefit on the scientific world. The celebrity Monsieur de Blainville has obtained as a naturalist and comparative anatomist, is of itself sufficient to attract attention to this work, which we are inclined to predict will raise his reputation still higher. No individual at the present day, probably, is more competent to perform this undertaking than Monsieur de Blainville, for his researches have always been more or less connected with this subject, as well as the lectures which he has delivered during the last twenty years at the Sorbonne, Jardin des Plantes, &c., and therefore, though from the nature of the work some time must elapse before the whole can be published, there is every probability of its being ultimately completed within a reasonable pe

riod, and in the same efficient manner in which it has been commenced. He has also at his disposal the magnificent collection of skeletons of the Museum of Natural History in the Jardin des Plantes, which is probably the most extensive in this department in Europe, the collection of fossils described by Cuvier, which has latterly been nearly doubled by the addition of those obtained by L'Abbé Croizet, in Auvergne, and by Monsieur Lastet, in the environs of Auch, besides a considerable number of models in plaster of fossils discovered during the last few years in India, America, and in Germany. The object the author professes to have in view is to afford geologists, who, it is very properly remarked, are seldom naturalists and less frequently anatomists, the means of determining, as far as that is possible, to what part of any of the vertebrata one or more fossil bones may belong; further, of ascertaining, no matter how obscure the fragments under consideration may be, to what class, order, or family, the animal belongs to which they may appertain; and lastly, to what species, and whether the species differed or not from those living at the present era. The works which have hitherto been generally referred to for this information are those of Cuvier, Parkinson, Pander, and D'Alton, but the plan adopted by these writers is not so good as that followed by Monsieur de Blainville, who besides giving plates of the bones of the vertebrata both modern and fossil, has likewise given figures of the teeth, which is a most important addition, and has never been done before. Indeed the teeth, upon the whole, may be said to be more useful to the geologist in enabling him to determine the species to which an animal belongs, than any other part of the body. The plates seem to have been executed with much care, and what is very important, the proportions of the figures represented must be accurate, as they have been preserved by means of the "*diagraphie*." They consist of five series. 1st, the whole skeleton is represented; 2d, the crania; 3d, a selection of parts peculiar to the animals; 4th, the teeth, with their roots and alveoli; and 5th, fossil remains, and copies of representations of the animals left us by the ancients.

The work commences with a dissertation on osteography, including some account of the different articulations, or surfaces by which the bones are united together; this part will be found interesting to the geologist, because the articulating surfaces always present peculiarities corresponding to those of other parts of the skeleton. Besides, the extremities of bones are among those por-

tions of the skeleton that are most likely to be met with in fossil remains, on account of their having greater bulk than the remainder of the bones to which they belong, in order to afford sufficient space for them to be united with the corresponding parts of other bones, to form the joints. In the long bones the texture also is different from that of the shaft, being generally composed of denser material internally, and coated with a layer of hard osseous substance, to protect them against injury from the continual friction to which they are exposed in the motions of the ends of the bones upon one another. On this account, though the shaft of a bone may have been destroyed, the articulating extremities of it are often found in a sufficiently perfect state to enable the comparative anatomist to draw very important conclusions from them.

In speaking of the bones in general, our author says—

"The consideration whether a bone is symmetrical or non-symmetrical is of great importance, and is the first question to be decided by the geologist or paleontologist when examining a fragment of a bone. If it be symmetrical, which it is always easy to determine, it must belong either to the vertebral column or the sternum; if non-symmetrical it belongs to some appended part of the skeleton, which cannot be determined with the same facility, as for example, in the instance of the bones composing the middle finger."

Monsieur de Blainville includes the teeth in the class of bones which he has termed "*Phaneros*," of which he gives the following description:—

"To comprehend the general form of a '*phaneros*,' it is necessary to know that it is a portion of dead matter, produced and exhaled from the surface of a bulb or '*phanère*,' which is in organic continuity with the body of the animal, and implanted more or less profoundly in the skin, or sometimes in the subjacent tissues: the form of the bulb has therefore great influence upon that of the '*phaneros*' or body proceeding from it."

The hairs, as well as the teeth, are considered by most physiologists as productions of the same kind, both being regarded as appurtenances to the skin or integuments, emanating from bulbs of a similar character.

The remarkable property of preservation which belongs to bones, results from their being composed of earthy and animal matter, intimately blended together. When a recent bone is steeped in diluted hydrochloric acid, its earthy particles are dissolved, and the animal portion is obtained in a separate condition in the form of a membranous substance, preserving the shape of the bone, but without its solidity. The same results are procured when a fossil bone is treated in this manner, notwithstanding it may have

belonged to an animal whose race is now extinct. By the action of heat the animal portion is destroyed, and then the earthy substances are obtained separately. The relative proportions of these organic and inorganic elements vary exceedingly in different classes of animals, and in different bones of the same animal. In the cartilaginous fishes the organic matter is superabundant; but in the petrous or rocky portion of the temporal bone (so named on account of its extreme hardness) of the higher orders of the vertebrata, which contains and protects the delicate organ of hearing, the quantity of earthy matter is greatly in excess. This part of the temporal bone in the elephant is as dense as marble.

"The osseous system in the mammiferæ differs greatly from that of the other classes of vertebrata, because it is composed of a very much greater proportion of inorganic matter than of organic, which latter is almost entirely gelatinous, and its intimate union with the inorganic or earthy matter enables it, under certain circumstances, to resist decomposition for an almost unlimited length of time after death; indeed, fossil bones procured from the quarries of Montmartre became blackened when Vauquelin exposed them to the action of fire."

Such is the extraordinary quantity of animal matter in the skeletons of some extinct animals, that it is stated, when the bones of the *Toxodon* are heated in the flame of a spirit lamp, they not only exhale a very strong animal odour, but likewise burn with a slight flame.

When a fossil bone is discovered, it is not always so easy, as is generally supposed, even for a skilful comparative anatomist, to determine with certainty to what animal it belongs, and what peculiarities that animal possessed, on account of the great variety offered by skeletons of animals which are of the same order. The number of bones in different divisions of the skeleton is by no means constantly the same; the same number of vertebræ, of phalanges, &c. are certainly most frequently met with in all, but exceptions occur which are sufficient to throw a doubt over the whole. For instance, the mammiferæ in general have only seven vertebræ in the neck, but the sloth, however, has nine. It would therefore be impossible to decide from the imperfect skeleton of an extinct animal nearly allied to this creature, whether it possessed the same number of cervical vertebræ as our sloth, or whether it had only seven, like most other mammiferæ.

"The number of bones in the skeleton of the mammiferæ is never sufficiently constant to be called certain, unless in any particular part, as for instance in the case of the cervical vertebræ, which are seven in number, or of the phalanges, which

are only three; in neither case, however, are these numbers absolutely constant."

The following observations are well worthy perusal, as they point out more in detail the difficulties, if not impossibilities, of determining with certainty all the peculiarities of the entire skeleton of an animal, of which only a few bones are possessed.

"Without doubt between all the solid portions entering into the composition of the skeleton of a vertebrated animal in general, but of a mammiferous one in particular, there exists a remarkable harmony between the number, form, position, proportion, and a combination producing a peculiar kind of locomotion, so that within certain limits at least, it is possible to prejudge from physiological knowledge, certain osteographical peculiarities, and vice versa. This is an observation which has been continually made from the time of Galen; but to imagine the science is so far advanced, or that it can ever be brought to such a high degree of perfection, so that from a single bone, or only one surface of a bone of any animal, it is possible to re-construct, or re-compose its whole skeleton, and afterwards the remainder of its organisation, is a pretence which will appear more exaggerated and more extraordinary, in proportion to the depth with which the question has been examined, both a priori and a posteriori. In my opinion no one has ever been able to do this, no matter what it has been pretended to be possible to do. Individuals very probably may have supposed they could do it, because when they have possessed a particular bone of one animal closely resembling that of another animal, perfectly well known, whose skeleton was present, and to which no remarkable peculiarity belonged, it may have been possible to determine the form the bone joined to it ought to have. Beyond this, however, all is mere conjecture, unless this key-bone should be characteristic of a certain family, as the astragalus in Ruminants, whose skeletons are very similar, and have teeth and a digestive apparatus quite peculiar to themselves: but even in this case, the astragalus could not give the proportion of the other bones, nor enable any one to decide whether there existed rudiments or not of the external pair of toes, a complete fibula in the posterior, or a cubitus in the anterior extremities, or canine teeth in the upper jaw; whether the frontal bone was furnished with horns or antlers, and whether there were one or two pair of them. But if it be impossible in such an easy family as this, to deduce from the examination of a bone, so characteristic as the astragalus in Ruminants, all the above named peculiarities, how would it be with a family where the gradations are less marked, and especially in animals whose locomotive apparatus presents peculiar anomalies. Indeed it may be confidently asserted that in such instances, even if a particular bone were chosen, it would be impossible to decide accurately on the form of those which should come next to it.

"In the skeleton of the *Simia Pithceus* what bone besides the sacrum could lead to the conclusion that this animal has no tail, whilst the greater part of the other *Cynopithec*i are often furnished with a very large one? the lumbar vertebræ in this creature have their spinous processes placed in a similar direction to that which they have in the *Cercopithec*i. What bone except the trapezoides could enable any one to decide that a *Simia* of the divisions *Colobus* or *Ateles* has no thumb? What part of the extremities of a sloth could lead any one to foretell whether the animal has seven, eight, or nine cervical vertebræ? Had the head only of the radius

of this animal existed, what would be the peculiar form of its fore-paw? and what the number of digits? Would it not be useless to endeavour from the singular form of either of the toes of the *Dasyurus* to point out the shape of the other? The *Cheiroptera*, like the *Talpæ*, have a longitudinal crest on the sternum, to increase the surface for the attachment of the pectoralis major muscle, in order to render it larger and therefore fitter for moving the arm: but any attempts to guess from this peculiarity the shape of the humerus would be sure to lead to error. Is it possible to determine the form of the scapula of the *Talpa*, from its singularly shaped humerus? Could it be decided from any part of the fore-foot of a particular group of the *Carnivora*, that the humerus is perforated at the internal condyle, and that it is not so in another group of the same animals very much resembling the former? How could any one discover the relation between this peculiarity which exists in all the *Didelphis* without exception, and the co-existence of the marsupial bones which are never wanting in this class? If the still greater error be committed of expecting to find a relation between the teeth, and the skeleton and its peculiarities, how could any one guess from examining the skeleton of the large-eared dog of the Cape of Good Hope, that its teeth were so different from those of other dogs both in form and number? What connection is there between the carnivorous teeth of the *Dasyurus* and those of the *Phascolumys*, which are perfect rodentia? And yet the condyle of the lower jaw is not placed more transversely in the one than in the other. Is there any peculiarity in any bone of the anterior extremity of a carnivorous animal, which could lead to the decision that it did or did not possess a clavicle?"

It will be seen from these observations, which we particularly recommend to the consideration of the geologist and paleontologist, that the determination of the peculiarities of any skeleton, a few portions only of which can be procured, is an undertaking very difficult to be accomplished, even by those who possess an extensive knowledge of comparative anatomy. In fact, its impossibility has been shown in a great many instances, which must throw a great doubt on the correctness of many of what are termed the restorations of animals, that, in the course of the last few years, have been brought out rather hastily, and with too much presumption. It would be well for geology if such attempts were less frequent and made with more caution, or otherwise they will tend to bring the science into disrepute. They never would be undertaken so indiscriminately, if persons were more aware of the difficulties that attend them; and then we should not be so often astonished, as we are at present, with drawings of most extraordinary looking animals, which are pompously described as faithful representations of creatures that swarmed on the surface of the earth before the creation of the human race. Many of these restored animals are probably just as incorrect as a human skeleton would have been, made upon the scale afforded by the remains of the shells of

some enormous turtles, discovered some years back, and which were at first asserted to be portions of human crania, because they had serrated edges like those forming sutures. Resting on these observations, many persons imagined that a race of human beings with heads three or four feet in diameter had formerly existed upon the surface of the earth; this opinion seemed plausible enough, supported as it was by the statement that these bones had belonged to human crania, and its absurdity was not perceived until they were really ascertained to be portions of the shells of turtles. How it happened that the public were not favoured on this occasion with some restorations of the human body on a commensurate scale of magnitude, is not known. It is, however, by no means improbable that errors equally gross are being continually committed by incompetent persons venturing to decide from insufficient data, what the entire structure of an extinct animal may have been. We have long blushed for philosophers who have so egregiously committed themselves in this manner, and it is to be hoped that the hints given in M. de Blainville's work will make them reflect a little before they venture to publish as facts, what in the majority of instances can be nothing but mere conjectures. Such is the rage at the present time for the restoration of so-called antediluvian animals, that scarcely a bookseller can be found, who will venture to publish any travels, unless set off by the attraction of a frontispiece representing the type of some most extraordinary extinct race of beings, to excite the wonder of the ignorant. In this respect modern travellers may be said to possess a great advantage over their ancestors, for they are not satisfied with merely giving an account of what is to be seen upon the surface of the earth, but appear to consider their task not at all complete unless they can exhume from its bowels a quantity of bones, out of which some outlandish creature is sure to be manufactured on their return home.

An inquiry is next made to ascertain how many of the *Quadrumana* have been discovered in a fossil state, and likewise how many were known to the ancients.

"After having studied and described, as we had proposed, the teeth and skeleton of the three great classes of mammalia, which we have included in the order *Quadrumana*, in individuals belonging to species actually existing on the surface of the earth; we shall next proceed to inquire whether some fragments of fossil bones found in different strata cannot be referred to one or other of these groups.

"The animals which constitute the greatest part of the order *Quadrumana* (*Primates*), or those

which have acquired this appellation on account of their resemblance to the human race, appear to have been observed from the remotest antiquity. But though the ancients were acquainted with a considerable number of different species of apes, particularly after the conquests of Alexander, their knowledge on this point was very imperfect."

The most striking points of resemblance between the human frame and that of some of the Simiæ are well described in the following extract.

"Apes, in extending this title to the order of the Quadrumana, and abstracting some peculiarly anomalous species, offer in the generality of their organisation, externally and internally, so many points of resemblance with the material part of the human species, their principal acts have such a near similitude, that the most civilized, as well as the most ignorant, have admitted an absolute relation between these animals and ourselves. Many philosophers even have imagined they distinguished in the higher orders of apes a degenerated race of human beings; while, according to other, men are only apes in a higher degree of perfection. Others again maintain that men are apes in a state of degeneracy; imitating in this respect the people of Polynesia, who think the ourang-outang is an idle man, who will not talk, to avoid being made to work. That these animals are physically constructed on the same plan as man, is demonstrated by the general form of the trunk, which is much less compressed than it is in quadrupeds; by the head, which is more or less circular, and articulated with the spinal column at a less distance from the posterior extremity of its antero-posterior diameter; by the form and direction of the eyes, of the nose, and of the ears; by the structure of the superior extremities, which are attached to the body at their upper portions only, and which are terminated at their lower ends by a true hand generally furnished with a thumb, that can be moved in opposition to the fingers; by the structure also of the posterior extremities, though they are not so liberally supplied with large muscles, but then their termination in a more perfect hand than is met with in the anterior extremity distinguishes them more forcibly from the human race.

"But the apparent degree of resemblance between apes and men is by no means so striking in all the species which constitute this numerous order; for though there is a vast hiatus between the highest species of the human race and the superior apes, this difference becomes more strongly marked as we descend in the scale."

The higher orders of the Quadrumana cannot support the cold of this country; thus all specimens of the Chimpanzee brought here have in a short period fallen victims to the climate. Their great susceptibility of cold prevents their being generally disseminated over the earth, which constitutes a remarkable feature of distinction between them and the human race. Some species of the Quadrumana, however, can support cold better than others; and it is curious that those most readily affected by it have the greatest resemblance to man. On the other hand, the African, or lowest human variety, is the least capable of supporting cold, and

has the greatest analogy with the Simiæ. The geographical distribution of the Quadrumana is well described in the following passage.

"Another element that can be employed to assist in the resolution of the antiquity of the order Quadrumana (Primates) on the surface of the earth, is that which is afforded by the history of the geographical distribution of the species in general, or certain species in particular, &c. The Quadrumana are now confined to a zone of the globe bounded in the northern hemisphere by the 35° or 36° of latitude in the old world, and by the 23° of latitude in the new world; in the southern hemisphere by the 37° of latitude in the old world, and 27° of latitude in the new; consequently not one species is met with in Europe, in Asia beyond Japan, in North America, in South America beyond Paraguay, in South Asia beyond the Moluccas. They are not known at present to exist in New Guinea perhaps because it has not yet been sufficiently explored, but it is certain there are none in New Holland or in any of the South Sea Islands. The actual state of our knowledge confirms the fact recognised by Buffon, nearly a hundred years ago, that apes and lemurs, properly so called, have never been met with any where but in the old world, or eebi and sloths elsewhere than in the old world. Apes, limited to the old world, and almost to its intertropical regions, exist on all parts of the continent of Africa from north to south, and from east to west, but not in any of its islands. (It is not quite certain, however, whether any exist at Madagascar, though some are said to have been found at Fernando-Po.) A very different distribution is met with in the Asiatic part of the world; for the natural history of apes informs us, that as many species exist in the islands of the Indian Archipelago as on the continent of Asia; from the island of Ceylon in the north to the Moluccas in the south, likewise from Ceylon in the west to the Japan islands in the east. They are only met with on the continent of Asia, from the declivity of the Himalaya mountains at the north to the sea at the south, and from Arabia towards the Red Sea to the frontiers of China. All the species are not met with in all these parts, but different groups are limited to particular districts.

"From this general view of the actual distribution of the Quadrumana on the surface of the earth, it appears that not one species is found in any portion of Europe, even in the most southern parts. Some doubt however hangs over this point, for many travellers of credit declare they have seen the *Pithecius Inuus* at Gibraltar, which is so common on the opposite coast of Africa. If it does exist there, most probably it has been imported, because it is certainly not found in any other part of Spain."

Though human beings stand so pre-eminently above all the rest of the animated creation, yet, to a certain extent, they are influenced by the same circumstances as creatures lowest in the scale. This is particularly seen to be the case in the instance of climate. The account just given of the geographical position of the Quadrumana shows that their abode is limited to particular regions, a peculiarity in which they differ remarkably from the human race. This argument completely negatives the theory

of Monboddo, that man was originally an ape. His adaptation to all climates, contrasted with the obviously limited range of the *Simia* genus, abundantly indicates the nobler and independent range of his powers above the highest imitative animal. Man is able to exist in almost all climates in a stationary condition: in the hyperborean regions, however, where the cold is so very intense, he is in a nomadic or erratic state; because he would be unable to obtain sustenance if he were settled for a length of time in any particular part. The length of his stay is regulated by the means that exist of affording him sustenance, for as soon as the sources for procuring food are exhausted on one spot he moves on to another, where he expects to meet with fresh supplies. The cold is not inimical to the continuation of his existence, so long as he can obtain sufficient nourishment. This is proved to be the case not only in the instance of the Esquimaux, or natural inhabitants of these regions, but likewise with our own intrepid countrymen who have passed several successive years in these parts. The low temperature was easily supported, and the average rate of mortality amongst the crews of the ships sent to explore the arctic regions was scarcely increased. Some constitutions, as might be expected, seemed to be more easily accommodated to the change of climate than others; but there is nothing to show that the cold of the poles is fatal to life, provided a sufficient quantity of wholesome food can be procured. The crews of our ships were dependent on their stores for the means of subsistence, which of course would be exhausted sooner or later; and then, indeed, the cold, rendering it impossible to grow the most important articles of diet upon which we subsist, would, in the first instance, render it impossible to obtain food, and afterwards soon cause the cessation of the vital powers in the individuals themselves; because it would be very difficult for Europeans to endure the privations to which the Esquimaux are exposed, and become accustomed to the kind of food upon which they subsist. The greater and more sudden the transition from heat to cold, and from cold to heat, the more is the constitution tried: people in general have little notion how much the health of sailors is affected in sailing from north to south, and thus passing rapidly from cold latitudes into tropical regions, and then into cold latitudes again. The gradual introduction of steamships, by which the duration of voyages will be greatly curtailed, will have the disadvantage of causing this transition to take place more suddenly, and therefore it will proba-

bly be more injurious than before; at the same time it is to be hoped that better accommodation will be afforded to the seaman than at present, in order that when approaching the equator his berth may be better ventilated, and, on the other hand, when getting into higher latitudes it may be better warmed without being rendered so close as to prevent the free circulation of air. These alterations may be much more easily introduced into steam-ships than sailing vessels; and, therefore, if not made spontaneously by shipowners, their adoption ought to be rendered compulsory by some legislative enactment. Notwithstanding that man appears capable of enduring every climate, and, in this respect, possesses an immense advantage over other animals, still it will be found that some races of men are naturally more capable of supporting the heat of the tropics, others the eternal snows of the polar regions; upon the whole the inhabitants of the temperate regions of the earth are most capable of enduring great variety of climate. The African is the most fitted by his organisation to endure the scorching rays of a tropical sun, and the Esquimaux is most qualified for encountering the freezing blasts of the north; but an interchange of climate between the two would almost infallibly be fatal to both of them. The African, in all probability, would be attacked with a fatal pulmonary affection, and the Esquimaux would soon fall a victim to some fever, so that the power of enduring great change of climate in these races is very limited. The inhabitants of the temperate portions of the earth are most capable of supporting and becoming accustomed to climates different from their own; and it is curious to remark that they include the most intelligent races upon the surface of the globe. Very great extremes of heat and cold are however so fatal to them that they are unable to occupy and spread themselves over the arctic and tropical regions; and these are the only causes which appear to militate against their becoming, in the course of ages, the sole occupiers of the surface of the earth, to the extinction of all the other races. We have in our time the singular fact presented to us of the commencement of such an enormous increase of the great Caucasian race, that they are beginning not only to spread themselves over vast tracts of the globe which are thinly peopled, but to encroach so rapidly upon the natural and savage inhabitants of these tracts, that whole tribes and nations have become extinct, and no doubt in a comparatively short period entire races of them will disappear from the

surface of the earth. At the present time this destruction of the aboriginal inhabitants of the soil is proceeding most rapidly in North America; the continual demand for more land by the thousands of emigrants who arrive every year in that part of the world from Europe, causes the North American Indians to be gradually driven more into the interior of the continent, and they have already receded altogether from the whole tract of country east of the Mississippi. Many of the tribes are unwilling to surrender the lands they have inherited from their fathers without a severe contest, which of course always terminates to the disadvantage of the Indians, and is mostly attended with great destruction of life. These and many other causes, such as the introduction of the small-pox and other diseases, and of spirituous liquors, by their more civilized antagonists, tend to diminish their numbers so rapidly, that not many years will elapse before they must be exterminated, their name being only known in history. The same scenes will in a short time be acted in Australia, now that the tide of emigration has set in so rapidly towards that quarter.

The question next arises, as to what will happen when Australia and the new world are as thickly peopled as the old world? Will their descendants then encroach upon the territories of the inhabitants of tropical regions? No doubt they will; but their increase in these parts, on account of the climate, will not be so rapid, if it take place at all to any great extent, and therefore not so injurious to the aboriginal inhabitants as it is shown to be in the more temperate climates. The conclusions to be drawn from these observations are, that one particular race, in consequence of the superiority of their intellectual powers, has a tendency to spread itself over the surface of the earth, and by so doing, ultimately to cause the destruction of all the other races on account of their inferiority: and no doubt this will be effected in all regions where the climate is sufficiently healthy to admit of the existence and increase of the descendants of the Caucasian variety. Every advance in art and science is favourable to this course, and none will contribute more to it than that great master-piece of mechanical invention, the steam-engine, which will enable its enterprising discoverers to follow their uncivilized brethren into the remotest recesses; the very ocean itself has become the great causeway upon which myriads of human beings will in time be conveyed from one part of the earth to the other, until every nook and corner of it are covered with their offspring. Not only will this gradual but

certain general dissemination of one race of men occasion the destruction of other races of their fellow-creatures, but it will likewise be attended with the extermination of many species of animals, indeed probably of all which are not subservient in some way or other to our wants. To a certain extent this has already occurred in several parts, particularly if the extent of territory be limited, as in our own islands, where many races of animals, wolves for instance, have been almost completely eradicated. The effects of the employment of steam as a motor agent for carriages cannot at present be exactly foreseen, but should it ever be applied successfully to vehicles upon our common roads, which some of our most distinguished engineers declare to be quite practicable, in time most probably those exceedingly common and useful animals, horses, will be destroyed, unless indeed it should hereafter be found desirable to breed them for food, as it is certain they will then no longer be required for the purposes for which they are employed at present. The gradual extinction of whole races of animals, and even of human beings, is then actually going on at this moment, in conformity with the ordinary laws of nature, as we perceive them, and in time the only traces of these beings will consist in their osseous remains which will be buried in the soil. It is clear, then, that races of living beings occasionally become extinct from other causes besides what are called by Geologists the great convulsions which have successively occurred on our planet; but the means of distinguishing the fossil remains of animals which owed their destruction to these convulsions, from those which have been gradually exterminated by the operation of causes similar to those seen to be producing that effect in the present day, have not yet been discovered, and it is not improbable that, as investigations proceed, more races will be discovered to have been exterminated by the same kind of causes as those now in operation, than by great convulsions, though the latter opinion is most generally entertained at present.

A very learned account is next given of the *Quadrupana* known to the ancients, as is proved by their writings, monuments, and other works of art.

“The material traces of the antiquity of apes on the surface of the earth consist of mummies and fossils. It has already been remarked that the Egyptians placed apes among their sacred animals. Notwithstanding, however, that Strabo and other authors of his time have asserted that the *Cynocephalus* and the *Cebus* were considered sacred, the former by the *Hermopolitans*, and the latter by the *Babylonians*, in the neighbourhood of Memphis, I have never been

able to meet with any positive confirmation of his opinion, except in as far as relates to the *Cynocephalus*. Belzoni (*Travels*, ii. p. 15) says, that, in the catacombs of Gurnah, opposite Thebes, he has found mummies of apes in a sitting posture, along with human mummies, which appeared to be *Cynocephali*;* at all events this is certain with respect to one described in another part of the account of his Travels in Egypt."

One of the most remarkable features connected with geology is the great changes that have been continually made in its theories, showing after all that very little of a positive nature is known about it. What can stronger illustrate this than the mutations of opinion on this subject of the author of the *Reliquiæ Diluvianæ*? Another celebrated geologist only requires certain modifications of heat and matter, and he can produce any given number of the Saurian genus. A third says the mistakes of these gentlemen consist in the error of imagining that the Saurian reptiles, and other huge animals, are extinct. According to him, they exist in a huge aqueous cavity in the centre of the earth, and penetrate to us by boring from their domicile. We then only light upon those members of the Saurian genus, it would seem, that belong to the Travellers' Club. Who can avoid laughing at these maddest reveries of pleasant madmen? If they stopped here they would be amusing; but when we perceive them in the pseudo-garb of the philosopher,

"Sapping a solemn creed with solemn sneer," the case becomes widely different. Our trust in the physical truth of the Hebrew Records should become however in no respect impaired by a fleeting system of variable quantities, like geology. Neither do we accede to the ingenious interpretation offered of the first verse of Genesis, since that interpretation, in our notion, would have been devised in a shorter period than 4000 years from the time of publication, and not left to a class of Hebrew scholars, like the present mere plagiarists from ancient writers, few in number, and, excepting Gesenius, of extremely low mental power. The opinion that a successive development of living beings, from the simplest to the most compound, has occurred, is now abandoned by the greater number of the most celebrated geologists of the present day. And yet at one time this doctrine was pretty generally admitted, its plausibility causing it to be readily received, as it appeared very likely that, after each successive convulsion on our

planet, a new race of beings, of a more complicated organisation, should be called into existence, subsequently to the destruction of those of a simpler structure. Further observations have, however, led so far to the modification of this theory, that it seems most likely the characteristics of the new beings were only accommodated to the external circumstances by which they were surrounded, and not that some new races always appeared superior to those which had immediately preceded. The introduction of this modification in some measure prepared the way for the important discovery made within these few years, of the fossil remains of some of the *Quadrumanæ*. No fact can be of more importance in throwing doubts on opinions formerly entertained, because it proves that some of those animals possess greater antiquity than was before admitted, and probably it will at last be discovered that they really were inhabitants of the earth at a period when its condition was previously imagined to be unfit for their existence.

"In the era when the science of organisation was so little advanced, and when, on account of the almost complete dearth of osteological collections, it was nearly impossible for those most conversant with anatomy to establish the smallest relation between fossil bones, without being necessarily led into error. At that period, when no theory existed to explain in the least the manner in which the succession of living beings on the surface of the earth has proceeded, observers were comparatively indifferent about assertions which, in the present day, are obliged to be admitted or rejected, notwithstanding the evidence of facts, and therefore it can be easily understood how many erroneous opinions have been received both with respect to those animals actually occupying our attention, and many others besides, and even to the human race. The first assertion, relating to the existence of a fossil ape, rests upon a complete skeleton of a long-tailed quadruped discovered in 1733 in the metalliferous schist in Thuringia, a representation of which is given by Swedenborg in his *Treatise de Cupro* (tab. ii. p. 168), and who considered it did not belong to a species of *Cercopithecus* or *Cebus*, as Cuvier erroneously stated at p. 7 of his article on fossil crocodiles, but to some marine or amphibious animal, (at this time the term amphibious was generally applied to reptiles,) or to some kind of *Squalus Catulus*. In fact, as Swedenborg imagined, this fossil must have belonged to a marine animal which might or might not have been amphibious; it is therefore clear he never conceived that it could be either an Ape or a Cebus.

"Up to the time of Argenville in 1775, in whose work I indeed imagine this fossil was first described, under the title of 'a tailed quadruped, supposed to have been an ape,' I have never met with any other author on petrifications who has admitted this erroneous relation, &c.

"Hundman says, 'The most extraordinary petrification I possess is the hand of a baboon. It is seven inches long, three broad, as is shown by the figure, which represents it of the natural size. Externally the skin is black and granulated, as is commonly the case in these animals. Anteriorly the fingers and nails are very distinct. Superiorly the nerves are seen protruding. Posteriorly at the side of the carpus, where the fracture has

* There were three unquestionable *Cynocephali* of which our nostrils long retained the odour, in the collection of Egyptian remains brought to this country by Mr. Burton. They were sold by Messrs. Sotheby to the British Museum, the first a young one, for 4*l.*; the second for 7*l.*, and the third for 3*l.* 16*s.*

been made, the bones and marrow can easily be distinguished by their different colours, and so also can the part where the skin has been separated from the muscles.' He adds further, 'that Professor C. G. Fischer, of Königsberg had never met with a similar specimen in any of the cabinets of natural history which he had visited;' and concludes by stating 'he had been offered 100 thalers for it.'

"A third example of fossil bones assigned to an animal of this order, which would be much less likely to become a subject for controversy, at least as far as its anatomical relations are concerned, though the same cannot be said of its fossil state—I allude to the assertion of Imrie on the subject of two crania found by the workmen employed on the fortifications at the upper part of the rock of Gibraltar, and which were at first considered to be human. Dr. Imrie thought they appeared rather to belong to some species of *Simia*, but supposing the former opinion might be entertained by the workmen, which M. Cuvier thought improbable, the differences between the human cranium and that of the *Simia pithecus* being so marked, that scarcely any one could make a mistake of this kind. It appears these crania were really fossil, and found in the osseous breccia of the rock. Indeed the English observer considered they must have belonged to some of the apes that during his time existed on the inaccessible parts of the rock of Gibraltar, and which species, according to some, is to be found there at present.

"M. Fischer de Waldheim, in his '*Paleontologie animale systematique*, p. 132,' doubts whether the skeleton from Guadaloupe, which is considered to be human, might not rather belong to one of the *Quadrumana*;' it is only necessary however to read and consult the description and engraving of this extraordinary fossil by Mr. Koenig, in the *Philosophical Transactions of the Royal Society of London*, to be thoroughly convinced that it belongs to the human species, as I can also state from having had opportunities of examining it in the collections of the British Museum in London. Thus it is certain, that till lately, no authentic traces of the *Simia* had been found in the strata of the earth, not even in the alluvial deposits, which led Cuvier to remark at page 159 on his discourse on the revolutions of the globe, 'No bone or tooth of an ape or Lemur has ever been met with by me during my long researches.' M. Lartet, however, on one hand announced to the '*Academie des Sciences*,' in his letters read at the sittings of 16th January, and 17th April, 1837, that he had just discovered in the neighbourhood of Auch, the fossil remains of an Ape, of a *Cebus*, and of a Lemur: whilst on the other hand, Messrs. Baker and Durand published they had discovered others in some of the tertiary deposits of the Himalaya Mountains. This latter is perhaps less surprising, because that country is still inhabited by some of these animals. The singularity and interest of such an unexpected discovery as that made by M. Lartet, at first threw some doubt over the correctness of his observations; so little was it expected that the bones of *Quadrumana* belonging to Asia and America, would be found to exist in deposits containing the remains of a rhinoceros, *palæotherium*, stag, and the antelope. In fact, it did not seem very unlikely that the most skilful observer, not possessing any means for comparison, except some drawings upon which but little reliance could be placed, might fall into error on this subject. The arrival of a second letter, containing a detailed account of the principal fragment, accompanied with a drawing, ought to have removed all doubt as to the correctness, at all events of a part of what M. Lartet had stated. To prove that it was not only an ape of which he spoke, but likewise a *Simia* Lar. Buff. one of the *Quadrumana* which up to the present time has been found in the islands of the Indian Archipelago only, more than one

hasty sketch was necessary, and also more than one description made without the means of comparison; M. Lartet therefore sent the specimens themselves to me for the Museum of Natural History."

Other specimens of fossil *Quadrumana* have been described by Messrs. Baker and Durand in the 53d number of the *Journal of the Bengal Asiatic Society* for 1836, and by Messrs. Falconer and Cautley.

With respect to the actual state of our knowledge of the antiquity of the *Quadrumana* on the earth, many species of apes are described in the writings of the ancients, from the time of Aristotle, 2000 years ago, and they must have been the same as those existing at present in the countries where they now abound, and fossil remains of the *Quadrumana* have been discovered in different parts of the world, the Ape or *Pithecus* has been found in the old world, the *Cebus* in the new, but the Lemur has not yet been met with at all. Fossil bones belonging to apes have been discovered in countries where those animals still abound, and in Europe where they no longer exist, or at all events only on a very small portion of it."

The discoveries alluded to in the above extracts may be partly referred to geologists in the present day being better acquainted with comparative anatomy than they were formerly, to which branch of knowledge every one should devote himself ardently, who wishes to advance geological investigation. Unfortunately the opportunities in this country for acquiring it are too few, and ought to be multiplied; we would therefore throw out a suggestion to the different geological societies, that they should not only endeavour to get together good geological collections, but likewise add to them museums of comparative anatomy. If this were done, the specimens of fossil bones might be actually compared on the spot with the skeletons of existing species, which would be the best possible exercise for the student.

The satisfactory proof which has been obtained of the existence of fossil remains of apes, shows that these animals have much greater antiquity than was formerly supposed, and overturns the theory generally admitted by geologists, that the *Simia* and man did not appear on the earth till after the last great convulsion to which it is supposed to have been subjected. This discovery of the remains of apes renders it not unlikely that before long, fossil bones of the human skeleton may also be found in some of the earlier strata; should that happen, it will be clear either that the higher orders of animals have existed for a much longer time than was formerly admitted, or else that the age of the world is not near so great as the geologists pretend it to be. There is nothing improbable in this last supposition; for after the occurrence of violent convulsions is admitted, of which geo-

logists speak so confidently in order to account for different phenomena, it is impossible to distinguish accurately all the effects produced by them, from the results proceeding from other causes slower in their operation. Hence the evidence in favour of the opinion that such immense intervals of time have elapsed between each of these convulsions is not perfectly satisfactory. We cannot conclude these remarks without observing that however captivating a study of geology may be, and however vast its import and intimate its connection with other sciences, it must be admitted that at present it is in a most crude and unsatisfactory state, and all attempts at generalisation of its principles should be undertaken with the greatest caution, for if it contain much truth, it is certain it abounds in error also.

The following account of the observations made by M. Lund, a Swedish naturalist, are rather interesting:—

"I ought further to remark, that M. Lund, a Swedish naturalist, who has passed the last five or six years in exploring the Brazils, has discovered between the rivers Rio das Velhas, one of the tributaries of the Rio San Francisco and Rio Paraopeba, numerous caverns, containing bones, in some horizontal layers of secondary lime-stone. The most interesting fact is, that M. Lund, in his letters to the Academie des Sciences this year, announces, that he has recognised among these bones, which abound in the red soil at the bottom of the caverns, fragments of more than sixty-three species of mammiferæ, belonging to forty-three genera, and that in this number there are remains of two species of *Quadrupana*, one a true *Cebus* nearly double the height of the present existing race, of which he has made a distinct species under the name of *Callithrix primævus*; the other much superior in size to the largest *Cebus*, since it is four feet high; and which he thinks belongs to a particular genus, that he proposes to call *Protopithecus*, but he has not detailed its peculiar characteristics.*"

Our limits will not allow of our offering any more observations on the work before us, except to recommend it strongly to the geologist, as one means of assisting him in the acquisition of a knowledge of comparative anatomy, and of a great deal of valuable information relative to those branches of natural history connected with geology: indeed it may be regarded as a sort of digest of the knowledge acquired by its celebrated author on these subjects, during a life of arduous labour.

* From these various examples of the early existence of the *Quadrupana* what becomes of the argument of Charles Bell, *Bridgewater Treatise*, p. 36—"There is indeed every reason to believe that the classes mammalia and birds were not created in an early condition of the earth." The strong evidence we have adduced shows that *Bridgewater Treatises* are by no means infallible, whether from a Kirby, a Bell, or a Buckland.

ART. V.—*Les Français peints par eux-mêmes*. (The French described by themselves.) Paris. 1840.

THE work before us does not describe the French, though drawn by their own hands, for the French of all nations have the least possible intuition into themselves. In point of entertainment from a work of this description, we do not look for that rich and sterling *bonhomme* in them that characterizes the English. They are more subdued in their risible faculties, and certainly are naturally incapable of the force of the English humorist or even caricaturist. All their witticisms excite nothing more than a smile, for it would be injuring "*bienséance*" to indulge in the joyous laugh. The Castilian gravity is formed of high elements of romance, but there is nothing in the Frenchman, save a want of jollity in his nature, to cause this. Strong feeling, beyond the excitement of the moment when they do wax strong indeed, is denied them. The book before us completely illustrates these remarks. We have tried to laugh at it, and are of a laughter-loving mood, but the thing is impossible. The work consists of contributions from the most eminent literary men in the French journals, in the light of surveys for an accurate description of the national character. All their efforts of this description have been failures. In 1786 they attempted a work of similar features to the present production, though confined to the fair sex only, which made its appearance with the following title;—"Les Françaises, ou 34 exemples choisis dans les Mœurs actuelles propres à diriger les Filles, les Femmes, les Epouses et les Mères." Such directions as are conveyed in this work would certainly conduct to anything but its described issue.

On the first essay, *L'Epicier*, we shall only say that it is anything but interesting; and who on such a subject can be interesting? The next, "*La Grisette*," by M. Jules Janin, contains a true picture of the class in question, which is certainly peculiar to Paris. The illustration to this is extremely descriptive of the humble-minded sempstress; but as no persons are likely to feel much interest in the adventures of Jenny the flower-girl, who performs all the offices of lay figures, besides exhibiting herself, in the state of the rival goddesses at Mount Ida, to all young artists, we shall simply give M. Jules Janin a hint that there are subjects on which it is "*peu sage*" to enlighten the public, and on which the less that is said the better. "*L'Etudiant en Droit*" is not badly sketched, and the description of the student composing romances naïf.

"His romances usually begin in this strain—'On a lovely morning of the spring, two men, enveloped in large mantles, silently descended the hill.' Or at intervals he darts thus into the midst of his subject—'By the mass!' said the young unknown, draining at a draught his goblet full of Hungarian wine, 'we live in strange times, my lords.' All his poetry is of the contemplative cast, sickly and rickety, despairing and forlorn, of which style Joseph de Lorme is the especial patron. Interjections such as 'Ah me,' abound in it. His verse is somewhat of the following character:

'Ah me, like him, the doomed of Israel's race,
My sad and solitary course I trace,
With pale and thoughtful brow;
Poison drinks up my blood—struggles are vain,
My heart is broken, to the dregs I drain
Sad misery's chalice now.'

"This strophe terminates in a cloud of smoke and tobacco, and under the influence of a bottle of eau-de-vie. Seeing that the editors and public turn their backs on him, the Student passes to the state of disappointed talent, and traversing the Pont des Arts, measures with a ferocious glance the distance which separates him from the abyss."

But wisely, we presume, considering—

"That he could die
Whenever he would,
But that he could live
But as long as he could,
How grievous soever
The torments might grow,
He scorned to endeavour
To finish it so.
But bold, unconcerned,
At thoughts of the pain,
He calmly returned
To his chambers again."

The follies herein enacted must make most men recall something similar in their own early career, and the marvel is how such silly persons could have been ever endured. The world has certainly more charity than it gets credit for.

"La femme comme il faut." Here the illustration of a person "bien propre" is extremely pleasing, and De Balzac has entered into the pettesses of the toilet with a most delicate and truly Parisian touch. We are supposed to meet the "Femme comme il faut" le soir, having previously seen her le matin, and to be the unconscious spectators of her coquetry.

"The charming deceiver uses little womanish artifices in a manner that excludes all idea of design and forecast. Has she a hand royally beautiful, the sharpest visioned would really believe that it was a matter of absolute necessity to twine, retwine, or divide either her ringlets or curls. If her profile be splendid, it will appear to you that she is giving irony or grace to what she is saying to her neighbours, by placing herself in a manner to produce that magnificent effect of subdued profile so prized by the great masters, which brings the light on the cheek.

"Has she a charming foot, she will throw herself on an ottoman with the coquetry of a cat in the sun, her feet before her, without your discovering from her attitude any thing more than the most delicious model of lassitude that the sculptor could devise. She is the only being easy in her dress, nothing

puts her out. You will never surprise her like a bourgeoisie, replacing her flying gear, pressing down an obstinate busk, or looking to see whether her tucker accomplishes its office of faithful guardianship over its wards, or surveying herself in the glass to ascertain if her dress floats lady-like around her.

"Her toilet is always in keeping with her character, she has had the time to study it, to decide on what becomes her, for she has long since discovered what does not. To be a 'femme comme il faut' it is not necessary to possess information, but it is impossible to be so without much taste."

One more extract from De Balzac's elegant little essay is all we can give.

"We shall no longer see great ladies in France, but there will be for a long time 'des femmes comme il faut' elected by the general voice to the feminine upper house, and who will be to the fair sex in general what the 'gentleman' is in England. See the force of movement. Formerly a woman might have the voice of a fish-woman, a step like a grenadier, a meretricious air, her hair loose at the back, a large foot, thick hand, she was nevertheless a great lady; but *now*, were she a Montmorenci, if the ladies Montmorenci could ever be so, she would never be a 'femme comme il faut.'"

Passing the "Débutant Littéraire" the "Femmes Politiques," the Rabin, which possess nothing remarkable, the "Femme à la Mode" is elegantly written. We extract one little trait of deep and passionate love which is well given. We are to imagine the meeting of two lovers:—"Though alone, they conversed in so low a tone, that one must love to catch those soft and gentle sounds." "La Cour d'Assises" is extremely dull. "La Mère d'Actrice" is well drawn, but we dislike extracting from such revolting pictures of life. "L'Horticulteur" contains some extremely interesting anecdotes of the passion of florists for their beau-idéal, the tulip, which took place about thirty years ago. A single bulb, the Semper Augustus, at that period was sold for 12,000 francs. The Couronne Jaune for 1,123 francs, together with a carriage with a pair of bays, and the Amsterdam newspapers of the time announced "the Admiral Liefhens is in perfect bloom with M. Berghem." An anecdote recounted of the Duchess de Berri exhibits a deplorable specimen of florist cunning. The duchess had succeeded in 1828 in rearing at Rosni rose seedlings, which produced flowers in twelve instances of remarkable beauty. She instructed Madame de la Rochejacquelein to show them to a celebrated florist. After he had examined them minutely, he pronounced three to be decidedly new varieties, and one out of the three, which far surpassed the others, was named the *Hybrid of Rosni*. Two years after, in the month of May or June, 1830, (it was the last time the duchess saw her roses bloom,) she bethought herself that she

had enjoyed for two years the unique felicity of being the sole possessor of *Hybrid of Rosni*, and that it was right others should enjoy a similar pleasure. She accordingly instructed Mad. de la Rochejacquelein to present the celebrated florist with a specimen. Madame de la Rochejacquelein found him reading in the shade of two tall rose-trees loaded with splendid flowers. He received the present with many expressions of gratitude, which this honourable and delicate attention merited. But the benefit arrived too late to be appreciated by him. In the small space of time in which the roses had been in his hands, he had contrived to abstract two eyes from the finest variety. He had grafted them with the greatest success, and received the message of the duchess under the shade of two *hybrids de Rosni*, far more beautiful varieties than any possessed by Madame.

Our next notice will be "Les Duchesses," and a very lively paper the Comte de Courchamps has made, though most amusingly ignorant of our English style and reception of certain parties. The duchess of the "ancien regime" is naturally described as pleasing her fancy with past heraldic glories. Like one English lady, to whose passion in these particulars we always lend indulgent attention, for the lips that speak of the past are unquestionably gifted with a large portion of the beauty of the present, she is invariably occupied with descents in a right line and pedigrees.

"She has got up the full importance and meaning of the bar sinister as well as the eagle without a beak, and the lion without claws, which always indicates, as every one knows, degradation or forfeiture. She disserts considerably on the Napoleon eagle, whose head the revolutionary heralds turned to the left, which makes this contorted bird describe bastardy. On this point it must be owned she triumphs most maliciously."

The description of the hereditary duchess is highly amusing.

"This variety of duchess has usually a species of Anglomania, and is almost always a blue stocking. All her valets are powdered like the postillions of Lonjumeau. He who serves as the valet de chambre is an actual 'groom of the bedchamber.' Her daughters have all English governesses. She will only speak English, though her mother and husband do not understand a word she says. She can only eat giblet soup and *bread sauce*, (how delicately ignorant, for what Englishman eats *bread sauce* alone?)—and her husband, who is an excellent Frenchman, would be very happy to see her eat 'des pigeons à la crapaudine,' or fricasseed fowl now and then; but he can only obtain his melon at the dessert, and to secure domestic comfort is then obliged to eat it with rhubarb." (We hope this is not intended "à l'Anglaise," for we do protest, though somewhat hen-pecked, as most English husbands are, that this dire fate has not yet befallen us.) "They prepare for him daily soup à l'An-

glaise, that is to say—water, pepper and thyme. He groans at his diet, (alas, poor duke!) but does not put himself at all out.

"As soon as she hears by the bell of a visit, she sets to work to read an English newspaper—an immense gazette, and the conversation always turns on the last ball at Almacks, and the abundant dinners of Prince Louis Napoleon. Afterwards they discuss most interestingly the bets on Count D'Orsay's steeple-chase at Sittingbourn, and Epsom cock-fighting. When you are not obliged to listen to the reading of a biographical or literary sketch of Lady Blessington, you must think yourself well off. But do not complain nor breathe the word Anglomania: you will injure yourself irreparably. They assimilate with that expression every possible brutality on your part. Learn also that a young gentleman is of no repute, and considered low, when he is not a member of the Jockey Club at Paris, where it is formally interdicted to converse on any other subject than women and horse-flesh. Do not think I am jesting. It is one of the principal regulations of this agreeable and sprightly association. This prohibition is always affixed in the great room:—If you wish to talk politics or discuss literature, turn out. People established so comfortably and fashionably have not occasion to bother their brains with those matters. The saloons of the Duchess are always filled with English ladies; there is consequently enormous gossiping; and were I not as I am the thirty-third millionary homœopathic particle of the most polished nation in the universe, I would say that in a house filled with English ladies there are always endless disagreeables. When the Duchess in question takes an airing in the Bois de Boulogne, her carriage is carefully furnished with a desk and inkstand, with Perry-pens, *un buvard*, and paper with large vignettes. She is always encumbered with pamphlets and unbound volumes, keepsakes, landscapes, and especially *Quarterly Reviews*. (What a strange thing it is that our lively neighbours can never put us unfortunates into our fair dimensions—and thus murder without any *quarter*.) You must understand that taking in of this review indicates the most exquisite 'fashionability.' (We have to thank the Count for a new word.) And the Right Honourable Lady Blessington has said, where we know not (we are equally ignorant), that the *Quarterly Review* is the ideal of progressive civilisation."

We must, however, protest against this, since Lady Blessington is neither Right Honourable (even in the feminine Council), nor, however her own parties may be attended by some literary men or the *roués* of fashionable life, including, of course, her daughter's husband, the count, the Stanhopes, Lord Lyndhurst, and a few others of the insouciant Melbourne genus, has she any position in good French society, and unquestionably none in England. So far from giving a tone to society, Lady Blessington is viewed only in England as a third-rate *littéraire*, if even that, a *passée* personage, and one to whom English husbands and fathers are unquestionably in no respect disposed to allow the "*pas de société*," and from whom the English matron and "high-born ladye" has ever been, and will, we trust, ever continue to be, totally removed; for not even genius can gild immorality.

In this paper and one entitled "*La Grande Dame*," the sentiments are of the highest conservative tendency, which the following description may serve to indicate:—"She who is now honoured with the appellation of *Grande Dame*, is only a caricature or antithesis of the true '*grande dame*' of the past, a majestic composition, of which all the parts were perfectly in unison, and sealed with a seal of indelible grandeur. Look at the high-born lady of the olden time; how admirably do her features, the air of her head, the general attitude of her body, harmonize and unite in the pure Greek ideal of the gods, to indicate native superiority. There is grace united to grandeur; but to a grandeur that, like the *Farnese Hercules*, feels it unnecessary to crush to maintain its unquestioned position—an assemblage of the noblest elements of choice nature, polished and repolished by time—brilliant transfiguration of a mass of glory accumulated by centuries—inscribed by a hundred generations on all the pages of our history—the high-born lady of the olden time was the blood of all those high barons of France, whose banners for ten centuries were seen in every fight by the side and almost equal to the *Oriflamme*."

As for the *Grande Dame de 1830*, we shall spare her any comparison with the above, and pass to the next, "*Le Médecin*," which is dull. "*La Figurante*" contains nothing worthy of notice. "*La Garde*" is excellent. "*La Sage Femme*" is equally good, and to us it does unquestionably appear among the most monstrous of modern indelicacies to submit females to the offices of accoucheurs. A dangerous case does not occur on an average in any thing like the hundredth instance in medical practice, and here, and here only, is the introduction of the opposite sex needed. The Greeks and Romans contrived to bring their race to their high physical excellence without any aid but women. Socrates, we all know, was a midwife's child, and all are familiar with the beautiful use he made of this circumstance. The Athenian women preferred death to relinquishing the "*Sage Femme*." While under this head we cannot help noticing the fact of the amazing mortality of the *Hospice des Enfants Trouvés*. It is found on an accurate survey, that the instances of the object of this institution, which arrive at a marriageable age, bear the ratio of 1 to 10,000. We presume the writer means that the living bear a proportion to the dead of 1 to 10; for the above is not probable. But this is enormous. Well, if it be the fact, may the writer of this article observe, that an *enfant trouvé* is nearly always an "*enfant perdu*."

Now our *Foundling Hospital* is scarcely a criterion to be depended on; but yet here the mortality among the children is as 1 to 4 on the whole period in which they continue in that establishment. But with respect to the "*Enfants Trouvés*" in France, when we consider that the poor children are leased out to wretched cottagers for 16 centimes a day, the mortality is scarcely wonderful. Furthermore, it is a well-known fact, that the poor children are, in many instances, perfectly naked when received into these asylums; the wretches who are the agents of the exposure seizing the infants' clothes to sell. The mortality among the children at the *Foundling Hospital* in this country was of immense extent during the time that it was the receptacle for these little deserted beings. When we consider the circumstances and mental affliction of the poor mother, this additional enfeebling from cruel exposure, and the subsequent treatment at the foster-mother's, possibly the riddle is read of this immense mortality.

Though we believe that the nature of the *Foundling Hospital* is very imperfectly understood in this country, we cannot but confess that this system appears to partake largely of wholesale murder, and that the present system of its governors in the reception of children may work to a better issue. We believe the following to be a fair statement of the leading object of the *Foundling Hospital*. When a young woman in service, of otherwise good character, becomes seduced under promise of marriage, and appears sincerely sorry for her fault, on the representation of a respectable individual she will generally succeed in getting her child admitted into that institution. And we think if this object were more generally understood, that great benefit might result from it; but, unfortunately, the reverse is the case. We would further suggest the necessary connection of a *Lying-in Hospital*, like "*La Maternité*," with this valuable institution; and if females were employed as midwives, it would answer the double end of an additional mean of support to that sex, together with the improvement of the national delicacy, and assurance of a competent medical skill.

The high accomplishments of the *sage femme* in Paris make her perfectly safe and fit to be entrusted with her delicate and arduous duties. The *sage femme* of *La Maternité* is a prodigy of skill. In this hospital permission is no longer given to the public to enter and inspect it. The supposed reason is, that on one occasion a curious gentleman was inspecting the institution and recognized

his own sister among the patients. These contre-temps are not uncommon in Parisian life.

We purposely abstain from the dark details at which the writer hints, to procure abortion; and we regret to say, that there are in England also many houses which are known and recognised as bearing the convenient character of either l'Hôpital de la Maternité, or even worse usages. We further regret to state, that "L'Hôpital des Enfants Trouvés" is extensively available in this country to many persons, who selfishly get rid of the offspring of crime at the small cost of passing across the Channel their unhappy victims, mothers and children.

"Le Député" forms the next, and with surprise we read the avowal, that in semi-republican France, "on ne fait plus attention qu'aux députés." Notwithstanding all the varied fortunes which France has undergone, her elective constituency is extremely small, the total number of electors amounting simply to 170,000. To this, and to the entirety of her constituency, may be ascribed the respectability of the deputies; for certainly no person in his senses would dream of describing a member of our lower house as commanding any position in society. Who regards Wakley, Warburton, Hawes, and the O'Connells, as persons fit to introduce even into middling society; if from no personal peccadilloes, they are barred out from their inbred vulgarity. The O'Connells, for example, at a party given by the member for Tipperary, smoked cigars and drank whiskey in a drawing-room filled with ladies, toasting "King Dan," and adding to their repulsive natural vulgarity and broad Irish blarney, this precious addition from their own smoke-dried "cabanes." Nothing but the House of Peers supports the entire legislature of the country from sinking into as bas-ton as a meeting of the Common Council or their constituency the Worshipful Lumber Troop. We trust Lord Stanley will at least clear out that Augean sty on the next general election; for the Irish tail is unquestionably, in point of rank, "La Coda dell'uni-verso."

"The Canoness" is elegantly written, and certainly this class forms a singular species of the society nun. But if any further illustration were needed of the extreme folly of the celibacy system, this small body would furnish it. Here are women neither spinsters, wives, nor widows, and yet, some say, exercising the several functions of all at times. Having taken the veil, but yet unveiled to all beholders;—with oratories in which they do not pray—with confessors, and yet not repentant—with lovers, and yet

affecting to renounce them. The Canoness is an hermaphrodite; one party will not have her because she is a *religieuse*, the other because she is not *religieuse*. She is not admitted among virtuous women, because her manners are too free; she is repulsed by persons of easy virtue as prudish. The devout look on her as an ungowned priest, others reproach her for being too deep with gownsmen. An antithesis to social life, a compound of opposites, a victim to an evil monkish system.

We pass on to the "Joueur d'Echecs." Here we cannot but think that the French have very unfairly assumed far more merit than they possess. Deschappelles has certainly evinced no disposition to encounter the English challenge; and we feel quite assured that Lewis would beat him if a match were undertaken, means being also adopted to enable him to give up his powers entirely to the consideration of the game, from his present important avocations as an actuary to one of our insurance offices; and were Macdonnell living, no person now in force as a chess-player could equal him in the blind game. One instance of the extreme conceit of Deschappelles shows him any thing but infallible. He had given a challenge to several distinguished English chess-players, to beat them at the blind game. Lewis was in the room: Deschappelles sat down to whist, and called the moves from the whist-table. On one occasion he requested Lewis, who was not playing, to make a move for him; Lewis did so, and instantly told him he had lost the game. Deschappelles jumped from his seat, and declared it was impossible, but the anticipated result ensued. Amid the adventurous knights who have joined Sir Palamedes in his noble game, few have attained the renown of Boy, the Syracusan. He fought Charles the Fifth, and vanquished him. Don John of Austria, the victor at Lepanto, fell beneath his hand; and this latter warrior ordered sixty-four squares of white and black marble to be formed, placing living men on them, and played the martial game with his conqueror repeatedly, each issuing his respective orders to his living men. Nor was Boy less successful in beating popes as well as kings, for Paul III. offered him a cardinal's hat, after being gloriously mated by him in the thronged Vatican. And what is more, the beautiful and pallid flower of Venice, the ward of the aged Barberigo, an enthusiast in the game, and who confined the Lady Erminia, from selfish jealousy, after a few lessons from Boy, so profited by the last that she gave *check-mate*, by her departure with him, to

the aged senator. All lovers of the game have before them Charles the Twelfth, playing his own king-like game, moving the king, however faulty, from his own natural vivacity, and losing all in this trait of character so natural to the King of Sweden. How many a gallant story connected with this game do the Eastern annals tell—of pearls of Caucasus, lights of the dim Serai passing into the possession of the successful combatant, unfolding to his moves far brighter charms than unexplored Golconda, or the dark caverns of the pearl-encircled Ceylon.

Who can forget the shriek of Zaloue from the curtain that enshrined her, when one fatal move was about to consign her from the arms of the son of Mahomet to his vizir. The whole history of chess, to say nothing of the delicious aid it lends to lovers' declarations, or the delight of appropriating to oneself a charming woman—a sweeter study than even the enchanted pieces before us—for many an hour in this most enviable "tête-à-tête," unnoticed under this pretext, both protected by the "genius loci" from all interruption or observation, save of each other—assuredly chess has recommendations such as no other source of amusement or recreation can minister. "La Maitresse de Table d'Hôte," "Le Chasseur," "La Femme de Chambre," and "L'Ami des Artistes," are not remarkable. We hate cheap dinners. The Chasseur never seems to us to possess half the character of the English sportsman, and is a much more ordinary personage. The Femme de Chambre is certainly a personage of pretension; but for L'Ami des Artistes, the whole French public is fortunately an artistic public. We have instances of splendidly munificent noblemen, as the late Lord Egremont, to whom artists should have joined in some general effort to transmit their sense of this high feeling for art. One anecdote of this amiable nobleman, for the accuracy of which we can vouch, may illustrate the character of L'Ami des Artistes. An artist had just completed the portrait of his niece, Miss Wyndham, and had succeeded, as that artist always did, in giving a lovely picture of what was really lovely, and Lord Egremont instantly prepared to settle all matters relative to the picture, expressing his entire satisfaction in the work. The artist expected to receive his ordinary terms; and the public may easily imagine the delight as well as the charming sensation of the delicate manner in which it was done, when on looking at the cheque he perceived that the amount was for 1000*l*. Possibly also his twelve children did not diminish his sense of the delicate kindness of Lord Egremont.

Here then it would appear, with respect to one branch of the fine arts, that the artiste lives by L'Ami des Artistes. But the reverse, it would seem, is the case with respect to one branch of art, the drama, in Paris. When Duchesnois died, a person met an old man who was one of her most intimate friends. He was pale, confused, awe-stricken. Every one was trying to console him; but in vain. "Her loss," he exclaimed, "does not affect me so much as her horrible ingratitude. Would you believe it; she died without leaving me any thing in her will—I who have *dined with her at her own house three times a week for thirty years*." "La Femme sans Nom" shall remain unnamed, unnoticed.

But who can tell how far nations have sinned in not providing a remedy for this evil of evils? How completely is Woman thrown out of the scale of employment, and how often do we hear of every effort made to preserve themselves from fast closing evil! The spirit in which "La femme sans Nom" is written does high honour to the philanthropic author, Taxile Delord. How many are there like his degraded heroine; and what but principles infused deep in early life into practice, a living portrait-ure of the "savoir vivre," can prevent their still further increase. Principles of high character which may ennoble the physical, elevate the moral, and awake the religious portion of her being. For with respect to the physical (except in nymphomania) she is less incited than the opposite sex; and she looks down from her position deliberately on the gulf at her feet, and all her spiritual energies can therefore be easily roused. Were she higher educated in education's noblest sense, higher principled, different results would, we are convinced, follow; for from the abstract literary woman we fly with the same horror as "La Femme sans Nom." Hemans even, we have been informed; though perfectly amiable and unexceptionable, was a person with whom few husbands could live, and totally unfitted to superintend her household. The fitting education which puts forth the duties of life in their right position, that developes their utility *here*, their consequence *hereafter*, that forms woman for healthy practical energy, that indicates the weakness of the cloister, and of those silly devotees now becoming so common in England, personal religionists, a foul affinity to a spiritual species of "Femmes sans Nom;"—this is what is requisite to produce a woman of whom it may be simply said, "Domi mansit, lanam fecit," but who has included with these fitting properties of her sex all the glorious, the un-

seen lights of the pure and noiseless duties of the matron.

"La Jeune Fille" contains some lines approaching to prettiness, but nothing further; the conclusion, which we translate, is evidently borrowed from Goldsmith's "Edwin and Angelina:"

"And what is youth? a meteor light,
A day fast breaking forth from night;
Whose azure fades by time's foul power,
A lightning flash mid waters lost,
Presaging to the passion tost,
Ruin in later hour."

The poverty of the stock of physical objects of the writer is clearly indicated in the above extract, in which a meteor and lightning are both applied in illustration of the same image. The French will never write poetry, their language denies them the power, and they have never attained any higher elevation than the "platitudes" of Akenside or Rogers.

"Le Pair de France." There is very little general interest in this paper and the next, "L'Elève du Conservatoire." It is, however, "en passant," rather remarkable that the French House of Peers has gained by the Revolution. Before 1789 Dukes and Peers had no political power in France, and Louis XVIII. first raised them into a third estate. The revolution of July confirmed his decree; but in 1830 the Bench of Bishops all vanished, and only one spiritual peer was present at that day of rule of the sovereign people—the Abbé Montesquiou. He entered the chamber with his hair powdered, dressed in black, took the oath in a low tone, sat a moment, not far from the ministerial side, then quitted it without ever returning; and with him vanished the solitary exemplar of the priest, legislator and judge. We may further add that in France the number of peers is unlimited, and the peerage now not hereditary. Two fatal blows to the aristocracy, which will prevent while they continue in force any thing like the independence of the British House. With respect, however, to the first, even the present ministry dare not attempt any addition or encroachment; and never in the wildest vagaries of imagination dreamt of essaying the second.

Our old acquaintance, the inimitable French postillion, forms the subject of a very spirited paper, and "La Nourrice sur Place," but the poor foster-mother we fear is harshly dealt with. But in England we have very few comparatively with France, where they form a large class, and their mothers actually reckon their services in these points as so much dower to their husbands. "L'Employé," "L'Ame méconnue"—both

these pieces are excellent in their way. "L'Ecclesiastique:" this contains some sadly morbid and distorted views of Christianity. To class Protestantism, philosophy and indifference among the enemies of Catholicism, and as only known for the bad passions innate in the three, is so utterly absurd that we stop not to refute it. Protestants of all religious denominations form unquestionably the one that adheres with the greatest zeal to fixed expressions of opinion. They have no identity with the pseudo-rationalists, though just appreciators of reason. So far are they from favouring indifferentism or philosophic scepticism, that they bind themselves into the strictest adherence to their articles, and view nothing as an article of faith that has not its sanction in the Bible, and though attached to pure philosophy, yet they hold this as not contradictory of their holy faith, but the closest moral assimilation to it, for no one can deny that the Aristotelian Ethics, or the Dialogues of Plato contain strong affinities in moral likeness to the Christian faith, although they may fail in its high and ennobling sanctions to holiness, or in its earnest of futurity.

What has sunk the Roman Catholic ascendancy every where but its dangerous and treasonable tendency? what has debased its ministry but their tenacious adherence to error, with the same pertinacity as truth, that still distinguishes it? what has rendered persons distrustful of their ministrations but the open vice and the dangerous access to their homes of a priesthood of avowed celibacy, even when endued with strong religious feeling, still human in passion, and if not so, causing just apprehension of exciting an abstract devotee spirit amid their females? The revenue assigned to the Church in France scarcely gives even the average of 50*l.* per annum for each of the 30,000 priests, and does not allow of more than one priest to a thousand souls. In England also, the destitution, though not so great, is sadly to be deplored, for of the total number of English benefices, 10,478, 4000 nearly are under 200*l.* per annum, and upwards of 9000 under 500*l.* per annum, a state of things that calls loudly for some alteration, and which all the specious reasoning of Sidney Smith, a reformer *out* of place, a stickler for the "status quo" when *in*, contemptible as a disputant, mighty only as a jester, scurrilous as Swift, without his talent—cannot uphold. The cathedral preferments must, under this state of things, unless six millions be voted to Sir Robert Inglis, be applied to raising the value of small benefices, and twelve respectable parish priests with 300*l.* a year

each will do more good in their generation than a legion of Sidney Smiths sitting in cathedrals and doling out their modicums of wisdom to their few stray hearers. The commissioners for building new churches aided to some extent this desirable end; but their power is sadly limited, their means of endowment too small, and certainly it is high time that England should be divided into ecclesiastical districts, with efficient superintendence. The parish in which these observations are penned consists of 40,000 souls. The rector has a clear income of nearly 2000*l.* per annum. Now is this income to be treated as *his*, or his for *certain uses*. We think the last, and that he should be compelled to provide for the spiritual necessities of the people at some personal sacrifice, but this he refuses to do. Under these circumstances, we conceive that he ought to be forced to provide for the increased spiritual exigencies, or to resign his preferment, since he does not discharge the condition under which he holds. For as his income has increased by population, so ought he to provide against the exigencies of the population.

We do not say to a ruinous extent, but all these large incomes, of which there are not 200 in the entire country, certainly ought to be made more available. They are but few—but still ought to be better applied; 134 of 1000*l.* and under 1500*l.*; 32 of 1500*l.*; and under 2000*l.*; 18 of 2000, and upwards. Stanhope is 4843*l.*; Doddington, 7306*l.* The population of the first is only 4800, of the second 7527; the united population nearly equalling united income. Now let us look at what the income from these two livings properly diffused could effect. It would supply forty parishes each with a minister, possessing 300*l.* per annum. This may have too utilitarian an aspect, we admit. The church property we are also prepared to show is inalienable from church uses, but ought to be applied to them in the most available form. Existing rights should be respected as far as this, that if the Government were to make a new distribution, it ought to indemnify present occupants. Giving, for example, to the patron a fair number of years' purchase, but still requiring incumbents of large incomes to make suitable provisions for the edification of the people. No man when he takes a large parish ought to consider himself the unquestionable possessor of it as a nobleman is of his estate. The law, as it at present stands, and the principles of church extension have been so well understood during the last ten years, that it is idle to plead ignorance, and it is shameful to trace a

clergyman simply occupied in his own aggrandizement, quietly suffering the people to be demoralized and his labouring brethren around him wholly unsupported, and having recourse to every exertion for the bare means of subsistence. The world may do so, but surely the Church should be *self-sacrificing*. The priest of the Romish communion repeatedly makes vows of poverty and celibacy; is it too much to demand of the son of the true Church, of the reason-illuminated Protestant, of the great grasper of the system of Christ in all its purity and vigour, that he should submit to the deprivation of a few luxuries in order that his brethren may be possessed with even means of livelihood.

We shall here terminate our notice of Les Français, which, as a whole, is extremely feeble when viewed as a delineation of national character. The idea was well conceived, but the execution is not equal to the original conception. It does not describe the French as a people, and writers of a higher power than a few sparkling essayists are requisite to give us the living form and image of the time. Still is there much well conceived and fairly expressed; but the illustrations want the power of our Cruikshank, and though good in some instances are feeble in general character. We cannot say that the French ladies owe their designers much gratitude. There really is not a single pretty face in the entire work, which is a leading defect, and very apparent to English eyes familiarized to home loveliness, and its beautiful and highly finished portraiture from the burin.

We trust some future Bayard, "*sans peur et sans reproche*," will exhibit, for the honour of France, demoiselles at least as remarkable for their native beauties as for their artificial tournure, and that *the lady* will appear equally characterized by face as well as fashion; the first being nature's aristocracy, the second art's, and of easily attainable resemblance. We cannot conclude, however, without stating our satisfaction at the improved moral tone of most of the essayists, and the kindly spirit to our country and obvious study of some branches of English literature, which they evince. We trust that this will increase between us; both may be benefited by it, we are fully convinced; and the interest of the two leading powers in civilisation being closely united, we are satisfied that we could bide the buffet of the world; for that which England has done singly, it is not Quixotism to anticipate she may again do conjointly with France, her most powerful ancient foe becoming her strongest friend.

All enlightened views of a higher policy

than has hitherto been adopted proceed from France and England. The influence of the former opened even the foul dungeons of Spielberg, and the sight of a British man-of-war soon brings even the Neapolitan to his senses. Italy may yet claim a little further British attention, and it is deeply to be regretted that on the termination of the war some of her states were not freed from Austrian despotism. France has long kept her eye upon Piedmont, but any attempt at occupancy there would be useless and ungenerous. Neither power requires increase of territory. What has France gained by Algiers? But each should assuredly look to the independence of Italy as forming the strongest barrier against the despotism of Vienna and Russia, who is touching on her confines through her agent the nominal sovereign of Greece. It is mighty to conquer: it is mightier far to raise the conquered in strain and character.

ART. VI.—1. *Italien. Beiträge zur kenntniss dieses Landes*, von Friedrich von Raumer. (Raumer's Italy.) 2 vols. Leipzig.

2. *Papers relative to the Sulphur Monopoly in Sicily. Presented to both Houses of Parliament by Command of her Majesty.*

PROFESSOR VON RAUMER went to Italy about the middle of last year, to examine the archives of the principal cities of that land of ancient associations, with a view to the completion of some important historical works on which he was engaged. He carried with him the most powerful recommendations from his own government; and on his way through Vienna, he had the good fortune to obtain from Prince Metternich personal introductions to most of the principal public functionaries, not only in the Austrian states, but in those likewise that by courtesy are called independent. He had access, in consequence, to official information of various kinds, that from all travellers before him had been most religiously concealed; and while diligently exploring the annals of former times, he became acquainted with a multitude of statistical and municipal details respecting the present condition of the country, which he has put together into two moderately sized volumes, that will be read with interest by all those who take delight in inquiring into the causes of the general welfare of large communities.

Some of his friends appear to have thought that these statistical notices would be deemed

tedious by the majority of readers; and in deference to this opinion, he has interwoven into his work a kind of personal narrative of his journey. We are by no means certain that he has acted judiciously in doing so. The instructive portion of his volumes we are disposed to look on as by far the most amusing part; and it is only where the worthy professor attempts to be playful, that we have found him a dull companion. He has arranged matters, however, in such a manner, that those who wish only to amuse themselves with the usual chit-chat of tourists, may be spared the details of a more serious kind; for the work is written in letters, and it is easy for the reader, on coming to a new letter, to know, at the first glance, whether it is the author's intention to be in a playful or in a grave mood.

Professor von Raumer is what is called a liberal in politics; yet from the beginning to the end of his work, he is an apologist of the Austrian government, and an unsparing censor of all those who look back with regret to the days when the French held sway in Italy. This is something new. Liberalism in Italy has so long been wont to go hand in hand with Gallomania, and so rarely has a voice been raised in justification of Metternich's government, that when a professed liberal comes forward, to show that at no period during the last eight centuries has Italy been so happy, so prosperous, or so well governed as at present, the novelty of the position can scarcely fail to command our attention, more particularly when we find it supported by the sturdy and unanswerable rhetoric of statistical details.

We are disposed to believe with M. von Raumer, that the Austrian sway in Italy has not in general been fairly judged. Most of the accounts hitherto published have proceeded from the pens of political refugees, or of French enthusiasts of the Napoleon school. Our English travellers have, with few exceptions, visited Italy with preconceived notions, which they have wanted time and opportunity to correct; for in countries where the press is entirely enslaved, and publicity of every kind is carefully avoided by those in power, it requires a longer residence to enable a stranger to judge with accuracy of political institutions, than in those where the strongest light is thrown upon every public question by free inquiry and unrestricted discussion. If, however, the Italian administration of Metternich has not been fairly judged, it is his own policy that is chiefly to blame. His morbid apprehension of every thing approaching to the expression of public opinion has not imposed silence on his enemies in France and England, but it has prevented

those who alone were qualified to advocate his measures from entering the literary arena ; and the consequence has been, that while the vices of his government have been studiously held up to public reprobation, little or nothing has been made known of the many redeeming characteristics by which the despotism of Austria has all along been modified.

While, however, we are willing to believe, with the worthy professor, that the Austrian system of government in Italy is not so bad by any means as it has generally been painted, yet we are far from admitting the force of those facts and arguments by which he endeavours to prove it to be the best and most unobjectionable which the lovely peninsula has known, since the day when the stranger first began to exercise his rule. With all the vices inseparable from the aristocracies of Venice and Genoa, we believe that both cities, as well as their dependent territories, had they been restored to independence at the general peace, would have derived greater advantages from five-and-twenty years of uninterrupted tranquillity, than have fallen to their lot while under the sceptre of foreign sovereigns. Mr. von Raumer is not perhaps himself aware of the extent to which his political judgment has been influenced by the urbanity of prince Metternich's reception, and by the courteous treatment which the prince's introductions every where secured to their bearer. Perhaps also the extravagant libels heaped on the Austrian government by the liberals of France may have stimulated the professor, in the warmth of his zeal, to rush into the opposite extreme. Hence, we presume, arises his apparent oblivion of the fact, that Italy has been for five-and-twenty years at peace. It is, we believe, to the duration of so inestimable a blessing, rather than to the profound wisdom of the Austrian administration, that many of those improvements in the social condition of the country, for the truth of which we are quite willing to take his word, are mainly to be attributed.

From the preceding remarks, our readers will perceive, that it is only with certain limitations we adopt the views of our author. His facts, we have no doubt, are correct ; indeed, in most instances, they are derived from official sources ; but in the inferences that he draws from them, he allows himself to be carried away by his admiration of the man, whom he repeatedly proclaims as " the first statesman of the day." With this warning to put them on their guard, our readers may safely adopt the professor as a guide. He will be found an amusing and instructive companion, and the information which he has

it in his power to communicate, is exactly that which we seek for in vain from all preceding writers on Italy.

No part of Italy suffered more from French domination, none has prospered more since its reunion with the Austrian monarchy, than Trieste. In four years of French occupation (from 1808 to 1812) the number of inhabitants dwindled from 40,000 to 20,000 ; at present it exceeds 54,000, and the high price of labour is a satisfactory proof, that though there be an increasing there is certainly no redundant population. In this, however, there is nothing surprising. Trieste, it must be remembered, was not annexed to the dominions of Austria by conquest, but by a spontaneous act of the citizens themselves. In 1382 the little republic placed itself of its own accord under the protection of the more powerful state, and stipulated at the time for certain rights and privileges, which have never been infringed upon by the emperors, except by mutual consent. In 1717, under Charles VI., a most important modification occurred in the municipal government of Trieste ; the city abandoned a part of its privileges, in consideration of its being constituted a free port, and thus became the great maritime emporium for the Austrian monarchy.

The usual consequence of an unshackled trade ensued. In about forty years, the population, which in 1717 had amounted only to 5600, increased to 20,000, and in 1804 was computed at 40,000. Nor was commercial freedom the only privilege which the inhabitants of Trieste enjoyed and still enjoy. They are liable to no taxes but those imposed by themselves, a moderate fixed sum, annually paid into the imperial treasury, constituting the whole extent of their fiscal liability to the state. They are free moreover from the conscription, and exempt from having troops quartered upon them. All these local privileges were suspended during the period of French occupation, and the continental system of Napoleon annihilated the whole commerce of the place. On the expulsion of the French, the privileges of Trieste were to a great extent restored. The annual contribution to the Austrian treasury was indeed augmented from 16,000 florins to 500,000 florins ; but the important immunities of the free port, and the exemption of the inhabitants from state taxation and military liability, were restored in their full force, and the natural consequence has been a rapid and still advancing career of prosperity.

Such has not been the fate of Venice. It is difficult to imagine a more striking contrast than that which the activity of Trieste

presents to the listless apathy of the dis-crowned Queen of the Waters. Mr. von Raumer finds consolation in the belief that the further decay of Venice has been arrested, and that the measures of Austria have at least succeeded in making the population stationary; but in what condition do we find that population? Of 100,000 inhabitants, no less than 52,443 in the regular receipt of eleemosynary relief! More than half the population supported by public charity, and no less than 800 patricians subsisting on a miserable pittance doled out by a foreign master! Professor von Raumer hints a belief, that the immense sums thus expended in public charity may be among the main causes of the wretchedness of Venice.

Our author no sooner quits the Austrian territory than he assumes the censor, an office, however, which he exercises with exemplary moderation. He sees much, indeed, to disapprove of in the administration of the Sardinian dominions, and assuredly the facts that he states would have justified a much severer tone of condemnation. In no part of Italy does the intolerant spirit of popery manifest itself in so odious a form as in Piedmont. The Protestant Waldenses are no longer hunted like wild beasts through their valleys by fanatical zealots, nor forced to wander away by hundreds and thousands to seek an asylum and a resting place in the most remote parts of Europe; but persecution is not the less active against them, though persecution has assumed, in some measure, the milder form of contumely and political disqualification. The Protestants of Piedmont are shut up within their valleys, and are not allowed to add by purchase to their real property. A natural child is to be taken away from the mother, that it may be reared in the Catholic faith; and this, though the father should declare himself willing to marry her; nay, the Catholic priest is authorized by law to withdraw from their parents' care even legitimate children, as soon as these declare their willingness to be converted to the Roman faith; and to make such a declaration, a boy is considered sufficiently old at twelve, and a girl at eleven. "The means employed for the attainment of such a declaration," observes Raumer, "are never disapproved of; on the contrary, the seducers, if successful, are always considered to have performed a meritorious act."

A considerable portion of Raumer's work is taken up by a minute account of the schools and universities of Italy, and we must own we were not prepared to find that so much had been done and was still doing

for public education, as appears to have been effected in Venetian Lombardy. A complete system of national education has been established, with the regular gradation of elementary, commercial, and classical schools, all maintained at the cost of the state; and already, in 1837, there were 4531 elementary schools (including 726 private establishments), and only 66 communes remained unprovided. The expenditure for these elementary schools amounted in 1837 to the sum of 507,000 florins. Of this, 21,000 florins were derived from private endowments, 423,000 florins were contributed by the communes, and 63,000 florins by the state. The efforts of the government have not, however, been everywhere seconded by the people; for two-fifths of the children of Lombardy, it is calculated, are allowed to neglect the advantages thus provided for them by the state, although the instruction at these schools is entirely gratuitous, the only expense to which the parents are subjected, being the purchase of books.

In the Sardinian states the government has done less for education; and the schools that have been established are completely under the control of the popish clergy, who occupy nearly the whole of the school hours in religious exercises.

In the South of Italy, in the Roman and Neapolitan dominions, little or nothing has yet been done for public instruction. During the French occupation, a multitude of brilliant plans were committed to paper, but never assumed a more substantial form.

Few countries in the world are more advantageously situated than Naples and Sicily for the attainment of a high degree of commercial and social prosperity; and should a rational system of government ever find its way into that part of the world, it is difficult to calculate the political importance to which the Neapolitan monarchy might rise. Unfortunately, however, the legislation and state policy of that kingdom are the most perfect model that can well be imagined of what a prudent government ought to shun and condemn. The corn laws of the country, instead of protecting agriculture, appear to have been enacted for the express purpose of discouraging production, and a recent act—we allude to the sulphur monopoly, of which so much has lately been said and written—affords unquestionably the most unique specimen of political imbecility, with which any European government has ventured to astonish the world during the last twenty years. As this is a subject that has of late occupied a very considerable share of public attention, we shall devote to it the greater part of the present article, and this

we shall do the more willingly, as our English readers will soon have abundant opportunities of judging of the general value of Professor von Raumer's work, of which a translation has been announced as on the eve of publication.

"You remember, no doubt," writes our author in one of his letters, "how it was customary in our younger days to put into the hands of schoolboys certain Latin compositions, into which were crowded all imaginable violations of grammar and syntax, by correcting which the student was to learn how Latin ought *not* to be written. The same plan appears to have been acted on in Naples respecting the sulphur trade. The late laws and ordinances on this subject are admirably calculated to show how, according to the dictates of sound policy, matters of this kind ought not to be treated. The compact between the government and the Taix company more particularly is such a *monstrum horrendum, ingens, cui lumen ademptum*, that it will be difficult to find its parallel in the modern financial history of Europe."

Professor von Raumer views the question simply as one affecting the interests of Sicily, which have been sold by the king and those about him to a private company for a pecuniary bribe. In England we are bound to consider it chiefly as an attack on the rights and immunities guaranteed to British merchants by the commercial treaty of 1816. Our German laughs at the folly, our business is to protest against the knavery, of the act.

Sulphur constitutes the most important article of exportation from Sicily, since the corn-trade, the ancient source of wealth to the island, has been destroyed by the folly of its rulers. Some years ago, in consequence of over speculation, a reaction took place, that led to a great depression in the price of sulphur. As is usual on such occasions, the producers, instead of considering whether they might not themselves have been in a great measure the cause of such a state of things, began to grumble, and to call on their government to do something to raise prices and increase profits, as if government regulations, and not the balance between supply and demand, could fix the price at which merchandise should be bought and sold.

"Certain interested individuals," continues von Raumer, "took advantage of this popular delusion, and one Monsieur Taix handed in a grand plan for the relief of the said producers. Undismayed by the rejection of this plan, on its being submitted to a Sicilian deputation, Monsieur Aycard came forward with a second, and afterwards with a third, in which it was declared to be exceedingly foolish to allow the proprietors of sulphur mines to exhaust them by excessive working, and that the state must interfere to control private interest, and dissipate 'the idle dream of a free trade.' The monopoly of sulphur, it was added, was one with which Nature herself had endowed the island, but which it was

necessary to maintain and secure against foreigners. It would be better for Sicily to produce *little* sulphur, and to obtain for that little *much* money. By means of a privileged commercial company alone could so desirable an end be attained; and accordingly Messrs. Taix, Aycard and Co., out of pure magnanimity, agreed to take the arduous task upon themselves, undertaking at the same time to make roads, distribute alms, indemnify mine owners, and establish a mineralogical cabinet in Palermo! Arguments of this kind imposed upon many simple-minded individuals; *other means were employed to gain over other persons*; an investigation in full council was carefully avoided; and the conduct of the whole affair was entrusted chiefly to *one* minister."

The learned professor goes on, at considerable length, to show the disastrous consequences which must ensue to Sicily herself from the adoption of this preposterous specimen of petty tyranny, which we believe the king himself most heartily repents of, and which, in the end, will probably turn out to be a losing speculation to all concerned, with the exception only of those who have pocketed the bribes for which they sold themselves and their country to the monopolists.

The first mistake of his Neapolitan majesty was to suppose that nature had really endowed Sicily with the exclusive privilege of supplying the world with sulphur. This mineral is found in the vicinity of almost all great volcanoes, and may be obtained in great abundance from Iceland, Teneriffe, Java, &c. If Sicily has hitherto enjoyed an almost exclusive trade in sulphur, the island stands indebted for the advantage, in a great measure, to commercial habit. When a country once obtains possession of any particular branch of trade, the advantage is rarely lost, except by some great legislative blunder. Sicily might have gone on providing the manufacturers of England and France with sulphur for centuries to come; but should the new policy of shortening the supply be persevered in, new mines will be opened elsewhere to make good the deficiency, and the end will be the entire destruction of almost the only remaining trade of that much mis-governed island. As the real history of this question may be new to the majority of our readers, we will give a short sketch of its biography, and for this purpose we will take our facts chiefly from the letters of the Sicilian ministers themselves, as given in the papers recently laid before both Houses of Parliament by her majesty's command.

It was in the year 1836 the rumour first got abroad in Sicily, that a company was to be established, which should have the sole right of purchasing, at fixed prices, whatever sulphur might be produced within the island. This company, it was added, was to have the

exclusive privilege of exporting that mineral, whether in a raw or refined state; and this patent right was to continue for ten years, on condition that the patentees expended £10,000 a year in the constructing of roads, besides paying £500 a year to a newly established workhouse.

The British merchants were seriously alarmed at this report, and not without good reason. The way in which this trade is generally carried on, is by undertaking to furnish a given quantity of sulphur on a given day at a certain price, and this practice has been recognized as legal by the Neapolitan tribunals, which strictly enforce the performance of such bargains. At the time the rumour first got abroad, that the monopoly was about to be established, the English houses in Sicily and Naples were under contract for the delivery of large quantities of sulphur, at twelve and eighteen months after date. The terms of these contracts always are, that the seller is to put it at his risk and charge on board of the buyer's vessel, and give over to the said buyer the usual custom-house pass for the sulphur. The Italian formula, which is extremely clear on this head, says:—" *Spediti dalli venditori per fuori regno alla vela fino in barca grande, con licenza d'imbarco alle mani, e franchi di qualunque spesa alli compratori.*" It frequently happens, moreover, that parties in England or France forward orders to Sicily to purchase sulphur at a certain price (calculated in pounds sterling or francs) free on board, with instructions not to charter a vessel, as care will be taken to send one out from England or France. It requires only a moment's consideration, to feel that merchants under heavy contracts of this nature could expect nothing less than complete ruin from a sudden augmentation in the price of sulphur, occasioned by the establishment of a privileged company, who would have it in their power to impose what terms they pleased upon those under the necessity of buying.

The second cause of apprehension to the British merchants in Sicily was of a different character. A number of them had become lessees of sulphur mines under very peculiar circumstances. It appears that, somewhere about the year 1835, Mr. W. J. Craig, from Glasgow, visited Sicily, and made a tour through its mining districts, where he convinced himself that some of the large sulphur mines which were under water might be drained by the aid of improved pumps worked by steam, and be again rendered productive and profitable to their owners. For undertakings of such magnitude, how-

ever, the capital was not to be found in Sicily. Mr. Craig, therefore, on his return, laid his views before some Glasgow and Liverpool merchants, and these, in conjunction with two English houses at Palermo, determined to enter on the speculation. Among the large mines that, owing to their being under water, had become quite valueless to their owners, were those of Riesi and Portella di Pietro, belonging to the Duke of Fuentes, who offered to let them on almost any terms. They were taken by the British merchants above alluded to on a nine years' lease, the lessees engaging, by way of rent, to pay one-fourth of the produce to the duke. Steam engines were procured from England, together with engineers, workmen, &c., and it was just when the accuracy of Mr. Craig's anticipations had become evident, and the speculators were looking forward to a large remuneration for their outlay, that the disastrous decree of 1838 appeared. Several other mines had in the mean time been taken on lease in different parts of the island by British capitalists from Prince Trabia, the Duke of Monteleone, and other Sicilian nobles; large sums had been expended on the mines, and in some instances, large pecuniary advances had been made to the proprietors, for which the lessees would no doubt have been amply remunerated, had the trade not suddenly been converted into a monopoly, which left the British capitalists no other choice than to dispose of their leases, together with the costly machinery, to the monopolists, at almost any price which the latter might be willing to give.

The British merchants in Sicily, naturally alarmed at the first rumour of a project likely to prove so ruinous to their interests, made application to Mr. Temple, the British minister at Naples, who immediately inquired of the minister for the affairs of Sicily as to the truth of these rumours. From that gentleman Mr. Temple obtained an assurance, "that he did not approve of the project, as he was averse to all such monopolies; that the construction of roads was a matter in which the government and the landed proprietors ought alone to be concerned; and that he might rest satisfied, that the project would not receive the sanction of his government."

This assurance was deemed satisfactory, and more than a twelvemonth elapsed before anything farther was heard of the matter. In September, 1837, however, the merchants of Palermo learned, to their great surprise, that the project had been formally submitted to the government in Sicily, which had approved of it by a majority of seven to four, and that Monsieur Taix, with whom the plan originated, had left Palermo for Naples, to

obtain the king's sanction to this decision of the Sicilian government. Application was, in consequence, again made to the British minister at Naples, who in his first letter to Lord Palmerston on the subject says:—

"I thought it right, in consequence of this information, to call again upon M. Franco and upon Prince Cassaro, when they both assured me that they disapproved of the project. M. Franco repeated to me his former objections to it, and added as another reason for opposing it, that M. Taix, not possessing any capital, would be unable to give any sufficient guarantee for carrying his part of the contract into effect.

"I represented to Prince Cassaro the great injury which the British, and indeed all other commercial interests, would suffer in Sicily by the proposed measure; and the injustice which would be done to parties who had already made contracts for the delivery of sulphur, and had vested considerable capital in that branch of commerce; and I added, that it appeared to me to be contrary to the stipulations of the treaty between England and Naples, that this government should prohibit British subjects from trading with private individuals in any article of commerce, and should favour other parties, whether foreign nations or private companies, by granting them exclusive privileges, to the injury of British trade.

"M. de Tallenay has received instructions from the French Government to use every endeavour to oppose the establishment of this monopoly, and to act in concert with me for that purpose. He has, therefore, also made representations to this government upon the subject. From the language of M. Franco and Prince Cassaro, I do not think it probable that M. Taix will succeed in his applications; but it is impossible to answer for the effect which private influence or erroneous ideas may produce. I wish therefore to receive the opinion of my government upon the subject, and instructions respecting the course I should pursue in case the matter is further proceeded in."

Lord Palmerston writes in reply, under date of the 27th October, 1837:—

"I have to desire that you will lose no time in apprising Prince Cassaro, that her majesty's government cannot consider the grant of such a monopoly in any other light than as an infraction of the treaty of 1816, the fourth article of which expressly stipulates that British commerce in general, and the British subjects who carry that commerce on, shall be treated throughout the dominions of the king of the two Sicilies upon the same footing as the commerce and subjects of the most favoured nations, not only with respect to the persons and property of such British subjects, but also with regard to every species of article in which they may traffic."

A long and tedious correspondence hereupon ensued between Mr. Temple and Prince Cassaro at Naples, and between Lord Palmerston and Count Ludolf in London, the Neapolitan diplomatists maintaining that the monopoly was no infraction of the treaty. This they were able to do with the better grace, in consequence of Lord Palmerston's mistake, in resting his case on the fourth article of the treaty, whereas it is

the fifth article only, on which any strong claim can really be founded. This treaty ought to have been printed in the papers laid before parliament, for without it the whole correspondence is obscure. It will be found, however, in the *Annual Register* for 1817, and the following are the fourth and fifth articles, upon which the whole question turns:—

"Art. 4. His majesty the king of the two Sicilies promises that British commerce in general, and the British subjects who carry it on, shall be treated throughout his dominions upon the same footing as the most favoured nations, not only with respect to the persons and property of the said British subjects, but also with regard to every species of article in which they may traffic, and the taxes or other charges payable on the said articles, or on the shipping in which the importations shall be made.

"Art. 5. With respect to the personal privileges to be enjoyed by the subjects of his Britannic majesty in the kingdom of the two Sicilies, his Sicilian majesty promises, that they shall have as free and undoubted right to travel and to reside in the territories and dominions of his said majesty, subject to the same precautions of police, which are practised towards the most favoured nations. They shall be entitled to occupy dwellings and warehouses, and to dispose of their personal property of every kind and description by sale, gift, exchange, or will, and in any other way whatever, without the smallest loss or hindrance being given them on that head. They shall not be obliged to pay, under any pretence whatever, other taxes or rates than those which are paid, or hereafter may be paid by the most favoured nations in the dominions of his said Sicilian majesty. They shall be exempt from all military service whether by land or sea; their dwellings, warehouses, and every thing belonging or appertaining thereto for objects of commerce or residence, shall be respected. They shall not be subject to any vexatious search or visits. No arbitrary examination or inspection of their books, papers, or accounts, shall be made under the pretence of the supreme authority of the state, but these shall alone be executed by the legal sentence of the competent tribunals. His Sicilian majesty engages on all these occasions to guarantee to the subjects of his Britannic majesty, who shall reside in his states and dominions, the preservation of their property and personal security, in the same manner as those are guaranteed to his subjects and to all foreigners belonging to the most favoured and most highly privileged nations."

The last sentence, it appears to us, contains the whole gist of the argument, and on that, and not on the fourth article, ought Lord Palmerston to have rested his remonstrance. His Sicilian Majesty guarantees to British subjects the same security of person and property as to his own subjects or to foreigners belonging to the most highly favoured nations. Under what plea, then, can he attempt to grant to a private company, whether composed of foreigners or of Sicilians, commercial privileges by which British subjects are deprived of the power of selling their property except at an enormous loss? Lord Palmerston is wrong in

laying so much stress upon the circumstance that the monopoly is granted to foreigners; had it been granted to Sicilians, or even to an English company, the act would equally have been an infraction of the treaty of 1816.

The correspondence between the British and Neapolitan governments, though it did not prevent the odious decree of 1838 from being issued, led at least to a modification of the first plan. The ingenuity of M. Santangelo, the minister for the interior, and the chief abettor of the scheme, was set to work, to secure all the effects of a monopoly by means of a decree from which the word monopoly should be carefully excluded. By such a wretched device did the Neapolitan government imagine they could impose upon the government and people of England! The royal decree or *rescritto*, constituting the privileged company, was signed at Naples on the 27th of June, and officially announced at Palermo on the 4th of July, 1838. We cannot spare room for the whole of this wordy document, but the following, from one of Mr. Kennedy's letters to Lord Palmerston, affords a fair abstract:

"Article 1 institutes the company of Taix, Ay-card and Co. (of Marseilles.)"

"Article 2 computes the annual quantity of sulphur exported at 900,000 cantars, and fixes the quantity to be henceforth raised at 600,000 cantars, which the company is to purchase, and awards a compensation of 4 carlins per cantar to the proprietors of mines for the 300,000 cantars which they are no longer to raise.

"Articles 3, 4, 5, relate to the manner in which the annual produce of each mine is to be ascertained, on its average produce during the years 1834, 1835, 1836 and 1837, or of the last year in which it was at work, if shut up at present, and according to the determined quantity the proprietor is to receive a fixed price for the two-thirds of the whole which he may extract, and the compensation of 4 carlins per cantar for the third which he must no longer extract.

"Article 6 determines that the deficit of one mine shall increase the produce of the others, unless the government allow the opening of another.

"Articles 7, 8, 9, relate to the obligation imposed upon the company to buy the sulphur at certain fixed prices, viz. from 21 to 25 taris per cantar, according to the quality, taking one-half of the quantity offered immediately for prompt payment, and the other half on payments within fixed periods—and to keep 150,000 cantars always ready for the demands of trade.

"Article 10 allows every body to sell their sulphur to whom they please (vide article 18).

"Article 11 fixes the periods of payment of the 4 carlins indemnity for the sulphur not to extracted.

"Articles 12 and 13 fix the capital, or security found by the company, at 1,200,000 ducats, two-thirds of which are to be paid up by instalments by October, the remaining third to be divided into shares, bearing 6 per cent. interest, and to be offered to proprietors and lessees of mines and Neapolitan subjects, and if the shares be not filled up by December the company is to pay up the deficit.

"The government associates itself to the company, and adds 600,000 ducats to the capital, thus making it 1,800,000 ducats.

"Article 14. The company is to pay from 1839 to the government 400,000 ducats annually for all the advantages they receive, at fixed periods—for the remaining five months of the present year they are to pay 66 2/3 grains per cantar for the sulphur exported, and the salary of the royal commissioners.

"Article 15 appoints three royal commissioners to represent the government, and superintend the execution of the regulations.

"Article 16 obliges the company to pay to the proprietors of mines one-third in advance upon their sulphur, for which good security can be given.

"Article 17 fixes the price at which the company is obliged to sell the sulphur—viz. at from 41 to 45 carlins the cantar, according to its value.

"Article 18 authorizes the company to receive two ducats per cantar for all sulphur exported without being sold to them.

"Article 19 confers the title of royal refinery upon the refinery of sulphur—established by Mons. Taix—at Girgenti, and grants to the proprietor of the same the privilege of exporting annually 20,000 cantars of sublimed sulphur free of duty. The proprietor, on the other hand, engages to supply the royal powder magazines of the departments of war and marine with brimstone gratis.

"Article 20 confirms the existing regulations for the working of sulphur mines.

"Article 21 allows the company to export, but not to sell its sulphur without the agency of royal brokers.

"Article 22. The company engages, within four years from its institution, to establish at its own expense a manufactory of sulphuric acid, of sulphate of soda, and of soda, and to employ and teach Sicilian apprentices.

"Article 23. The privileges of the company are granted for ten years, from the 1st of August, 1838.

"Article 24. On any difficulty arising, the commissioners, on the representations of the company, are to submit to the government the best means of remedying any injury likely to accrue to the company or any individual.

"Article 25. If the company exceed the sale of 600,000 cantars of sulphur, the government is to have one-third of the profits arising therefrom.

"Article 26 fixes the weights and measures."

By the 10th and 18th articles, it will be seen the exportation of sulphur by private individuals is permitted; but on what conditions? on payment of a duty of two ducats a cantar to the monopolists, a duty quite sufficient to make it impossible for any private merchant to compete in foreign markets with the agents of the company.

The motive assigned for limiting the export to 600,000 cantars, is a desire to prevent the too rapid exhaustion of the mines. This apprehension, there is every reason to believe, is a mere gratuitous piece of hypocrisy, since we have seen that by the application of British skill and capital many mines, abandoned by their owners as worthless, were about to be made productive again when this unfortunate measure was adopted. Besides, if any wish really existed to limit the export, the object has been effectually defeated by the 25th article.

The British merchants at Palermo met a few days after the promulgation of the *Rescritto*, and drew up a memorial to be transmitted to the government at home, in which the question is thoroughly discussed.

Some curious extracts may be made from the letters that passed between Lord Palmerston and Count Ludolf on this subject. There is much ingenuity in the way in which the Count and Prince Cassaro defend the conduct of their sovereign, whose policy they are both known to condemn.

"The undersigned," says the count in a letter written a few weeks after the promulgation of the decree, "considers it his duty to reply to this declaration of her Britannic majesty's government, and has the honour to point out to that government, that no interpretation can be given to the articles of the treaty of 1816, and particularly to the 4th and 5th articles, by which the rights of his Sicilian majesty can be invalidated; rights which he is fully at liberty to exercise with regard to his own subjects. In fact, whatever may be the interpretation which may be sought to be given to the treaty, and to the articles above mentioned, it can never be contended that his majesty, in the exercise of his rights, is bound to treat foreigners better than his own subjects. This would be a great paradox in policy; for the purport of every convention ought always, and at the most, to be, that foreigners should be treated and favoured similarly to the subjects of the state. The government of her Britannic majesty has, without doubt, momentarily lost sight of that which the undersigned has the honour to submit to the attentive consideration of his Excellency Viscount Palmerston; namely, that the question at issue relates to a mineral, which Sicily possesses almost exclusively; the production of which had been reduced to such a state of decline, as to oblige the government of his Sicilian majesty to regulate the working of the mines, with a view again to raise their value, and to restore the value of this kind of property of his majesty's Sicilian subjects."—p. 31.

In a subsequent letter, dated the 17th of September, the count puts forward the same argument in a more detailed form, and elicits the following reply from Lord Palmerston:—

"Her majesty's government," replies Lord Palmerston, "do not admit the fundamental position on which Count Ludolf's argument rests; namely, that no sovereign can be expected to grant to foreigners greater privileges or immunities than are enjoyed by his own subjects. For the undersigned must observe, that it is precisely for the purpose of securing in certain cases such greater immunities and exemptions, that treaties of commerce are frequently made. Because, in countries where the government is arbitrary and despotic, and subject to no responsibility or control, it may often happen that caprice, want of political knowledge, prejudice, private interest, or undue influence, may procure the promulgation of unjust and impolitic edicts, inflicting much injury upon the people of such state, interfering with the legitimate industry of individuals, deranging the natural transactions of commerce, and causing great detriment to private interests, and to national prosperity; and foreign gov-

ernments, whose subjects are engaged in commercial intercourse with the people of such state, are therefore often anxious to secure their subjects, by fixed stipulations, and by treaty engagements, from being liable to the injuries and uncertainties, which, from the above-mentioned causes, the people of the state itself are from time to time exposed to.

"Now the treaty of 1816, between Great Britain and Naples, contains a stipulation of this nature; and, according to that treaty, although the Neapolitan government may exercise its sovereign power over its own subjects, and interfere as it pleases with their private and commercial transactions, yet it cannot so interfere with or restrain the private and commercial transactions of British subjects.

"But the monopoly granted by the Neapolitan government to Messrs. Taix and Co., does interfere with and restrain the private and commercial transactions of British subjects in Sicily, by preventing those subjects from selling as they please the sulphur raised from the mines which they have rented, and to increase the productiveness of which they have expended a considerable capital. Therefore, the monopoly of Messrs. Taix and Co., is inconsistent with the treaty engagements of the Sicilian crown towards the crown of Great Britain; and the British government cannot consent that such monopoly shall have any application to the commercial transactions of British merchants in Sicily."—pp. 45, 46.

As far as it is possible to judge from the documents before us, Monsieur Taix entered upon this speculation without being possessed of the necessary capital for making the advances to which he had bound himself, and within a few months after the promulgation of the treaty, had the king of the two Sicilies been so disposed, he might easily have taken advantage of that gentleman's non-fulfilment of his stipulations to put an end to the contract altogether. That he did not do so would be creditable to the king rather than otherwise, were it not notorious that his unwillingness was owing rather to the importunities of the Duchess of Berri, his minister Santangelo, and others of the friends of Taix, who are generally believed to have had a direct pecuniary interest in the monopoly, than to any over-nice scruples of delicacy.

Taix having vitiated his patent, by the non-fulfilment of his engagements, applied in December, 1838, (five months after the decree had been issued,) for a complete modification of his plan. We will not trouble our readers with the details of the new plan, which was not adopted, but they are of some importance, as they led the King of Naples to refer them for consideration to his council of state and by this means the question of the monopoly itself was for the first time brought before that body. Till then the negotiations connected with this affair had passed only through the hands of Santangelo, the minister for the interior. None of the other ministers had even been invited to give their opinions on the subject, while

Prince Cassaro, as minister for foreign affairs, had been subjected all along to the irksome duty of defending a line of policy, which from the first he was known to have disapproved of.

At the first meeting of the council of state, the minister of the interior, Cavaliere Santangelo, moved that the modifications to the contract, proposed by Monsieur Taix, should be taken into consideration. Not one member of the council could be prevailed on to sanction the motion. The Marquis Pietracatella and Prince Cassaro observed that it would first be necessary that they should be made acquainted with the nature and details of the contract itself, which had never been properly discussed. The council, in consequence, broke up without coming to any decision, and the king determined to refer the whole matter to the council of ministers. This was done a few days afterwards, when a very animated discussion took place. Three out of the nine ministers insisted upon it, that as Monsieur Taix had not fulfilled the terms of his contract, (against the principle of which they at the same time entered a protest,) the modifications now proposed could not be taken into consideration; under these circumstances, they declared that Monsieur Taix ought to be called on to perform his original engagements to the letter, and that if he did not do so, the contract should be declared null and void. Five of the members of the cabinet adopted a more moderate policy. They were apparently as much opposed as their colleagues to the principle of the original plan; but apprehensive of giving offence to the king, they simply rejected the proposed modifications, and voted that Monsieur Taix be called on to execute the contract of June, 1838. Santangelo, finding himself entirely unsupported, affected indifference, and signed with the rest. As it was looked upon as certain, that Monsieur Taix had it not in his power to perform his engagements, this decision of the council was deemed a virtual annulment of the patent, and Mr. Kennedy, our Secretary of Legation, writes to Lord Palmerston, under date of the 18th of March, 1839, "As the original contract is generally admitted to be impracticable, I trust that this government has now found an honourable way of getting rid of it."

Had it not been for this impression, under which the British minister at Naples continued for nearly a year longer, it is probable that the negotiation would have been brought, much earlier than it was, to an abrupt termination. Prince Cassaro never concealed his condemnation of the monopoly, but Santangelo and the other patrons of the

company were indefatigable in their exertions to prevent the king from coming to a decision. Their object was delay. The stock of sulphur in France and England, they thought, would gradually become exhausted; if therefore, they could only keep things as they were for a little while longer, the article would rise to an exorbitant price, and all the advantages which the company had originally looked for, would be placed within their reach.

In May, Mr. Kennedy writes :

"Had the rest of the Neapolitan ministers been really as desirous of getting rid of the monopoly of Messrs. Taix and Co., as Prince Cassaro, opportunities would not have been wanting, and I am obliged to admit that I no longer entertain any immediate hopes of the contract being annulled, notwithstanding the wishes of the king."

In August, however, he writes in quite another tone: "I have finally the satisfaction of informing your lordship," he says, "that his majesty the King of Naples has decided that the contract made between his government and Messrs. Taix, Aycard, and Co. for the monopoly of the sulphur trade in Sicily, shall be set aside." A flaw, it seems, had been found in Monsieur Taix's agreement, by taking advantage of which the king might have destroyed the company by a side-wind. Their contract gave them no exclusive right to the exportation of sulphur from Sicily to Naples; and once at Naples, no law existed to make sulphur liable to an export duty, the *Rescritto* of 1838 bearing relation only to the exportation from the island of Sicily to foreign countries.

Thus there was opened a new theme for discussion. The Duke of San Giovanni, a steady opponent to the monopoly from the first, applied to the custom-house authorities at Catania for leave to ship five cantars (about eight hundred weight) of sulphur for Naples, without paying the premium. The custom-house refused the required permission. The duke applied to the Court of Intendency of Catania, one of the local courts appointed to decide all questions arising between the company and the proprietors of sulphur. The court gave sentence in his favour, but liable to appeal, as the other party had not appeared. In the mean time the custom-house referred the case to the head of the customs at Palermo, whence it was referred to the ministers of finance and the interior. The minister of finance instructed the custom-house authorities not to interfere with the course of justice; but Mr. Santangelo issued orders in every direction that all sulphur exported from Sicily, whether to Naples or any where else, should pay two

ducats (seven shillings) per cantar to Taix, Aycard and Co.

It seems to us that it was scarcely consistent with the dignity of the British embassy at Naples, to make itself a party to this and similar attempts to obtain indirect advantages over the company, and we are surprised to see Lord Palmerston in his dispatch of the 6th of September last, approving of such conduct. The only excuse for Mr. Kennedy is to suppose that he really believed what was constantly told him, that the king no longer sympathised with the minister of the interior, but was really desirous of setting the contract aside.

Mr. Kennedy writes to Lord Palmerston on the 29th of August :

"I waited, on the 24th, early upon Prince Cassaro, and found that his excellency had been with the king, and spoken with more than ordinary energy.

"The king assured the prince that the monopoly should be set aside ; that he would support him in taking proper steps to that effect ; and adding, with great feeling, 'I really thought, when I sanctioned the measure, that I was doing a good thing for Sicily ; hardly had I approved of it before I regretted it, but I shall never regret the first motives which induced me to sanction it.'

"Prince Cassaro immediately sent to M. Taix, desiring him to come to him on the following morning, when he communicated to him the determination of the king to get rid of the contract, and insisted upon his at once making his proposals. M. Taix asked leave to refer the question to Paris ; but Prince Cassaro observed, that the Neapolitan government knew but him, with whom they had made the contract. That, if the proposals were reasonable, the king would take them into consideration, if not, other means would be resorted to.

"M. Taix mentioned that the company had made immense purchases of sulphur in Sicily, and that there still remained six months' consumption in France and England (over which, I believe, the company has got control). Prince Cassaro promised that a certain time should be allowed the company to get rid of their stock.

"M. Taix, in the course of the day, sent in a calculation of 4,000,000 of ducats, equal to about 666,000*l.*, as a valuation of present loss, and of the profit they would be deprived of. This calculation is grossly exaggerated.

"There has been little outlay beyond the purchase of 450,000 cantars of sulphur (equal to 393 tons 14 cwt.), and the price of that article has risen sufficiently to indemnify them, even should it fall considerably as soon as it becomes known that the contract will be annulled."

The next stage in this paltry history of tergiversation is presented by the arrival of Mr. Macgregor at Naples. That gentleman was not, like Mr. Kennedy, imposed on by the assurances of Prince Cassaro, that "it was the wish and intention of the king to do away with the monopoly."

On the 13th of November last, Mr. Macgregor writes to Lord Palmerston, that Prince Cassaro had pledged himself, in the king's name, that the monopoly should terminate on or before the 1st of January.

"The king then agreed to my demand, but in order to avoid committing to writing a censure upon his own act, directed Prince Cassaro to pledge himself to the abolition of the sulphur monopoly before the 1st day of January, as named by me. I considered it, however, unsafe not to have the evidence of the representative of a friendly power to this arrangement, and the Austrian ambassador, Count Lebzeltern, who has all along been in perfect accordance with me, was authorised to state also to me, that the Sicilian government stood pledged to that of England to abolish the monopoly before the said 1st day of January. The minister of police went then, as instructed by the king, to M. Taix, and told him that, *coute qui coute*, he must prepare himself for the abolition of the monopoly, and M. Dupont, regisseur of the customs of the two Sicilies, was authorized to communicate this to me."

The despatch from which the above extract is taken, led the British government to suspend measures which had been in contemplation to encourage the importation of sulphur from other parts of the world ; but the 1st of January passed away without any change in the position of affairs ; and on the 21st of that month, Mr. Kennedy writes—"The friends of Monsieur Taix are again full of hopes respecting the stability of their contract, and I cannot learn from Prince Cassaro that this government has come to any serious determination for its abrogation."

Lord Palmerston now assumed, for the first time, a menacing tone, which only had the effect of leading to a renewal of the old system of procrastination. Prince Cassaro urged Mr. Kennedy not to insist on the presentation of Lord Palmerston's note to the king. Mr. Kennedy was with difficulty induced to withhold the note, which he did only on a positive assurance from the prince, that he would that very day make a strong appeal to the king on the subject. In a few days afterwards Mr. Kennedy received the following note from the prince, marked "confidential :"

"Naples, 23d Feb. 1840.

"The sulphur question is settled. Every thing done by his majesty has been done out of deference for England. I hasten to inform you of this, knowing how agreeable it will be to you, and how great is the interest you take in it. The king, however, expects that Mr. Temple will arrive furnished with the necessary powers to sign the commercial treaty, in order that both the important negotiations, which we have at present with Great Britain, may be brought to a happy conclusion ; at the same time we trust the bonds of friendship between the two countries will thus be drawn closer and closer.

"I beg you, however, to keep this secret, until the affair be published ; lest we should get into difficulties with M. Taix.

"(Signed) "Accept, &c.
THE PRINCE CASSARO."

In this note, it will be seen, no period was fixed for the re-opening of the trade, so

that the only point gained was, that a written promise had been given that the monopoly should be put an end to at some indefinite period. Lord Palmerston's forbearance was at length exhausted. He made a formal demand for the immediate abolition of the monopoly, and obtained orders from the admiralty, that if within a week a favourable answer should not be received, Sir Robert Stopford should sail from Malta to make reprisals.

Even this, however, could not induce the Neapolitan government to abandon their system of delay. The king commanded Prince Cassaro to sign a note declaring "that the sulphur monopoly was not a violation of the treaties with England and France, and that therefore it should be maintained." Prince Cassaro, rather than affix his signature to such a note, tendered his resignation, and the Prince di Scilla was appointed his successor. The new minister immediately wrote to Mr. Temple to say that he was entirely unacquainted with the sulphur question, but would "immediately devote his attention to the subject, in order that he might make himself fully conversant with it." The object was renewed delay, by means of renewed negociation; but so gross an attempt at imposition could not of course be tolerated. Somehow or other, nevertheless, the wily Neapolitan kept Mr. Temple in play for a little time longer, and it was only on the 1st of April that Mr. Temple took at length the decisive step of calling on Sir Robert Stopford to execute the instructions he had received from the Admiralty.

Such is a plain narrative of an affair disgraceful to the government of Naples, and not very creditable to that of England, which has allowed itself to be trifled with for nearly two years, and has now suffered itself to be drawn into a new negociation, the term of which it is impossible to foresee.

In the meantime the trade of Sicily is in imminent peril; even should no other mines be worked for the supply of the English market, chemical experiments have been made in England, which are said to have led to the discovery that sulphur may be extracted in a very pure state, and at a small expense, from pyrites, a substance which is found in great abundance in the United Kingdom. Thus, before long, it may be found that for a paltry sum of money, for a mere bribe, in fact, the royal family of Naples have sacrificed the only remaining trade of any importance, of which the unfortunate people of Sicily still continued in possession. Can we wonder that under these circumstances there should ex-

ist in that island, such a detestation of the Neapolitan rule, that, as Von Raumer assures us, on the appearance of the cholera there, an opinion prevailed with many, and those not among the lower orders, that the government had purposely introduced the disease into Sicily, in order to wreak its vengeance on the inhabitants! Others again, the professor assures us, though they acquit the government of any wish to carry their tyranny to so atrocious an extreme, nevertheless firmly maintain, that Sicily is—

"purposely kept in poverty and wretchedness, in order that misery may reduce the population to blind and passive obedience, or that by driving them to despair, a pretext may be afforded for the exercise of the most unbounded tyranny and despotism. Others add, that the government is unconsciously impelled to such a line of conduct by the Carbonari, who still exist in Naples. In former times, it is argued, Sicily afforded a secure asylum to the royal family; a *point d'appui* whence Naples might be reconquered; but should Sicily be completely estranged from its rulers, and urged to irreconcilable hatred and rebellion, the revolutionists of Naples would have their rear free, and would encounter less difficulty in the execution of their designs. These feelings are not unconnected with dreams and hopes of entire independence, revolutions in Europe, aid from England, and some even look forward with longing to the idea of British domination, a state of things perhaps more likely than any other to lead to an amelioration in the condition of the people."

We need hardly add, that we are not among those who ascribe to the Neapolitan government any designs of deliberate oppression for oppression's sake. We quote Von Raumer's account of the opinions that prevail in Sicily, merely as they serve to illustrate the state of public feeling in the island, and the long continued system of misgovernment, which alone could lead a people to impute such motives to its rulers. "The condition of Sicily," exclaims Von Raumer, "is infinitely more hopeless than even that of Ireland!" He has viewed Ireland through the medium of those exaggerated statements to which party declamation has given birth, and his exclamation conveys, therefore, a lively idea of that extreme prostration to which the lovely island of Sicily has been reduced. The general feeling of disaffection to which this has given rise is so notorious, that not only are no troops raised in Sicily, but the Sicilians are even excluded, as much as possible, from the military service, lest a knowledge of military affairs might qualify them to offer effectual resistance to their masters. Such a state of things cannot last. There must be a change of some kind, and it is not impossible that the events to which the discussions on the sulphur question may yet give rise, may lead to the establishment

of a more rational system of government. The loss wantonly inflicted on British merchants, by a disregard of existing treaties, will have to be paid for, and Lord Palmerston, with all his love of ease, will not dare to shrink from the exaction of the uttermost farthing due to our defrauded countrymen, and with somewhat more justice than with respect to the Chinese contrabandist. The king will be taught a moral lesson that may prove of lasting value to him. When he finds how costly an indulgence is the infraction of treaties, or the violation of public and private rights, he may be led to infer, that a different course of policy is likely to lead to different results. He is young and ardent, and should his zeal once be directed into a wholesome channel, he will soon disengage himself from the clique that at present hold him in their trammels. This change must be the first step in the march of improvement; but this step once taken, other and more important ones must follow.

Amid other points which illustrate the excessive meanness of spirit that marks the Neapolitan government, may be enumerated the petty vengeance of the king in insisting on the recall of Mr. Temple by the British government, from no other cause than the honest discharge of his ministerial functions. To Mr. Temple it is a matter of small moment, as his relative, Lord Palmerston, will not be in administration, probably, on his return, nor any of his colleagues.

ART. VII.—1. *Colonization of South Australia*. By R. Torrens, Esq. F. R. S. Chairman of the Colonization Commission for South Australia, 1835.

2. *The New British Province of South Australia*. Second Edition. 1835.

3. *Annual Reports of the Colonization Commissioners for South Australia, (presented to and ordered to be printed by the House of Commons,) for 1836-7-8.*

4. *The South Australian Record*. Vol. I. (From November, 1837, to December, 1839.) 1840.

THE colonization of South Australia is, perhaps, one of the most interesting experiments of modern times, and one which can scarcely have failed to have engaged the attention of every student in political and social economy; but hitherto much of what has been written on the subject has been so tinged with partial exaggeration on the one hand, or so charged with prejudice and misrepres-

entation on the other, that the calm investigator has felt it difficult to obtain sufficient well-authenticated facts, to guide him safely to a decision on the question, whether or not this experiment has succeeded; and if so, to what extent its success ought to modify previously conceived notions on colonization?

The colony has now been established three years, and more ample information has reached England of the details of its establishment, than has probably ever before been furnished respecting the planting of any other colony. Upwards of twenty books and pamphlets have been written on the subject, reports have been annually presented to parliament, and, for the last two years, a newspaper, confined to South Australian matters, has been published monthly (now weekly) in London, so great has been the public desire for information, and the corresponding endeavours to meet the demand. Files of newspapers published in the colony have also been received, and furnish to the cautious reader probably a clearer insight into the springs of human action and causes of success or failure, than perhaps any other source of information; to which may be added, numerous private letters to and from persons of all classes, politics, and creeds; one of which, from a relative of the writer, of the latest possible date, may be safely relied on for its statements. As in a multitude of counsellors there is wisdom, so in a multitude of witnesses there is truth; and, although their varying and opposing testimony may show the *animus* of each, yet, by gathering up points on which all agree—an inadvertent admission from one, an unconscious concession from another—and, after due allowance for prejudice, comparing and amalgamating the conscientious evidence of all, it is presumed that a solution of the foregoing questions may now safely be sought for, and with no great difficulty be found.

The project for colonizing South Australia came before the public with almost startling pretensions, as an experiment which was to commence a new æra in the history of political economy, which, by facilitating the natural diffusion of the means of creating wealth, and developing the hidden resources of wild and untrodden portions of the earth, should renovate the energies of old states and create new ones; transform millions of miserable and starving paupers into communities of happy and thriving yeomen, and accelerate the period, when the economical creation and unrestricted interchange of the surplus produce of all parts of the globe shall place the human family in a more favourable position than it has yet known. The simple plan by which it was proposed

to effect these important results, was that of selling the wild lands of our colonies at a price per acre high enough to pay for carrying out a sufficient number of labourers and mechanics to cultivate and raise upon them all the necessaries and comforts of life. In order fully to appreciate the value of this previous proposition, and the probability of its success, it may perhaps be advisable to glance at the principles, or rather absence of principle, on which colonies had been established up to the time when this new scheme was propounded. It is an actual fact we believe, and proves how Utopian our early notions were, that New Holland was looked forward to by some sanguine members of the government as affording the best means of liquidating the national debt, by a certain charge per acre on all land.

The founding of a colony has been called by Bacon "an heroic work," and is indisputably one of the most important of human enterprizes, but probably on no other national operation had there existed such a deplorable absence of all principle or system. On this subject experience seemed to have furnished no wisdom, the uses of adversity no guide. The last formed English colony at Swan River had failed, from nearly similar causes as the first English colony in Virginia, namely, excessive grants of land and an ignorant non-observance of the necessity of combining land, labour and capital in proper proportions, so that these grants of land might be profitably cultivated. The existence of the apparent anomaly of high profits and high wages in new colonies, was noticed long since by Dr. Adam Smith, who appears, however, to have altogether overlooked the possibility of producing, and almost indefinitely extending, this prosperous state of affairs by artificial arrangement. He says—

"In the different colonies, both the legal and the market rate of interest run from six to eight per cent. High wages of labour and high profits of stock, however, are things perhaps which scarce ever go together, except in the peculiar circumstances of new colonies. A new colony must always for some time be more under-stocked in proportion to the extent of its territory, and more under-peopled in proportion to the extent of its stock, than the greater part of other countries. They have more land than they have stock to cultivate. What they have, therefore, is applied to the cultivation only of what is most fertile and most favourably situated, the land near the sea shore and along the banks of navigable rivers. Such land, too, is frequently purchased at a price below the value even of its natural produce. Stock, employed in the purchase and improvement of such lands, must yield a very large profit, and consequently afford to pay a very large interest. Its rapid accumulation in so profitable employment, enables the planter to increase the number of his hands faster than he can

find them in a new settlement. Those whom he can find, therefore, are very liberally rewarded."

The conditions on which high profits and high wages are here made to depend, are an under-stocked and under-peopled territory. The natural consequence of this disproportion is, however, fully set forth in the passage we have placed in italics. The servant who is liberally rewarded soon becomes a master, and more liberally rewards others, who in turn do the same; till at length there is nobody left to employ, and industry and capital, from being thus minutely subdivided, are frittered away in isolated and comparatively profitless struggles for the means of existence. This state of things has been experienced in most of our colonies, and most disastrously where land has been sold "at a price below the value even of its natural produce." Dr. Smith, however, stopped short of this difficulty, with which indeed few of our political economists seem disposed to grapple. Mr. McCulloch says,* in speaking of the success of our North American colonies,

"On the first foundation of a colony, and for long after, each colonist gets an ample supply of land of the best quality; and having no rent and scarcely any taxes to pay, his industry necessarily becomes exceedingly productive, and he has every means and every motive to amass capital. In consequence he is eager to collect labourers from all quarters, and is both willing and able to reward them with high wages. But these high wages afford the means of accumulation, and joined to the plenty and cheapness of the land, speedily change the more industrious labourers into proprietors, and enable them in their turn to become the employers of fresh labourers; so that every class participates in the general improvement, and capital and population advance with a rapidity hardly conceivable in old, settled, and fully peopled countries."

The cheapness of land and dearth of labour, which are here adduced as being the immediate causes of improvement in all classes, are in fact only productive of such improvement up to a certain point, when they in turn become positive impediments to improvement, the power of obstruction increasing in the same ratio with the extent of these supposed elements of prosperity; and it would not be difficult to prove, that in every colony where prosperity has been found co-existent with cheap land and dear labour, it has grown up in spite of these conditions rather than in consequence of them.

Some colonies have prospered on the labour of slaves, others on that of convicts; some again have had concentration forced upon them by uncleared forests, wild beasts, or hostile aborigines. If an instance were

* Commercial Dictionary, p. 329, 2d edition.

required where cheap land and dear labour has had a fair trial, and utterly failed, it will be found in the melancholy case of Swan River, where the advantages of the finest climate and one of the finest countries on the globe have failed to neutralize the disastrous effects of the vicious combination of cheap land and dear labour. Land was there sold at eighteen pence an acre, and labourers secured any sum they chose to demand. The natural consequence is, that the greater portion of the land originally granted remains a desert, the capitalists are ruined and dispersed, and the bulk of the labourers who had the power have left the colony, not however before several of their number had perished of hunger on the wild and useless land which they had madly purchased with their high wages, and had not capital to till.

It was reserved for the highly talented author of *England and America* to probe this fallacy to the core, to lay bare its baneful and insidious ramifications, and to suggest as its cure, that as our colonies had a superabundance of land as compared with labour, and Great Britain had a superabundance of labour as compared with land, an attempt should be made to produce a prosperous equilibrium between these two elements of wealth, by selling colonial wild land at a sufficiently high price to pay for carrying out labourers to work upon it, the price of the land being, in fact, paid for the certainty of procuring labour. It was wisely assumed, that wherever land can be had for nothing, and plenty of labour for hire, capital would be sure to find its way; the mere purchase of the land being taken as a sufficient indication that the purchaser had the means of working it. As with most new projects of magnitude, this suggestion was at first treated with ridicule, then acrimony, and then adopted. The limits of this article will not permit us to do more than touch upon the curious controversy which succeeded its promulgation, even supposing that the exhumation of, and inquest upon, defunct fallacies were an agreeable process. Suffice it to say, that the project was warmly taken up by a body of intelligent and influential gentlemen, who, in the summer of 1831, formed themselves into a committee, with a view to establish a chartered company for the purpose of trying the experiment. The first question, of course, related to the site of the intended colony. After much inquiry, and taking every measure to obtain the best information that could be gained, the committee determined on selecting that portion of the south coast of Australia which includes Spencer's and St. Vincent's gulfs and the

mouth of the Murray, the finest river in Australia. Even at this early period, so advantageous did the project appear to the public, that during the negotiations between the committee and the government respecting the charter, a very considerable body of emigrants had been collected together, ready to depart with the first colony. All at once, however, the cup of hope was dashed from their lips by the refusal of the government to grant a charter. This unlooked-for opposition, in a quarter where the projectors had hoped to find support in their arduous struggle to demonstrate, with their own resources, the value of a principle which they deemed of such importance to the future happiness of the human race, was, for a time, fatal to the scheme. Some of the would-be-emigrants were disgusted, others were discouraged, and all were dispersed. The men, however, who had the mind to conceive, and the courage to attempt to execute, an enterprise of such boldness, were not of a temper to be cowed by a difficulty of this nature. Their scheme had been fairly launched on the ocean of public opinion. Its elastic buoyancy was fully proved, and it rose in public estimation in an exact proportion to the force which had been applied to sink it.

This mortifying failure, however discouraging at the time, was not altogether untended with good in the result. The plan was more elaborately discussed, more maturely organized, and time was given for a more thorough investigation and adjustment of those minor details, upon which so much of the success of emigration at all times depends, and a minute attention to which was more than usually necessary in the trial of a new experiment. The projectors also took measures for disseminating information on their objects far and wide, extending the circle of their adherents, and "agitating" the mercantile world on every available opportunity.

A most interesting and numerous public meeting at Exeter Hall in June, 1834, was attended by many of the most enlightened men of the day. The leading principles of the scheme were adopted in resolutions, and prospectuses for the establishment of a new association were liberally distributed. As far as the public were concerned the plan met with a most decided support; sanguine hopes were entertained that in an atmosphere so changeable as that of the colonial office, the political barometer would at no very distant period "set fair," difficulties seemed to vanish as they were approached, a new association was formed, and new negotiations were opened with the government, backed

by men of high influence and acknowledged wealth.

Nor was the press idle. An interesting little volume, under the title of "The New British Province of South Australia," explaining the project, and giving all the information respecting South Australia which could be collected, rapidly went through two editions. Colonel Torrens, in his valuable book "The Colonization of South Australia," triumphantly defended the principle, subjected it to a more elaborate investigation than it had previously experienced, and traced the effects of colonization generally on the manufactures, commerce, and agriculture of the United Kingdom. These exertions were not without beneficial results; public opinion began to set in with a strong current in favour of the scheme, and after many squalls and buffetings from unfavourable influences, a bill embodying the new principles, and authorizing the foundation of the colony, was carried through the House of Commons by Mr. Spring Rice, and the House of Lords by the Duke of Wellington. It received the royal assent on the last day of the session of 1834. The first act of Lord Glenelg, on succeeding Lord Aberdeen in the colonial office, was that of gazetting the commissioners, who were to carry the act into operation.* An act of parliament was in many respects more advantageous than a charter, and certainly a great improvement upon the project of 1831, in which, instead of applying for a grant of land equal to the extent of Great Britain, which has been secured to them under the act, the projectors proposed to *buy* 500,000 acres of land at 125,000*l.*, or five shillings per acre, the sum which the government had fixed as the price of Australian waste land! Never, perhaps, has there been shown a more singular instance of the value of perseverance.

Still the act was clogged with several restrictions which pressed grievously on the infancy of the colony. The powers of the commissioners were not to commence until they had invested the sum of 20,000*l.* "in the purchase of exchequer bills or other government securities," as a security against any cost which the attempt to establish the colony might entail on the mother country; and also until the sum of 35,000*l.* should have been paid to the commissioners for wild land in the colony, to ensure that the

project had the confidence and sanction of capitalists. Like the last feather on the back of the camel, these hard conditions might have been expected to break the back of the strongest project. The absurdity of supposing that the small sum of 20,000*l.* was any thing like a sufficient indemnity for government assistance, in the event of failure, was no bar to the exaction. It was "in the bond," and must be complied with. To raise this small sum, however, on security of a land fund which had no existence, and to induce persons to form such land fund by paying down twelve shillings per acre hard money for wild land, respecting which all they knew was, that it lay somewhere at the antipodes, were difficulties that might have appalled even stouter hearts than those of the South Australian projectors. After some difficulty, however, the money was raised, but at the high interest of ten per cent. ! The prescribed sale of 60,000 acres of land at twelve shillings per acre was also effected. This being the minimum price at which, under the act, the land could be sold, the maximum being 2*l.* per acre.

The next business of the colonists was to look about them for a governor, the government having liberally given up its patronage in this instance, and, in order to give the colonists a fair chance, consented to sanction the nomination of the commissioners. The governorship was offered to General (then Colonel) Napier; and here another difficulty arose. The colony was to be essentially *self-supporting*; no assistance was to be hoped for from the government; the colonists were to rely on their own enterprise, courage, and resources; and the whole process of colonization in this instance was to resemble the removal of a full grown tree, with every branch, root and fibre entire.* The community to be formed in England was to be perfect in all its parts, and every part, on being transplanted, was to fall into its ordinary position, and perform its ordinary functions; indeed, the experiment was intended to show that not only a mass of human beings might be removed, but that an *organized* mass—that *society* might be removed. Many persons, who honoured the philanthropy of the motive, and the generous confidence in the general love of order and virtue amongst men, which this view of the matter indicated, were yet convinced that to follow out the same fanciful analogy in the tree of society as in the veritable tree, the foliage of civilisation, the flowers of refinement, and the fruits of science and philosophy, must inevitably drop off in the process of

* These were nine in number: Col. Torrens, F. R. S. Chairman, Edward Barnard, Esq., William Hutt, Esq. M. P., William Alexander Mackinnon, Esq., M. P., Samuel Mills, Esq., Jacob Montefiore, Esq., George Palmer, jun., Esq., James Pennington, Esq., and Josiah Roberts, Esq.

removal. That in both cases nourishment must be drawn from *the earth* before healthy progress could be secured; and that indeed all that the projectors could expect to ensure would be a state of unprecedented facility for the formation of a new society out of the well-proportioned materials of the old. The possibility of producing such a state of things, of making a community by the force of moral polarity alone, fall into at least an approximation to organized society, was largely conceded. Colonel Napier, however, had no such confidence in human nature. He refused to accept the appointment unless he had the command of 200 *British soldiers*, and power to *draw upon the English government for money* in case of need, equal to the power given to Sir J. Stirling for Swan River.* Perhaps there is no more curious instance in the whole range of literature of the different views taken of the same matter by the philosopher and the soldier, than the reasons which Colonel Napier shortly afterwards published for these demands, and which may be taken as a *catalogue raisonnée* of all the current fears and fallacies of that day on the question. It is scarcely necessary to state them, and it may be sufficient to say that his military notions completely disqualified Colonel Napier to direct a colony founded on the South Australian principle.

Although it is manifest from Colonel Napier's book that he wished well to the project, and felt most anxious that both settlers and *natives*, should receive justice and protection; it was also evident, from his idea of the necessity of *military* government, that he failed altogether to recognize the spirit of the project, and consequently all expectation of advantage from his appointment as governor at once vanished. The greatest philosopher of his day, Francis Bacon, had recommended *martial law* for the first colony of Virginia (1611), Colonel Napier was therefore not without the precedent of a high name; and his mistake arose from his ideas of colonization being two centuries behind the age,—a mistake by no means surprising, the art itself being two centuries behind.

The office of governor ultimately devolved on Captain Hindmarsh, who in H.M.S. Buffalo, anchored in St. Vincent's Gulf on December 28, 1836; the ships Duke of York and John Pirie having been previously sent out by the South Australian Company, which now existed as a body of

traders, without any connection with the commissioners. This company, having purchased a large portion of the preliminary sales of land at 12s. per acre, had thus formed the first settlement on Kangaroo Island. Colonel Light, an officer of distinguished reputation, (the friend of Captain Hindmarsh, and at his request appointed surveyor-general), had also arrived in the previous August with the surveying staff, and had decided on the site of the first town. The first matter which pressed itself on the public attention, after proclaiming the province, was a difference of opinion between the governor and the surveyor-general, the former refusing to sanction the site chosen by the latter. As this contention caused much unpleasantness in the colony, it may perhaps be advisable to give a description of the site itself, and the general nature of the country on the east coast of Gulf St. Vincent. The best general description we have met with is by Mr. J. Morphet, in a letter quoted from the Second Annual Report of the Colonization Commissioners. It ought first, perhaps, to be mentioned, that the instructions given by the commissioners to Colonel Light were, that he should select a site combining as many as possible of the following advantages, namely, 1, a commodious harbour, safe and accessible at all seasons of the year; 2, an abundant supply of fresh water; 3, a considerable tract of fertile land immediately adjoining; 4, facilities for internal communication; 5, facilities for external communication; 6, the neighbourhood of extensive sheepwalks.

The principal guiding reasons for selecting this particular site are stated by Mr. Morphet to be the following :

"It was central, and distant from every penal settlement.

"It commanded the waters of the two gulfs, which from their character were well adapted to internal water communication.

"It promised facilities for constant and safe intercourse with Kangaroo Island, which was regarded by the commissioners, from the testimony of Flinders and Sutherland, as a valuable portion of the province.

"From the contiguity to the Southern Ocean, and the prevalence of the south-west winds, it authorized the expectation that it would be visited with an abundance of rain. This was stated very clearly and forcibly by the talented chairman of the South Australian Commissioners, in a speech made by him in London, in September, 1836, on the occasion of a dinner given to his excellency the governor.

"It offered a considerable extent of fine land, Captain Sturt having stated that between the eastern coast and Lake Alexandrina, from Cape Jervis to the head of the Gulf, there were 7,000,000 of acres of highly fertile and beautiful land.

"It was likely to afford the easiest and best line of communication with the Murray; and there was

* Colonization : particularly in Southern Australia, with some Remarks on Small Farms and Over-Population. By Colonel Charles James Napier, C.B.

testimony of the existence of a good port towards the head of the gulf, with a supply of fresh water."

Mr. Gouger, now colonial secretary to South Australia, who appears to be a most candid writer, and who was amongst the very earliest persons who saw the value of, and laboured for, the project, thus speaks respecting the site.*

"The town of Adelaide is situated about six miles inland from the sea to the eastward, and about four miles from the range of hills above mentioned; it is in the midst of a very fertile plain, through which run, from the mountains towards the sea, several small streams of fresh water. In determining where to fix the chief town, Colonel Light had to consider *whether it was more desirable to place it away from the harbour, but on a stream of fresh water, or at the harbour, but where all the fresh water the inhabitants required would have to be brought from a distance.* He decided in favour of the first of these, and for many reasons he will be thanked for it by posterity. The only objection urged against the chief town being at a distance from the harbour is the expense of conveying imports from the harbour to the town; but the distance is not great, and the country between them being nearly a dead level, nothing could be easier than to dig a canal, or put down a railroad, when the amount of trade should render either worth the expense. A town will, however, eventually arise at the harbour; and such of the purchasers of the preliminary sections as desired it, were allowed by the colonial commissioners to select land there in lieu of town acres in Adelaide. By this arrangement twenty-nine acres were taken there, and by it the chief town will be relieved from the presence of those low publicans and other loose people who are always found at ports lying in wait for sailors. The town at the port will in fact be to Adelaide what Wapping is to St. James's."

Considering that for a considerable period the wealth of the South Australians must be drawn from the land rather than the sea, the wisdom of the selection must, we think, be apparent to all; and the expressed determination of Captain Hindmarsh to remove the principal town to Encounter Bay, which subsequent inquiries have shown to be a very dangerous coast, must be attributed to a professional predilection for naval rather than pastoral pursuits. At all events, the fact of the town acres which remained after the preliminary purchasers had selected theirs being publicly sold by auction at 6*l.* 0*s.* 9*d.* per acre, fully proved that the body of colonists gave a hearty sanction to the selection.

It is not our intention to enter into the causes of the manifold squabbling in the colony which led to the resignation or suspension of many of the officials, the recall of Captain Hindmarsh, the appointment of Colonel Gawler, and the resignation of Colonel Light. There are so many diffi-

culties in the establishment of a colony, and men who have embarked their lives and fortunes in the enterprise feel so strongly and speak so freely, that some disagreement must always be anticipated. Wherever these disputes right themselves by public discussion, without the authorities proceeding to harsh and offensive extremities against the freedom of opinion, there is evidently nothing very deep-seated in the grievances, and not much to complain of in the authorities. No colony has ever yet been settled, even under martial law, without such dissensions, but they have seldom been heard of in England. South Australia has had the advantage of a powerfully written press, in which the conduct of persons in authority has been most unsparingly canvassed. Public meetings have been held almost from the commencement; and although not free from asperity and ill-nature, yet the free expression of opinion seems to have operated like a safety-valve, and the controversialists, like the combatants in the clachan of Aberfoil, produced more noise and clatter than serious mischief. It is no small compliment to the character of English colonists, that these matters have righted themselves so readily; they would scarcely, perhaps, have done so with a colony of any other race.

Our inquiry has been thus far nearly confined to such matters in the establishment of South Australia as may become questions of interest in the settlement of any other colony; and having now traced the project into full operation, our limits will only admit of a few statistical particulars respecting its progress down to the present period, and a speculation or two in reference to its future prospects.

In perusing the history of a colony, few things are apt to strike the mind of the reader more forcibly than a chronological table of events; but the progress of any other colony bears so very little resemblance to that of South Australia as almost to excite our special wonderment. Let us compare it in passing with that of New South Wales, which it will be recollected was founded in 1788. On consulting Mr. Montgomery Martin's book,* we find that in the *third* year of the colony the first brick house was finished; that in the *sixth* year the first church was built; that in the *fifteenth* year the first newspaper was printed; in the *twenty-second* year there were the first police, naming of the streets, market, race, and race-ball; the *twenty-ninth* year saw the

* Six Months in South Australia.

* History of Australasia.

supreme court and first bank established; in the *thirty-third* year was built the first Wesleyan chapel; in the *thirty-fourth* year the freedom of the press was granted, and first agricultural and reading societies formed; in the *thirty-sixth* year the first court of quarter sessions was held; in the next year the first criminal jury was impaneled, and the year after the first coroner appointed, and first constitutional country meeting held; and the first civil jury was impaneled, and first college founded, in the *forty-second* year of the colony.

Four years ago, the wild silence of the shores of South Australia was only broken by the occasional scream of the gaudy plumaged parrots in the woods, the flocks of wild fowl in the creeks, or the gentle ripple in the brook. The very few natives,—who had picked up a scanty and miserable subsistence on the gleanings of that beautiful country,—whose simple minds were scarcely more intelligent than the kangaroos which their forefathers had taught them to chase, or the half-savage dogs with which they hunted,—exulting and luxuriating in the enjoyment of mere animal existence,—had scarcely seen the face of a white man, or deemed that such existed, much less that white men could ever be expected to come amongst them. At the moment at which we write, at least 15,000 white people have taken possession of their country. The banks of the Torrens have been transformed from a valueless wilderness into a bustling and thriving town of seven hundred houses, the site of which is worth from 100*l.* to 1500*l.* per acre, and are joined by a bridge lit with lamps. Scarcely a ship had been then seen to cleave the waters of the South Australian gulf. Ninety-seven ships of 21,232 tons burden entered the colony in 1838; and even a greater number, ninety-nine ships of 21,109 tonnage, were counted at Port Adelaide within the *first six months* of 1839. The powerful agencies that British enterprise is capable of putting in operation, are visible in the 68,000 sheep which are now extracting wealth from the pastures; the 6,250 cows and oxen and 520 horses which are now supplying food and labour to the enterprising settlers, who are exploring every crevice and cranny of the country. Nearly all the circumstances before quoted from the chronology of New South Wales have long since taken place in South Australia. A church, a Wesleyan and other chapels, three newspapers (two, at least, conducted with considerable talent), a well-organised police force, a mechanics' institution and reading-room, courts of quarter sessions, petty sessions of the magistracy, courts for the recovery of debts un-

der 20*l.*, a supreme court for civil and criminal trials by grand and petit juries, a coroner, a market, races, public balls, and public meetings,—are advantages which the South Australians have been fortunate enough to enjoy already; and it speaks much for their liberality and intelligence, that within four days no less a sum than 4000*l.* was raised by subscription for the foundation of a college which should provide first-rate education, and thus supersede the necessity of sending children from India to Great Britain for that purpose.

It is a matter of interest to inquire how far capitalists have been induced to invest their money in land under the new project. The following is a statement of the amount of money received by the commissioners in this country for land within the last three years. The two first columns are from the official report.

	1837.	1838.	1839.
Money invested in land	3,300 <i>l.</i>	37,800 <i>l.</i>	48,336 <i>l.</i>
Emigrants sent out free	1,227	3,154	5,300

And we are certainly led to the conclusion of the success of this colony, in addition to minor auspices, by the steady progressive increase in the investment of capital on the faith of the new principle, after the effervescence of novelty had subsided, extending over a period of three years. This is a gratifying and conclusive proof that the plan has been held in high estimation by capitalists in this country. But even this view by no means conveys a just idea of the tendency of capital to flow into colonies founded on the new principle. A man who desires to take out certain industrious labourers and their families, who are willing to follow his fortunes, has only to go to the Adelphi Terrace and to purchase an eighty-acre section of land for every two labourers and their wives whom he may wish to take out with him. All persons, however, who know of no such labourers, and are unwilling to take the trouble to look after them (the commissioners pay no fee to the agents who may have selected applicants, afterwards chosen by land-purchasers), do not visit the Adelphi Terrace, but prefer taking their money out in their pockets to taking out land orders. This remark applies equally to those who have full confidence that their money, should they buy land in the colony, will be fairly and wholly applied to the carrying out of labourers. It cannot be doubted that these classes of persons form a very large proportion of those who ultimately buy land in South Australia; to whom must also be added all who are ignorant of the high character of the commissioners, and the nature of the country,

and who prefer seeing what they are about to buy, before they part from their cash. All these persons take their money to the colony. In every new colony, too, there are sure to be found some shrewd, scheming, old colonists from the neighbouring settlements, who, having a thorough knowledge of the comparative value of colonial land, are always ready to pounce upon any district which promises to turn out profitable, and have large capitals at their command. We know that many such persons have left the other Australian colonies for South Australia; and that they have there made large purchases in several of the finest districts. Much fierce controversy took place on the promulgation of the new principle respecting the value of concentration; one party contending that it was indispensable to success, and another that it would insure failure by forcing inferior land into cultivation, whilst rich land lay useless. The golden mean seems to lie in concentration on the best land; and this object has been admirably effected by the plan of "special surveys," which gives an elasticity to the system, to which much of its success must be attributed. Under the regulations of the commissioners, any person depositing the sum of 4000*l.* for 4000 acres of land is entitled to have 15,000 acres surveyed of any district he may point out, and to select his 4000 acres in one block, from any portion thereof. The value of such a plan in promoting the formation of secondary towns, and the earliest possible development of all the most available resources of the country, must be obvious. The inducement it has offered to invest capital is truly astonishing. Within the short period ranging from the 14th of January to 20th of July, 1839, no less than twenty-eight special surveys, of 4000 acres each, were taken in the colony.

If practical colonial agriculturists invest their money thus freely, where money bears ten per cent. interest, the unemployed capital in this country will soon find its way there. The English capitalist, however, who has an eye to this profitable investment, should keep steadily in view the necessity of a supply of labour. By purchasing his land in this country, he will be able to take out two labourers and their wives (on whom he can depend for their labour for at least the first year) for every eighty acres of land. He will see, by comparing the quantity of land sold with the number of adult labourers who have been taken out, that this is a much higher proportion of labour to land than he can expect to meet with in the colony. If he take his money out with him, and purchase land there, he must be content

to scramble for labourers with those who have adopted the same course before him; and the derangement in the balance between labour and land which he has caused, cannot possibly be restored until his money shall have been sent to England and labour sent out with it—processes which will occupy at least a year. There is another matter worthy the attention of capitalists, and which will tend to the great advantage of early purchasers. The increase in the sale of land continues to advance in a much more rapid ratio than the increase in the exportation of labour. The commissioners have already once raised the price of land from twelve shillings to twenty shillings per acre, and at no very distant period it may fairly be presumed they will be compelled to raise it again—to restore that equilibrium in the elements of wealth, which is now becoming more and more deranged the farther they proceed. True, population continues to increase rapidly in the colony, and the lists of marriages and births in the South Australian papers are very satisfactory in a philosophical point of view; still, even supposing the population to double itself every twenty-five years,* the shortest period in which we believe it has ever been known to do so, it is questionable whether such increase will come nearly up to the demand. The mere raising the price of land will not be sufficient of itself to avert this impending evil. The colonization of Swan River, Port Philip, Port Essington, New Zealand, and Falkland Islands, on "the Wakefield principle," is creating and will create a vastly increased demand for emigrant labourers—the supply of whom, although not likely to be quickly exhausted in the present state of Great Britain, will yet be seriously subdivided by these new competing colonies. Even up to the present period this competition has been felt, and the difficulty in procuring eligible labouring emigrants is increasing daily. In addition, then, to raising the price of land, it will be necessary to adopt some comprehensive plan for the dissemination of authentic information respecting the colony, in order to increase the field of selection. The rural labourers are lamentably ignorant even of their own country, and are obliged to rely almost wholly on the advice of other persons, and are at present the prey and sport of nu-

* Twenty-five years is far too short a period to allow of the doubling of any population. In thirty years even the population of Ireland had not increased sixty-one per cent; and the English did not exceed fifty-five per cent. As for population doubling itself every fourteen years, the careless assertion commonly inculcated in elementary books, it is too absurd to need refutation.

merous "bounty" adventurers, each outbidding the other in flattering misrepresentations concerning the colonies in which these man-sharks are respectively interested. The illiterate rustic, confused and bewildered amidst the conflicting statements by which he is sought to be influenced, either recklessly consigns himself to the first that offers, or suspects the integrity of all, and remains at home, a burden on his parish, and a misery to himself. If proper means were taken to promulgate statistical and official information amongst our half-starving labourers—if a thorough revision were to take place of the list of selecting agents—if responsible persons were appointed to give information and receive applications periodically in given districts—the number of labourers who would seek information, and afterwards wish to emigrate, would, we believe, be found exceedingly great. The inspectors must, however, be persons officially accredited, or, as the labourers term it, "under government," on whose statements the labourers could implicitly rely; for they have neither time nor opportunity to inquire and judge for themselves. These inspectors should invite the parochial clergy to attend their meetings, and be ready to answer all questions and solve all difficulties which ignorance or prejudice might suggest. The field for selection which this plan would open up would be almost unlimited. Emigration would no longer be looked at as something allied to transportation, to which the sulky pauper had to be bribed; but the man who was selected would pride himself on the privilege, and strive to maintain the character which had earned it. He would go forth into the world cheered and invigorated, and in better heart to wrestle with the difficulties which he might encounter in his adopted land.

But the necessary limits of this paper warn us to recur to the inquiry, how far the experiment in South Australia may be said to have succeeded? and to what extent its success ought to modify preconceived notions respecting colonization?

Viewing the experiment as an attempt to "bridge over the ocean," and render the fertile regions of other climates approachable with facility to our superabundant labour and capital, as an essay at constructing a system by which the elements of wealth may be drawn together in the most favourable proportions for production—a system so elastic as to be susceptible of adjustment at will to the most various and comprehensive human circumstances,—its success has been as brilliant as that of any experiment on record. As if by the wand of a magician, a new town has been made to spring out of the earth;—the waters of the

Australian gulfs have been covered with ships, which have poured out their myriads of animals, human and inferior, to luxuriate, thrive, and fatten on the exuberant produce of previously unsubjugated wilds;—the "busy hum" of civilisation is borne upon the moist sea-breezes which prevail throughout the year, and startles the astonished savage in the very fastnesses of his woods; the great hand of human intellect has seized the country in its grasp; and every acre of the land, and every creek and river of the waters, acknowledges in its land-mark or its buoy the irresistible supremacy of mind. Who will despair over the destinies of our race, when the exertions of a few individuals can have set such mighty elements of human happiness in motion? The man who makes two blades of grass grow where one grew before has been eulogised as a benefactor to his species. What should be said of the men who have planted the germ of a new nation?

The details of the experiments have also evinced much wisdom, forethought, and vigilance. Of the numerous vessels burdened with precious human freight that have left our crowded shores, not one has met with any serious accident, and the average mortality of the emigrants has not exceeded that of the population on shore. Although, we believe, scarcely a loaf of bread has been grown in the provinces, bread has, during the late drought, been cheaper at Adelaide than at Sydney; and the inconvenience resulting from the first rush of capitalists having been surmounted, the surveys of land are now in advance of the purchasers. These results are indeed not less gratifying to the philanthropist than honourable to their promoters.

A theory involving interests and consequences of such great magnitude, can still scarcely be matured in three years and a half; and it reflects no discredit on those who have done so much when we assert that much remains to be accomplished. Every project has two classes of enemies—those who expect too little from it, and those who expect too much. In this project the first class has in a great measure been defeated, and the only danger now exists from the enthusiastic zeal of the latter class. The soundest friends of the new principle are those who contend that sufficient experience of its working has not been yet obtained, whereby can be laid down a positive and absolute scale of the proportions in which the elements of wealth can be most profitably combined. This consummation must be essentially a work of time; every step, however, has hitherto been part of a triumph—

ant progress towards it: but until this goal has been reached, the experiment must be considered incomplete. In the meantime the elasticity of the project, which has borne it over so many difficulties, may safely be relied on for carrying it through.

To what extent ought the success of this important experiment, as far as it has gone, to modify our previous views on colonization? Mr. Maculloch thus describes the old process of selecting the site of a colony.*

"The captain of a ship, without any knowledge whatever of the nature of soils, or the capacities of a country in an agricultural point of view, falls in, after a long cruise, with a river or bay, abounding with fish and fresh water, and surrounded with land which *looks* fertile, and is covered with herbage. He forthwith reports all these circumstances, duly embellished, to the Admiralty, strongly recommending the situation as an admirable one at which to found a colony; and in nine cases out of ten *this* is all the information that is required in taking a step of such infinite importance! No wonder, therefore, that many fine schemes of colonization should have ended only in loss and disappointment; and that situations which the colonists were taught to look upon as a species of paradise, have proved to be any thing *but what they were represented.*"

The establishment of the South Australian colony has been on a plan so very different from the above described, that in matters of detail it may be said to have created in colonization a complete revolution. Let us, however, consider the question in its most important points of view. It has been proved to demonstration that capital *will* flow into colonies where free labour is procurable for hire; that at one and the same time capitalists can gain high profits, and labourers gain high wages; that the value of colonial waste lands may be safely estimated by profit rather than by price; that savage natives may be tamed without indiscriminate slaughter; that a "model colony" can be established without the costly train of soldiers and *attachés* that had previously been thought indispensable; that a safety valve has been opened, which is equal to the relief, for many generations, of whatever pressure of redundant population may exist, or may be created by the brilliant emanations of human invention,—in which our age is so prolific,—that the outlines of a system have been traced, which, at some future time, aided, perhaps, by steam or galvanic navigation, may open up new sources of commercial enterprise, enlarged intelligence, and human enjoyment, and accelerate the approach of a millennium of benevolent, peaceful, and social intercourse

amongst the denizens of the most distant parts of the earth.

The latest accounts do not vary relative to the prosperity of the colony. We subjoin extracts from a letter of the most recent date received, December 20th, Adelaide. The writer, Mr. F. Worthington, is a gentleman of unquestionable respectability, and it is addressed to his family in this country. We think it right, on a subject to which the eyes of thousands in England are directed with the deepest interest, to subjoin unquestionable authority for our statements, and simply to trust to such persons as from their respectability and positive experience may not mislead. After a detail of the voyage, the writer's own expressions are verbatim:—"The town of Adelaide presents to your sight a number of shops, nearly as good as the middling London ones, and scattered on each side the road or street, in which you can obtain every necessary article or utensil." He then proceeds to state, and we here caution the small capitalist who is greatly deluded upon this point, "that sheep farming requires full £2000 to be invested in it, that the price of each sheep is £2, and that 500 would not offer in wool a remunerative produce for the expense of a shepherd to attend them in pasturage, pens, &c." Port Lincoln is next mentioned incidentally, and it appears to possess one of the finest harbours in the world, capable of containing 2000 sail of shipping in perfect safety, and will no doubt become the greatest maritime colony in South Australia. The land is rising immensely in value, and no doubt will ere long reach the price per acre of the one in Adelaide on which the writer resides, which was sold for £1 and now lets at £1600. We extract again the description of the country around Adelaide in the same writer's words.

"To look around you from my house, you might even imagine yourself in Greenwich park, so beautifully wooded is the country, with a sloping bank running down to the river Torrens in the foreground, a lofty chain of mountains in the background wooded to the summits. The trees are lined with parrots and small birds, and cows, sheep, and goats grazing in the plain. The whole, I assure you, forms a most beautiful landscape, such as any eye would delight to gaze on. This would be the country for you who like warmth, and here the glass stands in the shade at 94°, at the time I am writing. I should, were you and my dear mother only here, be the happiest man in the world, as I thank God I never felt better than I do, and health is certainly the prime desideratum."

In another part he continues as follows:—

"The country is certainly not exaggerated, and will feed sheep, cattle, pigs, poultry, horses, &c.

* Commercial Dictionary, 2d edit. p. 359.

beautifully, and would, with attention, grow every European and many of the Oriental fruits, flowers and vegetables. But the present resources of the country are certainly exaggerated, and the difficulty of obtaining good ground is great, and the capital required about eight times that represented as adequate. In fact, the whole prospects and actual situation of the colony are misrepresented in England, and were not the colony itself good, her too zealous and injudicious friends would actually ruin her by their false and over-coloured statements; for when I look around me, and compare the actual facts as they meet my view here, I actually doubt whether I am in South Australia, and its capital, Adelaide, so different is it from what it is described; and yet her friends in England have actually not stated all that might be said in her favour, but have exaggerated and told lies that could answer no purpose; whereas the truth would have been more favourable, and, if told, no dissatisfaction would have been felt by those persons who were misled by the lies told of the colony in England by her injudicious friends. Give my kindest love to all our friends, and tell them I do not regret coming out here, for it is certainly better than old England."

The above statements may be fully depended on; and, in addition, we think it right also to mention, that the English church will shortly assume an aspect in the colonies very different from what it has hitherto done; since episcopacy will exist in future at the commencement of the establishment of the church in these distant settlements instead of the terminus, as at present. The prelates of the English church have determined to place the establishment in all her ramifications throughout these widely extending regions; and the Society for the Promotion of Christian Knowledge, has, on the very day on which these observations are penned, at the earnest instance of the indefatigable Bishop of London, voted 10,000*l.* for colonial bishops; the Society for the Propagation of the Gospel also comes forward; the Church Missionary, still further, to aid the setting forth of our church in all its orders of bishops, priests, and deacons. And all these efforts at home we question not will be amply seconded in Southern Australia, for one of our colonies; since the governor, Colonel Gawler, is a most excellent and pious officer, and deeply attentive to both the temporal and spiritual interests of the colonists. There will now not only be chaplains, but bishops in the foreign settlements; not an isolated individual member of the church, possibly of feeble mind and inadequate powers, but the church in a catholic sense, with all its members.

South Australia, which has already shot forth into the very van of civilisation, an armed Minerva springing fully equipped from the brain of her parent, will be divested of all noxious power, and exercise her functions in meekness of wisdom. It was six years

before a church sprung up in New South Wales; but one is already built in South Australia, and a bishop will, we have no doubt, be chosen for this especial country, equal to England in extent, and now containing in emigrants alone, not including a single capitalist, full 15,000, with a yearly increase, if we take 1839 for example, of 5800. To prevent the hideous demoralisation of Sidney, so easily to be accounted for from a want of efficient pastoral superintendence,—to check the fatal truth of what is sadly realised in one nation, which is "*pouri avant d'être mur,*" must be our effort. Nor are the helpless aborigines to be lost sight of; for if we have taken their country, the least we can do is to better their condition at the same time that we are bettering our own at their expense, and if we take from them their kingdom on earth, to enrich them with a far nobler in heaven.

This age is full of the seeds of things, and we trust that it will not sow sparingly from them, either at home or abroad; and that we shall see Australian wilds giving forth, not simply gain in the shape of wealth, but a visible intellectual advance, a growth of mind as well as matter, a cosmopolitan enlargement; and that the southern cross shall match in brilliancy in its own hemisphere the northern constellations, and the present unequally balanced condition of the world gain that just preponderance by which the increase of the south may be as the north, and not remain, like its pole, chilled in the ice of centuries in deadly torpor to all wholesome animation.

ART. VIII.—*The Last Days of a Condemned. From the French of M. Victor Hugo. With Observations on Capital Punishment.* By Sir P. Hesketh Fleetwood, Bart. M.P. London: Smith, Elder and Co. 1840.

THE punishment of crime is a subject that demands the gravest attention on the part of mankind. It is a matter of extreme difficulty, we freely admit, to appoint such punishment as may ensure the protection of society, and also arrest the progress of vice. There are many crimes that men commit, for which they may atone in after-life, even to the person whom they have injured. But no compensation can afterwards be rendered back for the loss of life,—for plunging our fellow-creature into futurity unprepared, for taking away that which we cannot restore. Sir Hesketh Fleetwood in the above

little volume has declared himself in favour of the opinion, that capital punishment, even in cases of murder, should entirely be done away with; and we certainly approve the merciful tendency of his observations, and the benevolent feelings, however mistaken in some points, which have induced him to lay his ideas upon this important subject before the public.

As to the propriety of the unreserved abolition of capital punishment which Sir Hesketh advocates, we are inclined to think that his amiable feelings have led him to place the subject before his readers in a false point of view. His argument against that "*dictum probans*" "*Whoso sheddeth man's blood, by man shall his blood be shed,*" however benevolent, is yet weak. The literal force cannot be eluded. Moses expressly marks the *wilful* shedder of blood, distinguishing between manslaughter and murder. *Numbers*, xxxv, 18, "The murderer shall surely be put to death." *Ibid.* 32, "*Ye shall take no satisfaction for the life of any murderer which is guilty of death, but he shall surely be put to death.*" But Sir Hesketh will argue, Christ repealed portions of the Mosaic law, therefore that law is imperfect. Christ did not repeal this. Nothing can be more positive than the passage. The murderer's aim is at life—his quest the death of this life. God demands from the reeking hand the life-blood there—his own life-blood for that life-blood, "the blood is the life." And surely Sir H. Fleetwood cannot but recall those numerous instances of capital punishment, as Samuel hewing Agag in pieces, in corroboration of this view.

Sir Hesketh proceeds—"If we search the New Testament we shall find no passage under the new dispensation, that can be construed to call for the infliction of death for murder." We shall not press the opinion of the penitent thief—"Dost not thou fear God, seeing thou art in the same condemnation; and we indeed justly, for we receive the due reward of our deeds"—confirmed as that testimony is, by the unique confession of all malefactors, that the murderer deserves his doom. Still here was one for a *minor* offence owning his condemnation just, with little of the life in this world remaining, with the judgment cleared up in a most wonderful manner so as to enable him to pierce through the veil of suffering, and trace in the criminal of earth, the Crucified beside him, the Lord of Glory. But we will not press this strong position, but pass to another "*dictum probans*;" *Rev.* xiii. 10, "He that *kilieth with the sword* must be *killed by the sword.*"

Again, *Romans* xiii. 4, "If thou do that which is evil be afraid, for he (the ruler) beareth not the *sword in vain*, for he is the minister of God, a revenger to execute wrath upon him that doeth evil." Here the word *sword* clearly intimates capital punishment. As for example in the celebrated decree against Cyprian—"Thascium Cyprianum *gladio* animadverti placet;" "It is our decree that Thascius Cyprian be beheaded by the sword." Neither does the argument in question draw any force from the Redeemer, the Giver of Life, condemning no man. "He came not into the world to condemn the world, but to save the world." As its ultimate Judge in eternity, He did not exercise judgment over it in time. But He did not contradict the great moral law of Moses under this head, but added to it stronger sanction. Moses held over the heads of his people the dread of temporal punishment, but the Christ with this added the deeper terrors of eternal pain. *Matthew*, v. 21, 22, "Ye have heard that it was said by them of old time, *Thou shalt not kill*; and whosoever shall kill *shall be in danger of the judgment*. But I say unto you, that whosoever shall be angry with his brother without a cause shall be in danger of the judgment; and whosoever shall say to his brother '*Raca,*' shall be in danger of the council; but whoever shall say '*Thou fool,*' shall be in *danger of hell fire.*" Christ then grounded his appeal to holiness on mightier than temporal issues. The argument as to the irreparable loss of life amounts to but little, since the Apostle Peter punished capitally in the instance of Ananias and Sapphira; a still further argument for capital punishment, since they were *death stricken* for a simple evasion of a question. The argument also on the cases of Cain and David is of very slight importance. Cain was not sentenced to death for the act of murder, nor David for the meditation of it; God not man being the judge in each instance. Cain we think an unfair instance for quotation. He had never seen death, he had heard no penalties denounced against its commission, he had not sinned against a written law, though an offender against what God has engraved on the tablets of the heart. It was probably also requisite that the first murderer should be *branded* for the benefit of all posterity, that the instance should be *marked*, and that the one among the living three who was a murderer should be punished by God exiling him from any visible communion with himself—a token here of a to-come hereafter. And surely *death*, compared to this lodement of futurity and the murderer's mark in life, had been a weaker punishment; all shun-

ning the primal homicide, the foul fratricide, the God-blasted Cain sealed with the signet of the wrath of heaven. This instance, where *God is Judge*, cannot be argued on at all, since man is not God, nor his ways God's ways. Death, it is expressly stated, was the penalty in the case of David; but a prophet of God announced to him that he should *not die*. But the signs of it were on all around him, to sadden his soul and grieve his heart; death was denounced on the child of adultery; death followed on Absalom, when the aged king exclaimed—"Would God, I HAD DIED with thee, Absalom, my son, my son!" The sword never left his house, and the temple of God was not reared by the man of blood. Here, again, God was the Judge, the agency especial and peculiar, the general law not holding, but the individual exception. Neither of these instances therefore in any form negatives capital punishment. So clear has the general authority on this matter always appeared, that the Committee on the criminal laws pointedly stated, in the very front of their Report, their fixed opinion on this subject. "They wish expressly to disclaim all doubt of the right of the legislature to inflict the punishment of death wherever that punishment, and that alone, seems capable of protecting the community from enormous and atrocious crimes." Mighty have been the names for a merciful amelioration of the penal statute; and we rejoice in the punishment of death being repealed in numerous instances. More, Erasmus, Bacon, and Coke all advocated milder laws, but did not advise the total cessation of capital punishment. They felt that laws made stronger than the enforcement of them—laws suspended over large classes of offenders, and only affecting a few individuals out of a great mass, are bad and inefficacious in the suppression of crime. But beyond the line drawn out by the Commissioners on the Criminal Laws we are not disposed to venture. They particularize eight species of crime, to each of which they adjudge the penalty of death:—

1. High treason.
2. Murder.
3. Attempt to murder with actual injury to the person, to be particularly defined.
4. Burning of buildings or ships.
5. Piracy.
6. Burglary, with cruelty.
7. Robbery, with ill-usage.
8. Rape.

We are prepared to go to this extent in suppression of the punishment of death, and no further. We know that it is idle to look for the suppression of crime; for even Thucydides tells us in the celebrated oration of Diodotus—

"They have it by nature, both men and cities,

to commit offences, nor is there any law that can prevent it. For men have gone over all degrees of punishment, augmenting them still, in hope to be less annoyed by malefactors; and it is likely that gentler punishments were inflicted of old even upon the most heinous crimes, but that in tract of time men continuing to transgress, they were extended afterwards to the taking away of life, and yet they still transgress. And therefore either some *greater terror than death* must be devised, or death will not be enough for coercion."

No doubt of it. Even death, which men fear most, will not suppress crime, but it will prove the strongest check. Physicians cannot stay all maladies, but they arrest the progress of some. Should we then argue that they are useless in the treatment of disease? Tuscany gave up capital punishments, *but is resorting to them again*. Catherine of Russia did the same, but still administered the "knout without reserve." The *carcere duro* and the *carcere durissimo*, (if we attended to Andryane,) the tender mercies of Spielberg, are many deaths, and are obviously borrowed from Beccaria, or some analogous system.

"Non è l'intenzione della pena che fa il maggior effetto sull' animo umano, ma l'estenzione di essa; —non è il terribile ma passeggero spettacolo della morte di uno scelerato, ma il lungo e stentato esempio di un' uomo privo di libertà che divenuto bestia di servizio ricompensa colle sue fatiche quella società che ha offeso, che è il freno più forte contro i delitti."

Compared to this who would not die; and experience shows solitary confinement produces madness, and the choice of even death in preference. Mr. Miller, the distinguished author of the "Inquiry into the Criminal Law," mentions that he himself saw a man led to execution in Austria on his own confession of guilt, which was requisite to convict him of murder, after he had tasted two years of Austrian solitary imprisonment. And to such an extent has conscience urged the hidden lash in several instances, that men have surrendered themselves to capital punishment rather than bear the "peine dure et forte" of inward meditation on guilt, of solitary confinement of thought in their own bosom; and it comes to that, though the body be at liberty.

Sir Hesketh gives us an extract from the Morning Herald on the Returns connected with the subject of capital punishment, made before the House of Commons on the motion of Mr. Ewart. These are divided into two classes.

"First class—a return of the number of persons sentenced to death for *murder* in the year 1834, whose punishment was *commuted*, specifying the counties in which these crimes occurred, and stating

the number of *commitments* for murder in the same counties during the same year and the following year, together with the *increase or diminution of commitments* for murder in the same counties in the year following the commutation of the sentences; similar returns for 1835, 1836, 1837, and 1838.

"Second class—A return of the number of *executions* which took place in England and Wales during the three years ending the 31st day of December, 1836, and also during the three years ending the 31st of December, 1839, together with the number of *commitments* in each of those periods respectively for offences *capital*, on the 2d day of January, 1834. Also the total number of *convictions* for the same offences, together with the *centesimal proportions of convictions to commitments* in each of those periods respectively."

The result of these facts obtained from the several counties are as follows:—

"Looking to the tables of *executions*, we find that in the *three years* ending the 31st of December, 1836, the number *executed* was 85; while during the *three years* ending the 31st of December, 1839, the number was only 25. The *commitments* in the former period were 3104, in the latter 2989; showing a decrease, though a small one, in the number of *commitments*, while there is exhibited an *increase* in the number of *convictions*—viz. from 1536 to 1788, showing the *centesimal proportions of convictions to commitments* in the two periods to be represented by the figures 49·48 and 59·48, respectively."

But these returns extend over far too small a space of time to constitute a just criterion; and many other local and general influences, such as the increased education of the rising generation, are to be taken into calculation in the consideration of this question.

"Once grant an exception," says the author, "to execution, once admit the doctrine of reprieve, and the authority as a command in the Bible ceases altogether." We do not exactly see the truth of this assertion. A reprieve is generally the result of a more mature deliberation on the case of the criminal, where the circumstances are probably ambiguous. Most anxious should we be to seize any opportunity to relieve ourselves from the awful responsibility of condemning a fellow man to death. This does not give an "exception" to execution, for where the facts are clearly proved, the just penalty of the law is executed.

The narrow limits, however, to which we are obliged to confine ourselves, will not allow us to enter deeply into this important question on the present occasion, and we therefore turn the more willingly from the lucubrations of the worthy baronet, to the more pleasing task of accompanying him through the interesting narrative which he has given to the English public, in a manner equally creditable to his talents and his heart. Although this, as well as other productions

of Victor Hugo, cannot be unknown to the majority of our readers, still as "The Last Days of a Condemned" bid fair henceforth to assume a place in English literature, we shall not hesitate, even at the risk of telling a twice told tale, to give to our readers a short analysis of the work, previous to the introduction of the passages we shall select as specimens of the spirited manner in which Sir Hesketh Fleetwood has executed his self-imposed task of clothing this singular production in an English dress.

The work consists of a series of papers, supposed to be the daily writings during six weeks of a condemned criminal, confined for that period in the Bicêtre previous to his execution. These present to us a powerful picture of the hopeless despair of one who is condemned to expiate his sins upon the scaffold. The words "condemned to death" haunt the wretched man as spectral apparitions. The joyous beams of the sun darting through his prison window, the merry laughter from the flower market beneath, awaken only bitter and overwhelming reflections of the irrevocable past. This mental punishment is increased by continually reading on the walls of his dungeon the various names of criminals who had expiated their sins before him. He involuntarily recollects the appalling crimes they have committed. To his diseased imagination their names appear written in flames of fire upon the wall, their spectre forms crowd around him, all raising their right hand, as if in denunciation against him, excepting one who was a *parricide*.* He is nearly fainting with horror, and is recalled to animation by something cold crawling over his naked foot. It was a bloated spider! We give in the words of the translator the powerful scene of the galley slaves departing for Toulon:—

"At twelve o'clock a large gateway in the court was opened. A cart, escorted by soldiers, rolled heavily into the court, with a rattling of irons—it was the convict-guard with the chains. At the same instant, as if this sound awakened all the noise of the prison, the spectators of the windows, who had hitherto been silent and motionless, burst forth into cries of joy, songs, menaces, and imprecations mixed with hoarse laughter. It was like witnessing a masque of demons, each visage bore a grimace, every hand was thrust through the bars, their voices yelled, their eyes flashed, and I was startled to see so many gleams amidst these ashes. Meanwhile the galley sergeants quietly began their work—one mounted on the cart and threw to his comrades the fetters, the iron collars, and the linen clothing, while others stretched long chains to the end of the court, and the captain tried each link by striking it on the pavement, all of which took place under the mocking railery of the prisoners, and the loud laughter of the convicts

* In France a parricide has his right hand taken off previous to his execution.

for whom they were being prepared. When all was ready, two or three low doors poured forth into the court a collection of hideous yelling ragged men; these were the galley slaves. Their entry causing increased pleasure at the windows—some of them, being ‘*great names*’ among their comrades, were saluted with applause and acclamation, which they received with a sort of proud modesty. Several wore a kind of hat of prison straw, plaited by themselves, and formed into some fantastic shape; these men were always the most applauded. * * * * * While they were exchanging their worn out prison garments for the thin and coarse clothing of the galleys, the weather which had been hitherto uncertain, became suddenly cold and cloudy, and a heavy shower chilled their thin forms and saturated their vesture. A dull silence succeeded to their noisy bravadoes; they shivered, their teeth chattered, and their limbs shook in the wet clothes. One convict only, an old man, retained a sort of gaiety; he exclaimed, laughing, while wiping away the rain, and shaking his fist at the skies, ‘*this was not in the play bill!*’ When they had put on their miserable vestments, they were taken in bands of twenty or thirty to the corner of the court where the long chains were extended. At every interval of two feet in these long chains were fastened short transverse chains, and at the extremity of each of the latter was attached a square collar, which opened by means of a hinge in the centre, and closed by an iron bolt which is rivetted for the whole journey on the convict’s neck. The convicts were ordered to sit down in the mud on the inundated pavement; and the iron collars were fitted on them, and two prison blacksmiths, with portable anvils, rivetted the hard unheated metal with heavy iron hammers. This was a frightful operation, and even the most hardy turned pale! Each stroke of the hammer aimed on the anvil resting on their backs makes the whole form yield;—the failure of its aim, or the least movement of the head might launch them into eternity. When this operation was finished the convicts rose simultaneously. The five gangs joined hands, so as to form an immense circle, and thus ran round and round in the court, with a rapidity that the eye could hardly follow. They sang some couplets in their own idiom to a melody which was sometimes plaintive, sometimes furious, often interrupted by hoarse cries and broken laughter, like delirious raving; while the chains clanking together in cadence formed an accompaniment to a song more harsh than their own noise. A large trough was now brought in; the guards striking the convicts to make them discontinue their dance, took them to the trough, in which was swimming I know not what sort of herbs in some smoking and dirty-looking liquid. Having partaken of it they threw the remainder on the pavement, with their black bread, and began again to dance and sing. This is a liberty which is allowed them on the day they are fettered and the succeeding night. I gazed on this strange spectacle with such eager and breathless attention that I totally forgot my own misery. The deepest pity filled my heart, and their laughter made me weep. Suddenly, in the midst of a profound revery into which I had fallen, I observed the yelling circle had stopped and was silent—then every eye was turned to the window which I occupied, ‘*the condemned! the condemned!*’ shouted they, pointing their finger at me, and their bursts of laughter were redoubled.” * * * * * “The window looked into the large court of the Bicêtre, which was full of people. Two lines of veterans had difficulty in keeping the crowd away from a narrow passage across the court. Between this double rank of soldiers, five long wagons loaded with men were driven slowly, jolting at each stone; it was the departure of the convicts. These wagons were open, and each gang occupied one. The convicts, in con-

sequence of these iron collars being attached to the centre chain, are obliged to sit back to back, their feet hanging over the sides of the wagon: the centre chain stretched the whole length of the cart, and on its unfastened end, the serjeant stood with his loaded musket. There was a continual clanking of the prisoners’ chains, and at each plunge of the wagon their heads and pendant limbs were jolted violently. A quick penetrating rain chilled the air, and made their wet slight vesture cling to their shivering forms. Their long beards and short hair streamed with wet; their complexions were saturnine, they were shivering and grinding their teeth with mingled rage and cold! But they had no power of moving—once rivetted to that chain, each becomes a mere fraction of that hideous whole which is called the Gang. Intellect must abdicate, the fetters condemn it to death, and the mere animal must not even hunger but at certain hours. Thus fixed, the greater part half clad, with bare heads, and no rest for their feet, they begin their journey of twenty-five days; the same sort of wagons, the same portion of dress being used in scorching July as in the cold rains of November. One would almost think that man wishes heaven to take a part in his office of executioner. Between the crowd and the convicts a horrible dialogue was maintained; abuse on one side, bravados on the other, imprecations from both; but at a sign from the captain, I saw the sticks of the guard raining indiscriminate blows into the wagon on heads and shoulders, and all returned to that kind of external calm which is called ‘*order.*’ But their eyes were full of vengeance, and their powerless hands were clenched on their knees. The five wagons, escorted by mounted gendarmes and guards on foot, passed slowly under the high arched door of the Bicêtre. The crowd followed them; all vanished like a phantasmagoria, and by degrees the sounds diminished of the heavy wheels, clanking fetters, and the yells of the multitude uttering maledictions on the journey of the convicts; and such was their happy beginning.”

His reflections on the blighting influence of a prison upon the young and hitherto slightly tainted mind are very beautiful. He is removed to another prison and is there confined with a noted criminal, who gives him a striking history of his life. He has an interview with the priest of the prison, inured to the contemplation of the varied influences of crime over the human breast, his ministrations give him but little consolation from the cold and methodical manner in which he performs his spiritual duties. He sighs for one whose ministry has given consolation to the sick and weary hearted, to the calm and peaceful deathbed, for one whose spiritual energies would be aroused by the appalling situation of a man condemned to suffer a violent death, whose energetic and heartfelt prayers to the Creator would secure the peace and redemption of his soul. Towards the last day the chimes of the distant belfry fall upon his shuddering ear. He looks back upon his crime with redoubled horror. He must die in a few short hours, and he remembers that a year ago he was innocent and at liberty, wandering through the fresh fields and waving grass. His last interview with his little child,

who adds to his grief by not remembering him, is exquisitely described, nor has it lost any portion of its touching beauty in the hand of the translator.

"My child looked rosy and happy, and her large eyes were bright—oh! she is so pretty! I drew her towards me, I raised her in my arms, and placing her on my knees, kissed her dear hair. I asked, 'why is her mother not with her?' and I learnt that she was very ill, and my poor old mother also. Mary looked at me with astonishment. Caressed, embraced, devoured with kisses, she submitted quietly; but, from time to time, cast an uneasy look towards her nurse, who was crying in the corner. At length I was able to speak. 'Mary,' I exclaimed, 'my own little Mary!' and I pressed her violently against my breast, which was heaving with sobs. She uttered a little cry and then said, 'oh! you hurt me, sir.' 'Sir!' it is nearly a year since she has seen me, poor child! She has forgotten me,—face, words, voice; and then who could know me with this beard, this dress, and this pallor? What! already effaced from that memory, the only one where I wished to survive! What! already no longer a father, am I condemned to hear no more that word, so soft in the language of children that it cannot remain in the language of men, 'papa.' And yet to have heard it from that sweet mouth once more, only once more, that is all I would have asked in payment for the forty years of life they will take from me. 'Listen, Mary,' said I to her, joining her two little hands in mine. 'Do you not know me?' She looked at me with her bright beautiful eyes, and answered, 'oh! no, indeed.' 'Look at me well,' I repeated, 'what! dost thou not know who I am?' 'Yes, sir,' she answered, 'you are a gentleman.' Alas! while loving one being on earth, loving with all your deep affections, having that being before you, who sees and looks at you, speaks and answers you, and yet knows you not; you wish for consolation but from this one being, who is the only one that does not know that you require it because you are going to die! 'Mary,' I continued, 'hast thou a papa?' 'Yes, sir,' said the child. 'Well then, dearest, where is he?' She raised her large eyes in astonishment; 'ah, you don't know, sir, papa is dead;' here she began to cry; I nearly let the little angel fall. 'Dead!' I exclaimed, 'Mary, knowest thou what it is to be dead?' 'Yes, sir,' she answered, 'he is in earth and in heaven.' And she continued of her own accord, 'I pray to God for him morning and evening at mamma's knees.' I kissed her on the forehead—'Mary, say to me thy prayers.' 'I could not, sir; a prayer you do not say in the middle of the day. Come to-night to my house and you shall hear me say it.' This was enough, I interrupted her. 'Darling Mary, it is I who am thy papa.' 'You!' returned she. I added, 'wouldst thou like me for thy papa?' The child turned away; 'No, sir, my papa was much prettier.' I covered her with kisses and tears. She tried to escape from my arms, crying—'sir, you hurt me with your beard.' Then I replaced her on my knees, devouring her with my eyes, and continued, 'Mary, canst thou read?' 'Yes,' she answered, 'I can read very well. Mamma makes me read my letters.' 'Well then read a little to me,' said I, pointing to a printed paper which she held crumpled in one of her dimpled hands. She shook her pretty head, saying, 'oh! dear me I can only read fables.' 'But, try, my darling; come open your paper.' She unfolded the paper, and began to spell with her fingers, 'SEN—sen—TENCE—tence—Sentence.' I snatched it from her hands. It was my own sentence of death she was reading to me. Her nurse had bought the paper for a penny. To me it had cost more. No words can convey

what I felt; my violence had alarmed the child, who was ready to cry—suddenly she said to me, 'do give me back my paper, I want to play with it.' I restored her to her nurse. 'Take her hence.' And I fell back in my chair, gloomy, desolate, in despair. Now they may come, I care for nothing more, the last fibre of my heart is broken."

The hour at last arrives, the appalling ceremony commences, the toilet of the condemned begins, they remove his coat and waistcoat for the purpose of cutting off his hair, so that the axe may not be impeded in its duty. The cold steel touches his neck, and a thrill of horror runs through his frame, a sea of heads appears to his bewildered eyes, a thousand voices greet him, he is on the scaffold, he has a confused idea that his pardon may arrive, he prays but for five minutes' mercy, only five minutes more! the last words are "hark! I hear some one coming up stairs." * * * "4 o'clock."

We must so far depart from our resolution of confining ourselves wholly to the merits of this work in merely a literary point of view, as to cite some of Sir Hesketh Fleetwood's remarks on the influence of poverty in producing crime.

"In the phrase 'my poverty but not my will consented,' let me not be understood to speak of poverty merely in the light of want of money; that is a very narrow view, and very confined as to what forms the real pains of poverty. Poverty is the want of means, intellectual and moral, as well as pecuniary, to feed the being who is placed on the area of the world; with mind active as well as body, sustenance is necessary to its existence; if the poor man cannot obtain bread, he takes gin to assuage cravings of the stomach; no less, if the mind cannot obtain light, to guide it on the onward path, the visual organs become habituated to the dark and murky gloom of almost darkness, and through their confused gleamings, no wonder if the being fall into the pits and whirlpools which beset with danger the pathway of man, even when blessed with the clear light of day; how much more, therefore, when he has not light to discern good from evil, nor an intellectual poor-law to supply him with food when a beggar by the way side of knowledge! How strange it is that we can incarcerate the *bodies* of the poor because they are poor, objecting to let them be dependent on casual charity for bodily sustenance, and yet cannot be equally strict in legislating for the mind. * * * * The poverty of the mind, if relieved, will probably be a permanent good; whereas bodily relief is at best but temporary. How vast, too, is the effect of knowledge on the creation of food; knowledge teaches industry; knowledge and industry multiply an hundred fold the product of labour; comfort and security are thus increased; idleness, and consequently crime, is diminished, for a man of information is seldom idle; and one surrounded with comforts, is rarely inclined to commit crimes against society."

There can be no question that it is one of the most important duties of the legislature, to provide for the intellectual improvement of the lower classes, as the most efficient means of diminishing crime. That, notwithstanding the many efforts to produce this de-

sirable object, but little, comparatively speaking, has yet been effected, is a melancholy truth unfortunately but too self-evident—at the same time we may be allowed to observe en passant, that Sir Hesketh a little wanders in the subsequent part from the proposition which he lays down at the commencement of the passage just quoted. He invalidates the true and forcible statement he first gives of the strong temptation to crime produced by physical destitution, and his just inference therefrom, that the criminal is in consequence more an object for pity than condemnation, by proceeding to represent mental ignorance as constituting what he calls “the real pains of poverty.” We are far from wishing to be understood as not appreciating, as deeply as any advocate for public instruction could wish, the immense importance of education to the lower classes, without which we are convinced that no government can hope to realize real or permanent benefits to the population. We merely wish to point out to the author the inconsistency of his reasoning, and we have no doubt that he will be more careful in the arrangement of his matter upon another occasion of appearing before the public. We quite agree in the concluding observations of Sir Hesketh, that

“Punishment when strained beyond what is necessary, becomes revenge; punishment also should never exceed, but rather be milder than public opinion. In the awful decision of death more especially we should be careful not to inflict a penalty which we cannot repay back to the sufferer, if the condemnation should afterwards prove to have been erroneous. There can be no recall from the grave; in the beautiful words of our author ‘the door of the tomb opens not inwards.’”

All must wish that the punishment of death could be abolished, but of this we see no probability, since, if it were, we should soon rue that concession to the false reasoning of a Bulwer and a Victor Hugo, and retrace our steps like Tuscany. Victor Hugo brings forward many energetic arguments, but even under modern circumstances we cannot agree with his views. Certainly in former times there were many and dreadful abuses in public executions, but more so in France than in England.

We can also conceive a considerable portion of horror being experienced by Victor Hugo and sensitive minded men from the terrible manner in which capital punishment has often been inflicted. Victor Hugo gives some dreadful examples. But he omits the most dreadful instance in our recollection in France. A man and his wife were to be guillotined for murder. The man suffered the sentence first, and while his head was in the basin his wife was next placed beneath

the instrument, to suffer the same awful penalty. At the sight of her husband’s severed head, which she instantly recognized beneath her, the woman gave one of those deep and agonizing shrieks, that it is fortunate we hear but rarely, for their sound is almost like the blast of death. Her sensation was but momentary, but

“Gathered in that drop of time
A life of pain, an age of crime.”

To have forced any living being to endure that more than mortal agony we own was infamous. The sensation, that with that dis-severed head an instant would suffice to place her own; the awful questioning between death and life, to which her midway position led; the ghastly combination of death and life to which she was fast approaching, we freely own that such needless suffering ought not to be inflicted on mortality, and totally differ from the system of punishment laid down by Beccaria. This may have tended to have influenced the energetic mind of Victor Hugo: his ideas show great benevolence and philanthropy. But let us hope that religion and civilisation are gaining ground in all countries. We would gladly echo the words of Victor Hugo, “Tyranny has departed.” The precepts of Christianity in their original purity will, we trust, be eventually acted upon, to the promotion of universal justice. Education will advance and will improve the moral and physical condition of the lower classes, and truly happy will distant nations feel, should the time ever come when they will be no longer called on to execute the solemn judgment, “he who sheddeth man’s blood, by man shall his blood be shed.”

ART. IX.—*Histoire de l’Art moderne en Allemagne.* Par le Comte A. Raczynski. Tom. II. 4to. pp. 677. Paris. 1839.

WE have already given an account of this interesting work relating principally to the schools of Berlin and Dusseldorf, and generally to the recent revival of art in Germany, an event which has excited but little attention in this country, and indeed may be said to be hardly known in its causes and consequences. The present volume treats of the same general subject, and also particularly of the schools of Munich, Stuttgart, Nuremberg, Augsburg, Ratisbon, Carlsruhe, Prague and Vienna. It comprises a complete account of the recent progress and present state of architecture, sculpture, and painting in these different capitals.

It is preceded by an introduction containing the literary history of the Nibelungenlied and the other romantic poetry of Germany's heroic age, from which have been taken some of the principal subjects of the artistic creations formed under the patronage of the present king of Bavaria. The reign of the Hohenstaufen emperors—1138—1268—is the most glorious epoch of the middle age in Germany. In the midst of their deadly feuds with the Guelphs, this noble race of heroes patronised and cultivated the arts and sciences which had sprung into new life from the ruins of ancient civilisation. The brilliant and stirring epoch of the Crusades brought the East and the West into contact, and the fruits of this intercourse are attested in numerous monuments of architecture, sculpture, and painting, scattered over Germany, transporting us back to the camps, the courts, and the religious festivals in which the Hohenstaufen appear as the prominent figures on this splendid scene.

The poetical productions of this epoch may be divided into three distinct parts: those which have a common character with the Eddaic lays of Scandinavia; those which have borrowed their substance and form from the Romanz poetry; and those which are purely Teutonic in their origin, spirit, and character. The first possess an eminently epic character: they have also a national character, but of that remote nationality which confounds the German race with the other branch of the great Gothic family—the Scandinavians—and which belongs to the bloody period of the Northern mythology. Among these may be reckoned the Nibelungenlied and the other lays of which Theodoric King of the Goths is the hero. The second are of a complex nature, being however mainly derived from the Romanz or Provençal poetry, among which may be reckoned *Parcival*, *Tristan*, and the chivalric songs of Wolfram von Eschenbach. The third are purely national, and exclusively appropriated to the age of the Hohenstaufen. Such are the lyric and patriotic songs of Walter von der Vogelweide. These last have no relation to the Romanz poetry, except what concerns their external form.

The poetical literature of this glorious period sprung from the traditions relating to the times of the Nibelungen and Attila, from the lays of the Edda and the other productions of the Skaldic muse. So also the inspirations of modern art at Munich have been mainly derived from the recollections of ancient national glory, of the age of chivalry, and of warm religious faith. The

German Nibenlungenlied, in its present form at least, is much less ancient than the Scandinavian. It is also much less rude and energetic. It is refined by Christianity and chivalry, both of which were unknown to the ancient Skalds. Its external form has been borrowed from the Romanz poetry, and it may be considered as the commencement of German poetry which has since attained such perfection. The reaction in favour of the romantic school in Germany must be attributed to this source. The lays of the Nibelungs are for the modern Germans what the Homeric poems were for the ancient Greeks. They embody the oldest traditions of the heroic age. To Schnorr was reserved the glory of publishing the Nibelungenlied in a language—that of painting—common to all nations, in a series of frescoes which decorate the walls of the royal palace at Munich. Previous to commencing this great work, he had painted in oil a smaller picture, which is now in the collection of Count Raczynski at Berlin. It represents the bard of the Nibelungen seated between two allegorical figures, Poetry and History (*die Mahre und die Saga*), and forms also the subject of the first of the series of frescos taken from this poem. This series, like the poem itself, is divided into three principal parts:—the life and adventures of Sigfried, his death, and the revenge of Chriemhild. The execution of this grand conception has not escaped the cavils of criticism, embittered by party spirit and envy; the details of the composition and the figures may not always respond to the preconceptions the spectator may have formed of the scene and characters intended to be portrayed: but the general effect of the whole is worthy of the noble epic from which it is derived.

Another series of paintings in fresco, by Gassen, adorns the walls of the queen's ante-chamber at Munich, the subjects of which are taken from the life and works of Walter von Vogelweide. This poet, one of the earliest and most famous of the Minnesänger, flourished during the reign of the Emperor Frederick II. of the Hohenstaufen line. The most remarkable picture in this room is that painted on the ceiling, representing Walter at the famous poetical tournament or trial of skill at the Wantburg, in the year 1286. This celebrated scene is described in an illuminated painting in the magnificent MS. collection of the German Minnesänger in the royal library at Paris. This ancient picture has been copied in a wood engraving by Unzelmann, prefixed to the second volume of Professor von der Hagen's edition of the *Minnesänger*. Gassen has not servilely followed this ancient com-

position, although he appears to have borrowed some of its details, as characteristic of the times. Walter is represented in the attitude of a conqueror crowned with laurel before the princely pair, whilst Osterdingen, his vanquished rival, seeks the protection of the enchanter Klincksor against that ignominious death which was to be the penalty of defeat in this mortal strife. On the right sit the judges of the field; on the left stands the executioner, holding in his hand the fatal cord; and in the back ground is grouped the crowd of courtly spectators. The minstrel is also represented in various other scenes of his adventurous and courtly life, with that grace and softness which mark the works of this artist. The last of this series represents the tomb of Walter, as it formerly existed at Wursburg. The choristers of the church scatter seeds on the monumental statue of the poet lying in a recumbent posture, which are gathered by the birds invited to this feast, according to the legend, referring to his testamentary disposition, which ordained that they should be fed in this manner at his tomb. This beautiful idea is expressed with admirable simplicity and grace in the fresco of Gassen.

The present King of Bavaria, when prince royal, had conceived the idea of erecting a sort of pantheon or temple consecrated to German genius and patriotism. On his way to join the army of Napoleon in Poland, in 1807, he had a conference at Berlin with Johannes von Muller on this project, the execution of which was actually commenced by an order to the sculptor Schadow for several busts of German heroes and authors. On the liberation of Germany from the French yoke, in 1814, the design was resumed, and the plan of the architect Klenze was adopted for the construction of the Walhalla, the building of which was commenced in 1820. During the interval between these two epochs, orders were given to Wagner, at Rome, for the bas-reliefs to ornament the frieze, intended to represent the primitive history of the German nation; to Rauch, at Berlin, for six winged victories; and to Schwanthaler, at Munich, for other sculptures, which have been since executed. This monumental edifice is erected about a league from Ratisbon, on the brow of a steep hill, the base of which is washed by the Danube. It is in the form of a parallelogram, 300 feet long at its base, 100 feet wide, and 75 feet in height. It is built of white marble of Salzburg, the lateral walls of the interior being adorned with 150 busts of illustrious Germans of various epochs.

Among the architectural constructions of

King Louis at Munich, the Glyptothek is destined to receive the collection of works of ancient sculpture, which is arranged in chronological order in a suite of magnificent apartments, separated in the centre by two square rooms, which are adorned with frescoes by Cornelius. This rich collection was formed by purchases made at Rome, of objects remaining in the palaces of the former electors of Bavaria, and of others excavated at the King's expense in Greece, Italy, and Germany. The frescoes of Cornelius are the most successful attempt to revive this branch of art which has recently been made. The Pinacothek contains the immense collection of pictures belonging to the king, the productions of each school being arranged in separate rooms. Opposite to the cabinets containing the smaller pictures, a gallery runs along the whole length of that part of the building, divided into twenty-five *loggi*, each of which is painted in fresco on the ceiling and sides with a history of the arts, from designs drawn by Cornelius. The greater part of the cartoons and some of the paintings were executed by Zimmermann, or by other artists under his direction. There is but one voice as to the beauty of this edifice, both as to its external aspect and internal distribution. The statues of eminent artists by Schwanthaler, to be placed on the roof, will form one of its principal ornaments. The other buildings erected by the king are the new wing of the palace on the south side, ornamented with the frescoes already mentioned, of subjects taken from ancient German history and poetry; the new wing on the north side, consecrated to the history of the middle age in Germany, and adorned with paintings arranged in three different halls, the first of which is intended to commemorate the life and actions of Charlemagne; the second of Frederic Barbarossa; and the third of Rodolph of Hapsburg; the chapel of All Saints, built in imitation of the Byzantine architecture, and ornamented with frescoes of religious subjects by Hess; the Basilic, commenced in 1836, and to be finished in 1842, which is also to be decorated with frescoes by the same great master; the church of St. Louis; the Gothic church in the suburb of Au, the most successful attempt to revive the architecture of the middle age we are acquainted with; the Odeon or concert hall; the library and the university. The architects employed in planning and constructing these buildings were Klenze and Gärtner, whose genius has found an immense scope in the execution of such a number and variety of works.

Rauch, of Berlin, was the first German

sculptor, who, after a lapse of 250 years, attempted to revive the taste of the middle age as manifested in the works of Albert Durer. Following neither the models of antique sculpture, nor Canova, nor Thorwaldsen, he succeeded in reviving the true old German style of Fischer, and at the same time adapting it to the present state of intellectual progress and of society, thus producing works which have completely satisfied the public taste and the peculiar wants of the age. Schwanthaler has trodden in the footsteps of the great Prussian sculptor, availing himself of the fine field opened by the orders given by the King of Bavaria for the statues of the most eminent masters of painting, intended to ornament the Pinacothek, and for the bas-reliefs on the façade of the Walhalla, representing the combat of Herman against the Romans under Varus. Among the former, the models of Raphael and Michael Angelo are the most beautiful in the judgment of amateurs and of the artist himself, among the great variety of compositions he has produced. His taste in sculpture has evidently been more or less influenced by Thorwaldsen and the study of the antique, but not through a slavish imitation of this master, which would have been unworthy of a genius so original and fertile as that of Schwanthaler.

The school of Munich and the school of Cornelius are synonymous terms. Not that all the artists of this capital are his pupils. Many of them are his contemporaries, and would doubtless have risen to great eminence independent of his guidance and the influence of his example. Still it cannot be denied that his labours have mainly contributed to give a character of originality and grandeur to the school of historical painting which has recently been formed in Bavaria. The powerful genius of Cornelius assumes in his different works the antique or the romantic character, according to the respective nature of the different subjects he treats; it is inspired by poetry; the epic is his appropriate field of action. But his style is ever severe, grave, and elevated.

Schnorr is eminently German. The romantic poetry of the heroic and chivalric times has given a fixed direction to his genius. The proofs of this fact abound in his works, which transport us back to the age when poetry, war, love, and religion, were the four elements of human life. His frescoes are admirable for composition, grace, and delicate sentiment. He has occasionally painted in oil colours, but the greater part of his life as an artist has been devoted to the composition of drawings for fresco paintings. He was one of three German artists em-

ployed to adorn the villa Massimi near Rome with frescoes taken from subjects of the three great Italian poets. Those from Ariosto were drawn and painted by Schnorr, from Dante, by Cornelius, and from Tasso, by Ouerbeck. Schnorr was five years engaged in executing his part of this work, which marks the revival of fresco painting on its native soil of Italy by transalpine artists.

Henry Hess, by his natural disposition, is destined to be the painter of the Gospel history and other sacred subjects. The religious sentiment is the predominant feature in the character of his genius, which delights in the tender emotions produced by the practice of the Christian virtues. His most important compositions are the frescoes for the chapel of All Saints, representing a series of subjects taken from the Old and New Testament history. Although he was assisted in these paintings by several other artists, and though several of the series were composed and executed by others, the fame of these admirable works of art belong appropriately to him to whom the plan and the direction was exclusively confided by the king, and who executed the greater part of the cartoons, and more or less of all the paintings. They bear strong marks of analogy with the style of Giotto and the older masters preceding the age of Raphael, and even with the Greek paintings and mosaics of the Lower Empire. This manner of treating the subjects is closely connected with the Byzantine style of architecture employed in the chapel, and contributes to the harmonious effect of the whole edifice. Religion here appears in its primitive simplicity. Its solemnity is divested of all vulgar grace and alloy of human passions. We here discover the eternal type and original character of Christianity, in like manner as the peculiar genius of paganism is indelibly imprinted on the sculptures of Ægina. To have thus revived the spirit of the Gospel history, and embodied it in the language of painting, is indeed a glorious achievement in art.

The school of Munich has unquestionably been formed by an imitation of the older German and Italian masters. How far this imitation has detracted from the merit of originality claimed for it, and how far it has contributed to develop the peculiar genius of the Bavarian artists, are questions which may suggest some doubts in the minds of those who think that all imitation is injurious to genius, by turning its attention from the original forms of natural beauty to the imperfect transcripts of art. Professor Olivier, the Director of the Munich Academy,

has expressed the opinion that the arts, with some occasional exceptions, have been in a constant state of progress and improvement; that the chain of tradition, by which they have been handed down from age to age, has never been entirely broken; and that the period of greatest degeneracy is frequently marked by some redeeming traits, and is connected by some point of excellence with the most glorious epochs in the history of art.

This opinion is contested by Count Raczynski as unfounded in truth and reason.

"I do not see," says he, "for example, what connection can exist, what resemblance can be found between the paintings of Boucher and the Apollo Belvedere, except that both are works of art, which would be only equivalent to saying, that ever since art has existed, there have been artists, which is too self-evident even to require to be stated, much less to be proved. Doubtless there have been interruptions in the progress of art. The paintings of the Byzantines, as made known to us by Italy, resemble more suspense than progress in art; these paintings were not the production of imagination and taste; they had as little analogy with ancient art as the sculptures of the Mexicans had with Grecian statuary. Strictly speaking the Byzantines were artizans rather than artists. The most glorious periods have not been those which have imitated other periods not less glorious, but have been marked by a return to the original and eternal standards of nature. Cornelius would certainly have been great, without studying the antique. I even esteem him greatest where there are the fewest traces of this study, as for example in his Faust. To be a painter, one must know how to draw, and it is better to draw from good models than from bad. In this respect copying from antiques is doubtless useful to students; but to imbibe the spirit of antiquity merely in order to do what its great masters have done, is, I believe, an erroneous course. Still there are examples of genius arriving at great results in following this direction. Thorwaldsen, Cornelius, Schwanthaler may be mentioned among others. But this principle, carried too far, may rather injure than benefit a school. It cannot be too often repeated, that style is not the imitation of the antique, or of Fra-Bartholomeo: in historical painting it is the grandiose joined to calm simplicity, directed by pure sentiment, and restrained within the bounds of moderation and good taste, whatever may be in other respects the species of inspiration which has guided the composition.

"The professors, the greater part of the pupils of the academy, and in general the painters at Munich, are pre-occupied with the idea that style should be the predominant quality in works of art. I am not of the opinion that this should be the object towards which the efforts of the artist ought to be exclusively directed. If the artist be grandiose, if his conception be noble, his works will be stamped with this noble character; but style can no more be attained by effort, than grand and generous inspirations can be found where they are not the natural gift of genius. To those who have not sufficient energy to follow the lofty flight of Cornelius, style becomes affectation. I know no more than one artist, whom the pretension to style has ruined. Doubtless beauty of style is inseparable from superiority in historical painting, but it is not necessary

to be an historical painter. There are other departments of art in which equal excellence may be attained. To give this direction to talent, not adapted to excel in it, would be as unwise as to require Lafontaine to express himself in the language of Homer, by which epic poetry would gain nothing, and fable would lose much. I have too often seen at Munich, style straining after effect, and aiming at something more than ideal and sublime nature: it then falls into the theatrical and statue-like exaggerations of the school of David. The Germans have an appropriate word by which they aptly express this defect, *stylisiren*, the affectation of style. It is this affectation which I regard as the rock upon which artists of merit are in danger of making shipwreck.

"The particular direction painting has received at Munich renders the study of subjects indispensably necessary. The life of a hero, or the manners of a nation in remote times, or the conceptions of a great poet, cannot be transferred to the canvass without a profound knowledge of the subjects. But this study and this tendency of the arts have also their perils. The German is naturally prone to abstraction. It is difficult for a painter to satiate his desire to analyze and dissect. It is said to be necessary for the spectator to comprehend quickly and easily the subject of a picture. This assertion appears logically true, but volumes have been written to determine its application. For my own part I do not feel this necessity at the first sight of a work of art. With those who are gifted with a sense of beauty and a love of the arts, emotion always precedes reasoning. Thus when a spectator at the first sight of a picture begins to analyze its subject, be assured either that he is not endowed with that deep, instinctive feeling, which enables us to comprehend art, or that the work he contemplates expresses nothing. After this feeling has been gratified, it is natural to wish to ascertain whether the subject is well treated; but with a man of taste this criticism will not be considered the most important point; and still less will his attention be first directed to it. I was present when Cornelius, on his return from Italy in 1835, saw for the first time the cartoon of Kaulbach's great composition of the *Huns*. He contemplated this picture in silence, and fully recognized its beauties previous to understanding the thought which predominates in its composition. After having paid his tribute of admiration to its design and execution, he then questioned his pupil as to the subject. Yet the conception of the artist is rendered in this picture with remarkable distinctness."

Cornelius was born at Dusseldorf. His father was inspector of the Electoral Gallery, was not rich, and had a numerous family. His earlier years gave promise of talent in the art of drawing, which induced his parents to place him as a pupil in the academy.

"I was in the sixteenth year of my age," says he, "when I lost my father; my elder brother and myself were obliged to provide for a numerous family. It was at this period that my mother was counselled to bind me apprentice to a goldsmith, rather than make me a painter, on account of the great length of time required to attain eminence in the art of painting, and the multitude of competitors for public favour. My good mother rejected this advice, and I was buoyed up by the enthusiasm of youth which her confidence confirmed, and which was stimulated by the dread of being torn from my

favourite art. I thus made rapid progress, and gave early promise of greater excellence than I have ever been able to attain."

He studied the works of the old masters, not with a view to servile imitation, but in order to imbibe the spirit of their style. The paintings on the walls of the church at Weiss, near Dusseldorf, form his earliest important work. The figures are colossal, and painted *en grisaille*. The artist was then only nineteen years old. Though imperfect, these works indicate that energy which is the distinguishing mark of his talent; they also denote the study of Raphael.

At the age of twenty-six his genius took a new direction, and developed itself in a series of compositions from Faust. The excellence of these works is quite independent of any aid derived from the study of the antique. The subjects are taken from the poem of Goethe, but Cornelius has breathed into them new life. These compositions are eminently German. They were executed at Frankfort, and have been engraved by Ruschweigh. Among them, the prison-scene of Gretchen, and that where Faust and Mephistopheles are described riding on coal-black steeds by the place of execution, are inspired by the very genius of German romantic poetry. The terrific sublimity of the latter scene is admirably depicted in a fine wood engraving by Wright and Folkard, which embellishes the volume before us.

After completing these compositions in 1811, Cornelius left Frankfort for Rome. On arriving there, he found his countryman Overbeck already established, and a close friendship was soon formed between the two younger artists. They inhabited an old deserted convent, where they worked separately from morning to night, communicating the results to each other at the end of every week, and imparting in a friendly spirit their mutual criticisms. A numerous colony of German students was soon gathered in the capital of the arts, who mutually sustained and encouraged each other's efforts. Cornelius himself speaks with proud exultation of their success in aiming at a point of excellence not yet attained.

"It would be impossible," says he, "briefly to describe the circle of development which took place at Rome whilst I resided there; but I may hazard the assertion, that it comprised centuries of real progress. I speak not of myself alone, but of that cluster of individual talents and characters, animated by patriotic, pious, and generous sentiments, elicited by the enthusiastic struggle already begun against tyranny and frivolity, both in Germany and among our countrymen in Italy. Every noble nature powerfully felt the impulse of this reaction."

Cornelius employed himself at Rome on compositions from the Nibelungenlied. These cartoons have been partly engraved

by various artists, but the "Departure of Siegfried," one of the finest of the whole series, had never been engraved until it was lithographed by Zach, of Munich, for Count Raczynski's work. It forms part of the cahier of prints accompanying the present volume. The cartoons of the "Meeting of Joseph and his Brethren," and "Joseph interpreting the Dream to Pharaoh," belong also to this epoch of Cornelius' career as an artist. He afterwards executed the drawings to illustrate the *Divina Comedia* of Dante. In this work he may be said to have laid aside his own crayons, and borrowed those of Giotto and Fiesole. These compositions are marked by a purity of sentiment, softness, and calmness of manner, which contrasts with the usual energy of his style. The figures of Adam, Moses, and St. Stephen are remarkable for simplicity and calm grandeur; whilst the scene in which Dante and Beatrice present themselves at the gates of Paradise is distinguished for grace and purity. During this period the prince royal, now king of Bavaria, arrived at Rome, and made himself acquainted with the fertile and powerful genius of Cornelius, whose aid he invoked to accomplish that restoration of the arts which the prince had already projected. In order to devote his whole time and attention to this object, Cornelius resigned his place of Director of the Academy at Dusseldorf, and emigrated with a colony of pupils to Munich. Here he devoted ten years of his life, from 1820 to 1830, in the maturity of his age, and full vigour of his talent, to designing and executing the frescoes of the Glyptothek, from appropriate mythological subjects of the Homeric poems. This series was followed by the History of Painting, which adorns the *loggi* in the picture gallery of the Pinacothek. The drawings for these frescoes were executed by Cornelius. He also prepared the immense cartoons for the frescoes in the church of St. Louis. Among the subjects of these are the "Last Judgment," the "Adoration of the Magi," and the "Crucifixion," the two last of which are engraved on wood; the "Adoration," by Andrew, Best, and Leloir, and the "Crucifixion," by Lodel at Göttingen. The tendency of Cornelius in these works is at once epic and symbolic. In treating religious subjects, he not only retraces the facts as recorded in Scripture, but impresses upon them a certain mysterious character, by surrounding the principal action with a whole world of allusions, which suggest deep reflections to the pious mind. The religious sentiment, and the character of the evangelists, are expressed in a language at once new and full of energy.

The merit of Cornelius, as a reviver and continuator of art, cannot be better summed up than in the words of a letter addressed to him in 1828 by Girard, himself a great artist and critic, whose enlightened judgment is delivered with a noble simplicity, without the slightest taint of envy or jealousy.

"You have discovered the means of restoring to art her ancient life, and Germany will be indebted to you for having accomplished all that the fourteenth and fifteenth centuries had promised to bestow on her. This revival will be durable, for it is founded on truth, with which the ancients were so deeply imbued. It will be durable, because it is in accord with the manner, spirit, and literature of your age; and in this respect will this reform vary from changing modes, which in other countries have often modelled art, without impressing on it lasting characters."

Among the numerous colony of artists who emigrated with Cornelius from Dusseldorf to Munich was Kaulbach. Few men of genius have struggled through such difficulties in early life. His first essays in art were paintings for churches, for which he was very badly paid. For one of these, a Madonna with the infant Jesus, of the size of life, and painted for a church in Westphalia, he received only forty thalers. He was also commissioned to paint the walls of a chapel belonging to an asylum for the insane near Dusseldorf, for which he merely received a bare subsistence whilst employed on the work. Whilst his mind was thus depressed by the evils of poverty, the sight of these unfortunate beings left a deep and lasting impression, the recollection of which haunted him for fifteen years, until he made it the subject of that fine composition which has been engraved by Meerton, and of which a wood engraving, by Wright and Folkard, forms a part of the illustrations of the present volume.

Kaulbach afterwards executed a series of drawings illustrating the story of Schiller's *Verbrecher aus verlorner Ehre*, in the style of Hogarth, a specimen of which forms part of the separate cahier of prints. He also executed a series of paintings for the royal palace at Munich, from the works of Goethe, which represent not merely scenes and passages from this great poet, in which the original idea is taken by the artist as the germ of his conceptions, but conveyed in a style entirely new and original. The latest and most remarkable of his compositions is the *Combat of the Huns*, painted for and now in the collection of Count Raczynski, at Berlin, a fine engraving of which by Thäter accompanies this volume of his work. This subject is painted *en camïeux* in a large picture of twenty-one feet by seventeen, and of which the figures in the foreground are of

the size of life. This sublime composition is above all praise, and may be placed among the greatest works of modern artists. It was intended to be executed in colours, but the impatience of the person by whom it was ordered to possess the work, obliged the artist to relinquish his intention. We are, however, of the opinion that it would have lost more of that undefinable character of mystery and grandeur which now belongs to it, than it would have gained in any other respect by being painted in colours.

The legend which forms the subject of this picture is the most striking scene furnished by the struggle between the expiring genius of ancient Rome and one of those hordes of barbarian invaders, who, after having ravaged and subdued the provinces, attacked the capital of the empire, A. D. 452, under their great leader Attila, king of the Huns. History says that Leo, the venerable bishop of Rome, came out to meet this monarch, bearing gifts, and accompanied by the senators, beseeching him to spare the city where the Apostles had preached, and which Alaric had not violated. Attila was moved, and drew off his army from Italy laden with spoil, to pasture their herds once more beyond the Danube. But the carnage and devastations already perpetrated by the Huns left a profound impression on the popular imagination; which, as Chateaubriand remarks, "avait inventé une histoire qui semble être l'allégorie de toutes ces exterminations." In a fragment of Damascius it is related how Attila gave battle to the Romans at the gates of Rome; the armies on both sides perished in the fight, with the exception of the generals and a few of the common soldiers. As they fell, the bodies of the slain rose and continued the combat in the air with unmitigated fury during three days and nights.* It is the allegory contained in this popular legend which has been transfused into the expressive language of painting by Kaulbach, with this happy deviation from the original, that he has not separated the soldiers from their generals. The majestic figure of Attila is seen in the foreground, borne aloft on a shield by his followers, and leading on his faithful Huns to renew in the air the battle with the Romans which had been commenced on earth.

The academy of Munich and the school

* "Commissa pugna contra Scythas ante conspectum urbis Romæ, tanta utrinque facta est cædes, ut nemo pugnantium ab utraque parte servaretur, præterquam duces paucique satellites eorum: cum cecidissent pugnantes, corpore defatigati, animo adhuc erecti, pugnant tres integras noctes et dies, nihil viventibus pugnando inferiores, neque manibus neque animo."

of Munich are two distinct objects. By the school is understood that aggregation of historical painters whose talents have been developed under the influence of Cornelius, and upon whose works his powerful genius has impressed a character of grandeur common to them all, and which distinguishes them from the productions of all other German artists. The academy is also under the direction of Cornelius, but the artists formed by his example do not all recognise the supremacy of the academy. The academy derives its moral being from the school, and not the school from the academy, as grammar springs from languages, the rules of which they teach without creating these rules. In the academy resides the conservative and regulating principle of the arts, but the creative and life-giving principle, which is so powerfully at work at Munich, must be sought for elsewhere. As to the models which are proposed for the imitation of the students of painting, they are principally the works of the old masters anterior to Raphael. As already intimated, the professors act upon the principle, that the arts in their progress form a continuous chain, which cannot be interrupted without danger to their perfection. Such, in fact, has been the progress of modern art in Germany. First came the study of the antique, then followed that of the old German and the grotesque; at last each artist entered on the path which was pointed out by his own natural genius. Such has been the course pursued by Cornelius, Wach, Begass, Schnorr, and many other of their rivals. And such, according to our author, is the correct course.

"Art," says he, "ever tends to pass the bounds of taste and moderation; the greatest masters of the classic age appear in their earliest works timid and naïfs, and it is only by degrees that they attain those extreme limits in the perfection of art beyond which lies the domain of bad taste and exaggeration; but those who have attained these limits at a single bound have soon overpassed them."

"The grave and grandiose character of which the external forms of the master-pieces of antiquity furnish examples, produced certainly the best models for forming the taste and for attaining a firm and pure style of drawing. The study of the works of the Italian painters anterior to Raphael is adapted to preserve young artists from the influence of rashness, presumption, and negligence; it tends to preserve the purity of the imagination, to develop the internal emotions, and that calm serenity of soul inspired by religious sentiments which have ever exercised the most beneficial influence on the art of painting. It is, therefore, that I object to the principle of the academy only when it is pushed to its extreme consequences. When it is carried too far, I should say that it is in vain to attempt to limit the action of a talent endowed with great force, which is completely developed, which is imbued with the consciousness of its own power, and pos-

sesses adequate means of expressing with energy a great conception. It should then be left to its own free action, and if it produces great and beautiful works, the models of which are not to be found in the productions of preceding artists, its merit is not the less in my eyes for being original. Uhland has well remarked, that there is an intimate connection between the different species of poetry, but it is at the same time undeniable that there exists a creative power, which acts independently of models, and continually produces something new. The art is transmitted from generation to generation, but there is also for poetry an independent field of action in which great talents may freely move. With a similar modification the principle of Cornelius and the academy may be admitted. But as already observed, I am firmly convinced that the study of Giotto, Fiesole, Perugino, Francia, cannot but be favourable to promote the progress of the student in the early part of his career. It serves to check the tendency to those exaggerations of force and grace which form the besetting sin of youthful artists."

We are informed, but we know not on what authority the assertion rests, that Cornelius has been applied to, to paint the frescoes in our House of Commons. We trust, as England has no fresco painter, that a mean jealousy of foreign genius, before which our own stands rebuked, will not obstruct this truly generous and noble appreciation of this distinguished artist.

ART. IX.—1. *Histoire de France*, 4 vols. 8vo. 1883—1840. By M. Michelet, Member of the Institute, Professor of History in the College de France, and Chief of the Historical Section in the Archives du Royaume.

2. *Histoire de France* par Theodore Burette. Paris. 1840.

If France and England were rivals in nothing else, their respective claims to the merit of having produced eminent historical writers would suffice to supply an endless fund of international emulation. With distinct features of national character, that in many instances are either strongly contrasted or else decidedly opposed to each other, with very various bents of national disposition and national tastes, that conduct the prodigious activity of the civilized public in either country to widely opposite pursuits, there is a decided similarity of national intelligence and national instinct, which has long existed between the two people, and has now for many centuries brought forward in each country historians of the first eminence. It is needless to dwell on a literary fact so well known to historical students in

general, and to the reading public, wherever such a public exists; nor is this the place to go into an examination of the comparative merits of the grand series of French and of English historians: still, before proceeding to deliver our opinion upon the very remarkable work the title of which we have prefixed to our article, it will not be irrelevant to the subject to say a few words upon the actual historical schools of either country, on the position of historical students and their means of carrying on their literary labours, on the turn taken nowadays by historical inquirers, and also upon what we consider to be the desiderata of history.

Upon the first point the names of Lacroix, Guizot, Barante, the two Thierry's, Thiers, and numerous others occur at once to the recollection; we might have added a short time ago that the amiable and deeply read Michaud, the historian of the Crusades, introduced to the notice of the British public first in this Journal, No. XXXIII., but his life and his literary labours are closed: we purposely abstain from adding the great name of Sismondi; but we may safely say that neither last nor least among the living historians of France is M. Michelet. Lacroix, the senior of the writers whom we have just named, may in some respects be looked on as the father and founder of what we may call the modern French historical school: since he was one of the earliest writers posterior to the Revolution who reverted the long lost practice of searching original documents for himself, of seeing something else in history than a mere record, however skilfully woven together, of political facts, and of giving his reader a philosophical *aperçu* of the moral and social history of the times whereof he wrote.

Guizot, the present head of the philosophical school of French historians, has laboured more at detached portions of history than many others of his contemporaries: his profound insight into the frame-work, and inmost constitution, moral as well as political, of society is well known, and is as evident in his works as his great store of diversified reading; his opinion, never pronounced except when founded on well-considered evidence, nor until after deep reflection, carries with it a weight that few living authors have ever experienced. The unbending habits and the rigid life of the still studious philosopher and statesman contribute in no small degree to what may be called the awe of the French literary world whenever M. Guizot's authority is appealed to. Barante, now dignified with the title of Baron, and torn from the peaceful walks of literary life to the thorny paths of European diplomacy, has produced one great work by which his

name will be tested in future times, the voluminous history of the Dukes of Burgundy; this was considered a great step made in the literary world at the time of its production, as it undoubtedly was, for it testified immense labour, research both profound and conscientious, and ample ability to judge of facts when collected. It was justly considered an historical monument, and we cannot but regret that its author should have been diverted by personal ambition from a pursuit in which his name would certainly have risen high, to another course in which he will probably reap but little either of honour or reward. The same thing indeed may be said of Guizot, who, though undoubtedly the greatest of French living statesmen, would have become still more eminent and perhaps more useful, both to his contemporaries and to posterity, had he continued his historical labours on a grand and serious scale. The Thierry's, more especially the historian of the Norman Conquest of England, are two of the brightest stars of the French historical galaxy: and their works, in having laid a final seal on the system and method of what we shall term philosophical and social history, have been of incalculable service not only to the readers of their own country but to those also of all Europe. The patient zeal of the one, who unravelled the obscure chain of the general history of the Gaelic and Celtic tribes, wherever dispersed throughout the world, and the animated enthusiasm of the other, who wrote by predilection, as he tells us in his preface, the history of the woes of a conquered nation, gave a stimulus to all historical students, and held out clear and shining lights as guide marks through the darkness of by-gone days, for which the gratitude of their contemporaries can never too fully recompense them. Thiers is of quite a different stamp: those whom we have above mentioned have written for the philosopher, for the patient examining student, for the professor, quite as much as for the public. Thiers has written for the public alone. Endowed with bright abilities, with ready eloquence and with great warmth of imagination, M. Thiers has made these qualities help out his comparatively small extent of reading: he seized hold of a subject on which there was no possibility of getting an inattentive and unwilling reader, and his voluminous work flowed out of it easily and almost as a natural consequence. But, unfortunately for his reputation as an author, it was a subject upon which a calm and philosophical opinion cannot even yet be formed: the revolution was a portentous political and moral phenomenon, the causes of which philosophers are not yet able to appreciate,

because historians have not yet been able to narrate them in their entire reality; sentiments have changed and are still changing as to the fact itself, quite independently of the opinion of even so eloquent an historian. M. Thiers is another instance of a statesman formed out of an historian; and he is not a fortunate one; his eloquence and his smartness in parliamentary debate are the only qualifications for a politician that he has been able to bring into the market; while his lamentable want of political consistency, and his absolute deficiency in all the habits of a man of business, have, though he ever and anon appears uppermost in the troubled whirlpool of a French cabinet, done much to lower him in the estimation of the more serious portion of the political world.

There is a highly promising school of younger historians both existing and likely to continue to exist in France, arising not only from the long-continued encouragement prudently given by the government of that country to persons who devote themselves to this the highest branch, perhaps, of literary inquiry, but also from the national taste and demand for such productions of the mind, as well as from the impetus caused by the previously successful labours of so many great men. We may range at the head of this school, only from the date of the publication of his history, not from his own age, still less from the date of his historical researches, the distinguished professor of history in the first collegiate establishment of France, whose work we are about to notice. But we have other matters to treat of before we come to a special examination of it, and we will first briefly state our reason for not including M. de Sismondi among French historians. This gentleman, certainly the greatest historiographer of modern times, whether we consider the extraordinary extent and profundity of his researches, the universal stores of learning and knowledge of almost every kind that he has brought to bear on the subjects of his inquiries, the mild and virtuous yet strict and eminently practicable philosophy, that he always displays in appreciating the actions of mankind, or the evenly-flowing stream of his manly and polished eloquence, this illustrious writer belongs not to Italy, the country of his descent, and perhaps of his affections; not to Switzerland, the land of his choice and his abode; not to France, the nation of which he has given us so splendid a history; not to England, to which he is allied by marriage, but to all Europe, or rather to all the world.

It is one of the most curious coincidences in the literary history of mankind, that four of the great and shining lights of modern

times should have all been so intimately connected with that European paradise—the banks of the lake of Geneva. Rousseau at Geneva and Lausanne, Voltaire at Ferney, Gibbon at Lausanne, Sismondi at Geneva,—may we not add a fifth, though his visit was but transitory, Byron at Diodati?—all these have thrown a halo of literary glory around the favoured spot that will perish only with the natural beauties of that lovely scene. Three out of these great writers have thought and given the products of their minds to the world in French; our own immortal countryman has left us one of the most splendid monuments of literary labour in our own language: but the younger of his French competitors, M. de Sismondi, is hardly to be reckoned inferior to Gibbon, either for the erudition he has displayed or for the form in which he has imparted his knowledge to mankind. Twenty years devoted to the history of the Italian Republics, twenty, or rather thirty, to the history of France,—sixteen volumes of the former work, twenty-four of the latter, besides a history on Gibbon's own subject, which, though written on a perfectly independent basis and brief, is not less philosophical in the views which it develops, together with the literary history of Southern Europe, and numerous other works; all these form a stupendous monument of intellectual labour which no other living author of Western Europe can pretend to, and which, like Laplace's great labours in celestial mechanics, is far too extensive, far too important, far too transcendental, for the great mass of superficial and unlearned readers. To appreciate M. de Sismondi's labours as they deserve to be, it is necessary to be extensively read in ancient and modern history, just in the same way as it has required the erudite acquisitions of a master-mind to bring forth a new edition of Gibbon worthy of the great historian, and to rescue his fame, if indeed it needed any rescue, from the bigoted ignorance of interested declaimers. Far from approving of the view which Gibbon takes of facts or of his criticisms on history, we yet give him due credit for laborious research, and a desire to state events as they happened. We hasten at once to declare that the history of France by M. de Sismondi, is the chief, the standard work on that subject. Other histories may, and no doubt will, develop particular parts of that matter more fully:—none more philosophically, none more eloquently, none more virtuously. It has remained for one person to take the poetical view of the question, and to treat the history of his country partly in the imaginative, partly in the moral, and altogether in the

social point of view,—this writer is M. Michelet.

Only a few lines are necessary for the carrying out of our comparison of English living historians with those of France. Hallam is no doubt our chief luminary in this respect; the most widely-read and the most accomplished, if not the most eloquent, of our historical writers: Lingard and Sharon Turner, who may be fairly placed next in the scale of competition, not only for voluminous extent of production, but also for great erudition and honest research: Milman and Thirlwall, whose German references are invaluable, as vigorous, original, and independent writers, labouring for truth and for posterity; the eloquent and masterly pen of Lord Mahon, conferring equal honour on himself and on the noble order of which he is a bright ornament: the learned labours of Sir F. Palgrave; the poetic antiquarianism of Moore; and numerous other instances; all these fairly place the living historical world of the British islands on a perfect level with that of France; and, were it not for fear of being accused of undue national prejudice, we should say that in many of the most valuable qualities of historical writing, they give it even a superiority. Our two extinct historians, Mackintosh and O'Driscoll, the former greatly overrated, the latter not sufficiently known, we should compare to Michaud and Daru in France, who, like them, are slumbering in the grave. Any writer to compare with Sismondi we have not: we have had our Gibbon: we must wait for another century.

The position of historical students, and their means for carrying on historical inquiries, we take to be much better in France than they are in England. The practical levelling of ranks in the former country, a circumstance for which we by no means desire to express any apology or any unqualified approbation, though like all human modifications of society it has many accompanying evils, yet has certainly had the effect of making the profession of letters one of the most honourable in the community. In England, a "mere author" is regarded often as a literary adventurer, sometimes as an intellectual brigand, nearly always as a quill-driving operative. The favourites of the public, when they come to be favourites, are certainly splendidly rewarded, and the ten or twelve literary lions of the day are patronized and received in every society; but as a class literary men are not encouraged, or at least not encouraged directly. They are rewarded as legists, as ecclesiastics, or as physicians, but not as authors. In France, on the other hand, the

mere title of "Homme de Lettres," is as indicative of a distinct and honourable profession as those of "Militaire," "Jurisconsulte," or "Médecin," and, like them, forms an unobjectionable passport with all the upper classes.

In England facilities for research to a certain extent are no doubt given both in public and private libraries, and in government collections of records; generous patronage is certainly more exercised by individuals in England than in France; but whatever is done, is done in the way of patronage, and not conceded as a matter of right, or one of national interest. In England, unless an author is a member of one of the universities, or can get introduced to the British Museum, there is no library, no really great library to which he can readily get access; and for an unknown, unrecommended individual to apply at the Tower or the Rolls, to search for records, would be an act of madness never attempted more than once by the same person. Not so in France:—all the public libraries of the country are really public, and open to the use of the most obscure applicants; no introduction, no patronage is required; the most valuable works, the most precious engravings, are confided to the local inspection of the first comer, and, to the great honour of the country, are not thereby injured: nothing is more easy than an introduction to the record office—the *Archives du Royaume*,—the administrators of which take a pleasure in helping the public to information. Hence it is that original literary labour is susceptible of being carried on with much greater effect, and by a much greater number of persons in France than it is in our country, and added to the system of gratuitous lectures, as well as to what it is connected with, both as cause and effect, a general friendly feeling in the republic of letters, it has already produced excellent results in raising the literary character of the nation, and will every day do more and more good in the special promotion of historical and documental knowledge. For the publication of memoirs, always an expensive and not seldom a losing undertaking, for the reprinting of scarce works, the editing of precious MSS., &c. we think that France, with her comparatively small pecuniary means, is doing much more than England, and is gaining for herself a more honourable name in the literary history of the century. As for the governments of the two countries, our own, we know, patronizes nothing, or next to nothing, whether in art or in literature. The French government, on the other hand, makes the encouragement and

the regulation of literature and science an important branch of state administration, while its enlightened love for the fine arts has long been known. We hold that on these accounts the position of the young historian and the means afforded him for carrying on his labours, are more advantageous among our Gallic neighbours than among ourselves.

The turn taken by living historical inquirers in France—what is doing in England it is not our business to advert to—is decidedly the examination and the illustration of the social and moral condition of the nation at various epochs of its existence. To ascertain how the thing called a nation has actually come to exist, it is necessary to know not only its action upon other nations, and their reaction upon itself, but also its own internal workings, its own moral, intellectual, and social growth. To learn this correctly, however, we have to go into the minutest details of ancient existence; all the labour and skill of the antiquary and the archivist have to be called into requisition, and it requires a long series of years of joint literary labour, as well as a vast number of memoirs and papers of all kinds to be published before the historian can have sufficient materials to work upon. Till within fifty or sixty years the social conditions of Greece, Italy, Egypt, and other nations of antiquity were alone considered worthy of investigation; what are now termed the *middle* were then complacently styled the *dark* ages; their literature was unknown, their arts and sciences contemned, and public attention was altogether averted from them. The case is far changed at the present day; we are profiting by the silent and apparently disjointed labours of our national antiquarians, and the result has been that new mines of literary and moral, to say nothing of scientific and technic, wealth are opening by historical pioneers every day. We are now at length learning how to judge fairly of our ancestors, and how to appreciate our own condition of national existence.

This leads us to mention that the desiderata of history are to be inferred from a careful comparison, not only of the qualities of what we may call the political historians, but also of those of the delineators of the social and moral peculiarities of any given race of men. Gibbon certainly, more than any other individual who preceded him in our own series of historians, has united all these qualities; and Sismondi, among those who have elevated the French language by their labours. Hallam, of our living authors, is the one who has been most successful in a similar way; and Michelet among

those of the present French school. We cannot better illustrate the desiderata of a good history,—a moral and social history at least, than by at once proceeding to notice our author and his work.

M. Michelet, whose historical labours both on ancient and modern topics have long rendered him a great favourite with the French public, and whose highly interesting memoirs of Luther, compiled from his own letters, have been already favourably introduced to the notice of British readers by a contemporary, is placed in one of the most enviable situations that an historian can hold, as chief of the Historical Section in the Archives du Royaume. All the riches of this immense establishment are in his own keeping; and this circumstance, added to his honourable position of principal Professor of History for France puts him at once at the head of the historical portion of his own countrymen. To the accumulated stores of a life of continual research he adds the precious acquirements of a most accomplished modern linguist, and a well-read scholar in the tongues of classical antiquity; he possesses unwearied powers of application, and is one of the most conscientious searchers of original documents that is any where to be met with.

The first two volumes of the History of France were published in 1833, and this immediately created a great sensation in that country; the third came from the press in 1837, together with his work, in imitation of Grimm's, on the *Origine du Droit Français*; the fourth has been published this year, and a fifth is to follow it in a few months. He has condensed into this work, if we may so venture to term it, an immense collection of observations and essays on the moral and social condition of the French nation, from the earliest periods up to 1422, when the English had become, for a time at least, settled in France; and in so doing he has developed at great length all that relates to the religion, the national and social manners, the local peculiarities, the amusements and the occupations of the people. We say so with the respect due from those who have sat at the feet of so eminent a professor, that for a general connected account of the total history of France we should not consult his book,—we should always revert to Sismondi; but for the illustration of any peculiar point of social history we should dive into his volumes, and we should bring up no small treasure. The highly poetical and religious turn of mind of this author leads him to place every thing in new and original points of view; his descriptions are accurate, full of details, and eminently graphic;

but still they are poetical, and bear plain marks of a very imaginative mind. This bent of our author, added to the peculiar transformation of style and composition which the French language has undergone within the last twenty years, renders the translation of his work almost impossible, at least into English. Like all French writers of the present day, M. Michelet constructs his sentences in brief isolated phrases, often of one member only, seldom of more than three;—in fact, his style may be said to be composed of a series of poetical ejaculations; and there is no way whatever of converting it into English, that could for an instant be tolerated by an English ear, without entirely disregarding the author's own division of his sentences. In the passages we are about to quote, we confess that to get at anything like the meaning of the original—for the French language is becoming more and more untranslatable every day—we have been obliged to construe with great amplitude, and to weave our sentences together something upon the English plan. In mentioning the social condition of the Celtic tribes in France, M. Michelet says :

"Whatever may have been the results of such a circumstance, it is a subject of honour and congratulation to our Celts to have laid the foundations of the law of equality in the west of Europe. The consciousness of personal right, the vigorous assertion of personal interests, which we have remarked in their religious philosophy, as in the case of Pelagius, appear more clearly in their political systems; and furnish us, in part at least, with the secret of the destiny of the Celtic races. While the families of the Germanic nations were rendering themselves immoveable, while their possessions were becoming perpetual, and aggregations of land were forming in consequence of their hereditary system, the families of the Celtic nations were, on the contrary, more and more dividing, sub-dividing, and enfeebling themselves. This weakness resulted chiefly from the equality of their partitions; and the destruction of their race was ultimately caused by their law of premature equity. They have a right to glory in it, and they are at least entitled to the pity and the respect of those for whose future advantage they gave at so early a period the indications of such an idea. This tendency to an equalization, to a general levelling, which in matters of law and policy isolates men from one another, needs to be counterbalanced by some lively sympathy in order to draw them together again, and in order that man, freed from his fellow-man by the equity of the law, may be again united to him by a voluntary bond. This is what in the end has been witnessed in France, and it is this circumstance that explains the greatness of the country: it is by this that we have become a nation, while the unmixed Celts have never been anything but clans. The petty association of the clan formed by the rude bond of relationship, real or fictitious, has ever been found incapable of admitting anything from without, and of attaching itself to any thing foreign. Thus the 10,000 men of the clan of the Campbells are all cousins of the chieftain; they all bear the same name; they have no farther am-

bition, and they hardly acknowledged themselves to be Scotch. A small, dry, nucleus-like clan has ever been found unfit for aggregating anything to itself; flints are not good materials for building, mortar will hardly stick to them; whereas the Roman brick has ever taken it so well, that even at the present day mortar and brick may be seen in ancient buildings forming but one solid block, and a mass almost indestructible." "The Celtic people have no great cause as nations to be gay; everything has gone against them; Brittany and Scotland have ever attached themselves to the weakest side and the last cause; the Chouans of the former supported the Bourbons, the Highlanders of the latter the Stuarts; but they can no longer make kings,—they have lost the power ever since the mysterious stone that was brought from Ireland to Scotland has been carried away to Westminster. Of all the Celtic population, however, the Bretons have, perhaps, the least need of commiseration; for Brittany has long been a participator in a system of gentle equality, and France is a country at once humane and generous. The Cymry of Wales, under the sway of the Tudors, were admitted to share in the rights of England; but it was only by torrents of blood, and the massacre of the bards, that England introduced this happy fraternization. After all, perhaps, it is more apparent than real. And what are we to say of Cornwall, so long the Peru of England, and valued by her only for her mines? That district has at length lost even her original language." "A strange destiny, that of the Celtic world! Of its two divisions, one, though the least unfortunate of the two, perishes, wastes away, or loses its language, its costume, and its distinctive character,—I mean the Highlanders of Scotland; with the populations of Wales, Cornwall, and Brittany. These, forming the serious and the moral element of the race, seem to be dying away, and threaten soon to become extinct. The other part, full of life, multiplies and increases in spite of everything:—I speak of Ireland.

"Ireland! the eldest of the Celtic race, so far away from France her sister, who is unable to defend her except across the waves! The Isle of Saints! the Emerald of the Seas! all-fertile Ireland, whose men shoot up like blades of grass, and frighten England with the ominous sound that daily rings in her ears—'There is a million more of them!' the land of poets, of men of daring thoughts—of John Scotus Erigena, of Berkeley, of Toland, of Moore, and of O'Connell! People of the brilliant word and the swift sword! people that in this, the decrepitude of the world, still retain the gift of song! Let England smile, if she will, when in some obscure and wretched corner of her crowded cities the Irish widow is heard raising the coronach over her husband's corpse. Weep on, poor Ireland! France, weep thou too! weep that thou seest in thy capital, over the door of the House of Learning which is still open to the children of Ireland, the harp that in vain demands thine aid! Let us weep that we cannot give back to her the blood that she has spilt for us! But is it to be in vain that within less than two centuries four hundred thousand Irishmen have combated in our armies? And are we to witness the sufferings of Ireland without uttering a word? It is thus, however, that we neglected and forgot the Scotch, our ancient allies! Yet a little, and the Scottish Highlanders will have disappeared from the world; the Highlands are becoming every day more and more thinly peopled; the boundless estates which ruined Italy are devouring Scotland. The Highlanders will soon cease to exist except in history, or in the

pages of Walter Scott! Even as it is, people at Edinburgh run to their doors when they see the tartan and the claymore go by! They are all going away—they are all emigrating; and the bagpipe plays one only, and a melancholy air, amid the mountains:—

‘Cha till, cha till, cha till, sin tuile!’

‘We’ll come back, we’ll come back, we’ll come back—Oh! never!’”

Vol. i. p. 150—160.

This may not all be true. The names of Moore and O’Connell, the breather of treason and lies, and the composer of the same admixtures, certainly ought to receive due qualification. Erigena was a Scot, as the well-known *bon mot* between him and Charles the Bald proves. The king asked him, as they sat opposite to each other, “Master, what is the difference between a Scot and a Sot?” “Only the *table*!” replied Erigena. Erigena died a victim to monkish barbarism.—But still the passage is highly poetical, and it presents some obvious facts in a perfectly new light: it is deeply impressed with the melancholy feeling that the perusing of the records of unfortunate races cannot but cause, and it tends strongly to show the compassionate sensibility of the mind of the writer.

In treating of the religion of the middle ages, M. Michelet, who as an antiquarian and a poet (there may be many poets who never wrote a verse) is a catholic, and as a philosopher and a Christian is one of the most mild and tolerant of men in all his opinions, religious and political, devotes numerous pages full of imaginative beauty to the consideration of Christian architecture: the following is a specimen:—

“That Gothic art has had something analogous to itself at Babylon, in Persia, or in Spain, is not to be doubted; but this affects the question only in a slight degree; that art belongs more especially to the place where it took deepest root, and where it made the nearest approaches to its own ideal perfection. Our Norman cathedrals are peculiarly numerous, beautiful, and various: their daughters of England are wonderfully rich, delicately and skilfully ornamented. But the mystic genius of the style seems to be more strongly marked in the churches of Germany, a land that was well prepared, a soil made expressly to bring forth the flowers of Christ: no where else have man and nature, the brother and the sister, played together under the eye of their Father with more pure or more infantine affection. The soul of the Germans betook itself to the flowers, the trees, the fair hills of the Lord, and its simplicity built out of them miracles of art. It was there that the middle ages produced golden souls, which passed away without being known, souls of purity, of child-like innocence and yet of profound thought, which scarcely suspected what the duration of time meant, and which can hardly be said to have come forth from the bosom of eternity, but left the world to flow unheeded by and saw in its troubled waves naught but the reflected azure of the sky above. How were they named? who can tell us? We

know nothing more than that they formed part of the mysterious and vast association that was everywhere spread about. They had their lodges at Cologne and Strasburg; their mark, as old as Germany itself, was the mallet of Thor; and with this, which was sanctified in their Christian hands, they continued throughout the world the great work of the new temple, itself the renewal of the temple of Solomon. To know with what care they laboured, obscure as they were and lost amid the association, or with what abnegation of themselves they persevered, the most remote and inaccessible parts of cathedrals ought to be visited. Climb these aerial deserts, mount to the highest points of the spires where the tiler cannot trust himself without trembling, and you will often find, lonely and seen by the eye of God alone, some chef-d’œuvre of art and of sculpture upon which the pious workman has spent his life. Not a name, not a sign, not a letter is there upon it! he would have thought himself robbing God of his glory had he put any: he laboured for God alone, and for ‘the remedy of his soul!’”—vol. ii. pp. 679—681.

“How are we to reckon up our beautiful churches of the thirteenth century? I could have wished to have said something about Notre Dame de Paris; but there is one* who has marked that monument with such a lion’s claw that none else may now trust himself to touch it; henceforth it is a thing for himself alone; it is his fief; it is the patrimony of Quasimodo. If I were to treat of this church I should consider it as a book of history, as the great register of the destinies of the monarchy. Its western portal, formerly surmounted by the statues of all the kings of France,† was the work of Philip Augustus; the southern portal was that of St. Louis; the northern of Philip the Fair, built out of the spoils of the Templars. The Porte Rouge is the monument of Jean-sans-Peur, Duke of Burgundy, the assassin of the Duke of Orleans. The great and massive building, thick wrought with fleure-de-lys, belongs to history no less than to religion. Notre Dame de Paris is the church of the monarchy itself, Notre Dame de Rheims of the crowning of the heads of that monarchy. St. Denis is the church of tombs; not a sombre and melancholy necropolis, like those of pagan antiquity, but glorious and triumphant, radiant with faith and hope, ample and unshaded like the soul of its builder, St. Louis; simple without, beautiful within, lofty and light, as though it would lie gently on the dead! The steps that lead from the nave to the choir seem as though they waited for the generations that were to mount and to descend with the last remains of the kings. At the period of which we are treating, the thirteenth century, Gothic architecture had attained its plenitude, and was in all the severe beauty of virginity, that short, that adorable moment, in which nothing here below can remain. To the period of pure beauty succeeds that second period of youth when the knowledge of good and evil pierces through the melancholy smile, and penetrating glances escape from languid eyelids: at such a period no festivities are too many to soothe the troubles of the heart, and at that time it is that ornament comes to the aid of beauty. Such was the Gothic church in the second age; it was then that she became coquettish and decked herself out; it was then that she adopted the rich window capped with the triangular canopy: elabo-

* Victor Hugo.

† We beg leave respectfully to differ from M. Michelet on this point: the statues were those of the kings of Judah, and their position in the edifice had reference to the genealogy of the Saviour.

rate tabernacle work then became appended to her doors and towers; and transparent lace work of stone spun from fairy spindles then decorated her! At length the human and natural part of Christianity developed itself more and more, and ultimately invaded the Church; Gothic vegetation, tired of continually mounting upwards, extended itself upon earth and produced its fruits: but what fruits? Images of man, painted and sculptured representations of Christianity, of the saints, of the apostles. Painting and sculpture, the material arts that reproduce finite subjects, came by degrees to stifle architecture, which as the abstract art, infinite in extent but silent in its nature, was unable to contend with its more lively, and more communicative sisters. The human face diversified and peopled the holy nudity of the walls; under pretext of piety man placed his own image everywhere; it entered under the form of Christ, of the apostles, of the prophets; at a later period it entered in man's own name humbly couched upon the tomb, for who could refuse a place to the dead? The dead contented themselves at first with a simple stone on which the effigy of the defunct was engraved; by degrees the grave-stone swelled into a tomb, and the effigy became a statue; the tomb next became a mausoleum, a canopy of stone that filled the church; and at length a chapel, or even the church itself. God, straitened within his own house, scarcely retained in it even a chapel; man had enthroned himself in the Christian church, and there was nothing remaining for it but to become a pagan church again, and to re-assume the form of the Hellenic temple."—vol. ii. p. 683—689.

The second volume opens with a long and most important chapter upon the influence of locality on national character, which is illustrated by a consideration of the peculiarities of the inhabitants of each of the old provinces of France, as connected with and resulting from the position and the physical qualities of the districts themselves. This chapter is well worthy of the most careful perusal, and should be taken as a model for similar researches which might be advantageously made in other nations. We select the following passages.

"Our entrance into the great valley of the South of France may be made by the Rouergue, a province of a rough and decided character. In itself, all shaded by its sombre chestnut-trees, it is but a mass of coal, of iron, of copper, and of lead. In many spots, the coal is on fire, and has been burning for ages, though not from volcanic agency. This district, little favoured by heat or cold on account of the various directions by which it is exposed and the various climates that are to be found in it, is broken up in precipices, deeply scarred by two torrents, the Tarn and the Aveyron, and has but little to envy in the rudeness of the Cevennes. It will be better, however, to enter by Cahors. There all the land is clothed with vineyards; the mulberry trees commence at Montauban; before us opens an immense landscape of thirty or forty leagues in extent, an agricultural ocean, a living and confused mass lost in the indistinctness of distance; while beyond appear the fantastic forms of the Pyrenees with their silvery summits. The ox fastened to the yoke by his horns is labouring at the plough in the fertile valley, and the vine tendrils are climbing round the branches of the elm; if we turn towards the mountains we shall find the goat clinging to the

arid hill side, and the mule winding with its load of oil up the narrow paths of the less elevated districts. At noon comes on a storm, and the land is turned into a lake; within an hour the sun has drunk up all the moisture, as it were at a single draught. In the evening we arrive at some large and sombre town, at Toulouse, where from the sonorous accent of its name we might think ourselves in Italy: but to be undeceived we have only to look at the houses in wood and birch; the rough speech and the bold lively gait of the people will soon remind us that we are still in France.

"The middle and upper classes, that is to say, are French; the lower are perfectly different, Spaniards perhaps in their origin, or Moors. Here, then, is the ancient Toulouse! the city that was so great under its counts, and that under our kings obtained by its parliament the power of royalty, the sovereignty of the south. Those violent legists that came forth from it, and gave to Boniface VIII. the blow intended for him by Philip the Fair, took many an opportunity of excusing themselves for it at the expense of the heretics; of whom, within less than half a century, they condemned four hundred to the flames. At a subsequent period they lent themselves to the vengeance of Richelieu, sat in judgment on Montmorency, and had him decapitated in the Hall, which still bears the stain of his blood. They used to boast, at Toulouse, of having a capital like that of Rome, and a cavern of the dead like that of Naples; in the capital of Toulouse the archives of the city were preserved in an iron chest like those of the Flamens of Rome: while the Gascon senate inscribed on the walls of their council chamber, '*Videant Consules ne quid respublica detrimenti capiat.*'

"Toulouse is the central point of the great basin of the south of France: it is there, or thereabouts, that the waters of the Pyrenees and the Cevennes, the Tarn and the Garonne, meet to flow together to the ocean. The Garonne receives nearly all the streams; the sinuous and trembling rivers of the Limousin and Auvergne flow into it from the north by Perigueux and Bergerac; from the east and from the Cevennes come the Lot, the Viazur, the Aveyron, and the Tarn, by Rodez and Alby. The north furnishes rivers, the south torrents; thus, from the Pyrenees descends the mud-charged Arriège, while in the north-west the Garonne, increased by the Gers and the Baize, describes a curve of elegant form, which is repeated on a smaller scale in the south by the Adour. Toulouse forms the separation between Languedoc and Guyenne; two countries far different from each other, though under the same latitude. The Garonne flows by the ancient Toulouse, the representation of Roman and Gothic Languedoc; and thence, still swelling, expands itself like a sea in sight of the ocean and of Bordeaux. This latter city, modern by its very essence, long the capital of the English part of France, and for a still longer period English in heart, turns itself, on account of its commercial interests, towards England, towards the ocean, towards America. The Garonne, or as it should now be termed, the Gironde, is twice as wide at Bordeaux, as the Thames at London.

"All beautiful and luxuriant as is the valley of the Garonne, it is not for us to remain in it; the far-off summits of the Pyrenees form too powerful an attraction. The way to get to them, however, is a serious affair; for whether you go by Nerac, the poor and scanty domain of the Albrets, or whether you take your road along the coast, you see nothing before you but an ocean of *landes*, a few cork trees, immense *pinadas*, and sombre solitary roads, with no other companions than the flocks of

black sheep taking their eternal journey from the Pyrenees to the Landes, and going down from the mountains to the plains, from southern to northern regions, to seek for warmth, and to be tended by a Landais shepherd. The errant life of the shepherds is one of the picturesque characteristics of the south; you meet them coming up from the plains of Languedoc to the Cevennes or the Pyrenees, and from the Crau of Provence to the mountains of Gap and Barcelonnette; they are nomads; they carry all they possess along with them; they are the companions of the stars in their ever-enduring solitude; half astronomers, half sorcerers; and they perpetuate, in the midst of this our western world, the life of the Asiatics, the life of Lot and of Abraham.

"The formidable barrier of Spain at length appears before us in all its grandeur. It is not, like the Alps, a complicated system of peaks and valleys: it is nothing more nor less than an immense wall lowering itself at each end. At every other point the passage is totally inaccessible to vehicles, and shut even for mules and men during six or eight months of the year. Two people totally distinct from any others, and who, in reality, are neither Spaniards nor French, the Basques, that is to say, in the west, the Catalans and Rousillonais on the east, are the porters of these two worlds. It is they who open and shut, irritable and capricious door-keepers, tired of the eternal passing by of nations, they open to Abderrahman and they shut against Roland; there is full many a tomb between Roncevaux and the Seu d'Urgel. To describe and explain the construction of the Pyrenees is not the task of the historian; it is for the science of a Cuvier or an Elie de Beaumont to relate their antehistoric history. . . . We will not ascend the Vignemale, nor the Mount Perdu, but only the Por de Pailles, where the waters of the chain of mountains are divided between the two seas, or rather between Bagnères and Baréges, between the beautiful and the sublime. There your eye may seize on the fantastic beauty of the Pyrenees, their strange, their incompatible sites, which seem to be drawn together by the power of some inexplicable piece of fairy sleight; there you may witness the magical effect of the atmosphere that now brings objects close to you and now removes them far off; there you may look down upon the foaming *Gaves*, and on the meadows of emerald green. Let us push on, let us wind along the Gave de Pace, through the stern and wild pass where blocks of stone, thousands of feet in cubic thickness, are piled in rude confusion: let us get amongst the rocky peaks and the everlasting snows, and the windings of the Gave, shut up and buffeted about from mountain to mountain; at last we enter the stupendous Cirque de Gavarnie, with its towers hid among the clouds. There, at the bottom, are the twelve sources of the Gave murmuring beneath bridges of snow, and falling down a depth of 1300 feet, the highest cataract of the old world. It is here that France ends: the Port de Gavarnie, which you see up above you, that stormy pass, where, as the proverb runs, the son stops not for the father, is the gate of Spain. An endless store of poetical and historical tradition hovers over these limits of the two worlds. . . . That immense embrasure, three hundred feet in depth, amid the mountains, Roland cut it open with two strokes of his *Durindana*; a symbol of the eternal combat between France and Spain, between Europe and Africa, in which, though Roland perished, France has remained victorious.

If we compare together the two slopes of the Pyrenees we shall see that ours, on the French side, has greatly the advantage. The Spanish side, exposed to the southern sun, is abrupt, arid,

and wild; the French slopes gradually, is better shaded, is covered with luxuriant pastures, and supplies the other with great part of the cattle it requires: Barcelona in fact derives all its supply of cattle from France; and the country of vines and pastures is forced to purchase both our herds and our vines from us. On one side are a fine sky, a mild climate, and poverty; on the other, fog and rain, but with them intelligence, riches, and liberty. Pass over the frontier and compare our splendid roads with their wretched horse paths,—or go and contemplate that group of foreigners at Caunterets covering their rags with the dignity of their cloaks, sombre in their aspect and disdaining to compare themselves with the French. But fear not, Spain, great and heroic nation! we have no intention of insulting you in your misfortunes.

"The genius of our good and sturdy Flanders is positive and substantial, '*solidis fundatum ossibus intus*.' On its plains, fat, fertile, and full of rich exuberant vegetation, thickly traversed by canals, well cultivated and well manured,—on such plains as these, plants, animals, and men rival each other in wantonness of their growth, and shoot forth luxuriantly. The ox and the horse swell out there like elephants: the women are as large as the men, and often larger. The race after all has something soft in it, notwithstanding its corporeal grossness; strong rather than robust, and of immense muscular force. Witness the giants at our country fairs, how often have they been brought from our department of the Nord! The prolific strength of the Bogs of Ireland is to be discerned in the Belgians of Flanders and the Low Countries. In former days, amid the thick mud of those rich plains, in those vast and sombre commercial communities of Ypres, Ghent, and Bruges, men used to hum like insects after a storm: and it was not safe to tread upon one of those ant-hills: for there would come out of them at the very instant men by fifteens, twenties, and thirties of thousands, with lances lowered, well clothed, well armed, well fed, strong and resolute; and feudal cavalry played but a very indifferent game against masses such as those.

"The manners and customs of Flanders are not very edifying; on the contrary, they are sensual and gross. The more we advance towards the north in that fat country, beneath its mild and humid atmosphere, the more does it become softened, the more does the sensual system predominate, the more powerful does the sway of nature become. The science of history and the art of relation no longer appear to satisfy the want of witnessing the reality, and the desire of gratifying the senses. The arts of design are called in to their aid: sculpture is to be met with even on the French side of the frontier, and its types are the works of Jean de Boulogne, the pupil of Michael Angelo. Architecture also springs up; not the sober and severe architecture of Normandy, . . . but a style rich and ample in its forms; the pointed arch becomes softened into gentle curves, and voluptuous encirclings; in some instances the curve is weakened, and dwindles in; in others it swells, and bellies outward. The beautiful steeple of Antwerp, round and undulating in all its ornaments, rises gently stage by stage, like a gigantic piece of basket-work woven out of the reeds of the Scheldt. The Flemish churches, carefully kept, well washed, and gaily dressed out, like Flemish houses, dazzle the sight with their extraordinary cleanliness, their rich decorations, the splendour of their brazen ornaments, and the abundance of their white and black marbles. They are much cleaner than the Italian churches, and decked out with far greater coquetry. Flanders is Lombardy in prose, but

without its vines and without its sun. Nor are these the only things that are wanting to the former, as far as its public monuments are concerned; there is something else, and we soon become aware of it, when we see the innumerable figures in wood that meet the eye in the cathedrals, where they are ranged along the pavement; they are an economical kind of sculpture, and but ill replace the marble populations of the cities of Italy. High above the Flemish churches, on the tops of the towers, the uniform and skilfully combined chimes of bells, the honour and joy of every Flemish community, ring out harmoniously. The selfsame tune, played from hour to hour, and from age to age, has sufficed for the musical wants of unnumbered generations of artisans, who have been born and died under and upon their shopboards. Music, however, and architecture, are too abstract to suffice of themselves alone for the genius of Flanders. Sound and form are not enough; colours are wanted: warm and bright colours, vivid representations of flesh, and of the animal faculties. The Flemings require pictures of good boisterous fêtes, where red-faced men and fair-cheeked women drink, smoke, and dance with clumsy mirth; they require representations of horrible punishments; martyrdoms at once indecent and terrible; virgins enormous in size, fresh coloured, fat, and of a beauty to scandalize the worshipper. It is only on the other side of the Scheldt, in the midst of the dreary marshes, the deep waters, and the high dykes of Holland, that sombre and serious painting begins: Rembrandt and Gerard Dow painted where Erasmus and Hugo Grotius wrote. But in Flanders, in the rich and sensual Antwerp, the rapid brush of Rubens executed the very bacchanalia of painting. The mysteries that he represented in his pictures are all travestied; and while they tempt one to worship them for their extraordinary excellence, they inspire one with horror by the fire and the fury of his genius. That impetuous painter, descended of Slavic blood, brought up amidst all the exuberance of the Belgians, and though born at Cologne, a thorough enemy of German idealism, has embodied in his pictures an unbridled apotheosis of nature."—vol. ii. p. 103—108.

After having gone round all the provinces of France, M. Michelet returns to the centre, and proceeds:—

"The name of Paris is equivalent to that of the monarchy; but to explain how the grand and entire symbol of the whole country should have been formed in a single city would require the full history of the nation, in which the description of Paris would form the last chapter. The genius of Paris is the most complicated, and at the same time the most elevated, form of the genius of France; and it might have been expected that what was to be the result of the annihilation of all local spirit, of all provinciality, would in itself be altogether negative; on the contrary, however, out of all these negations of material, local, and individual ideas, there has sprung a living generality, a thing of a positive nature, an actuating force,—such in fact as we had proof of in 1830.

"It is a grand and extraordinary spectacle to cast one's eyes from the centre to the extremities, and to embrace in one view the vast and powerfully organized system, the various parts of which are so skilfully brought together, contrasted, and associated, the weak to the strong, the positive to the negative; to see the eloquent vinous Burgundy placed between the ironic naïveté of Champagne, and the criticizing, quarrelsome, warlike spirit of Franch-Comté and

Lorraine; to perceive the fanaticism of Languedoc interposed between the levity of Provence and the indifference of Gascony; or to witness the covetous conquering genius of Normandy kept in between the resisting force of Britany and the massive strength of Flanders. France may be said to undulate in two long organic systems, similar to the double economy of the human body,—the gastric and the cerebro-spinal. On the one hand are the provinces of Normandy, Britany, Poitou, Auvergne, and Guyenne; on the other, Languedoc, Provence, Burgundy, and Champagne; Picardy and Flanders are where the two systems become connected: and Paris is the sensorium of the whole. Its strength and beauty consist in the reciprocity of the powers of succour, in the combined solidity of its parts, in the distribution of their functions, and in the division of their social labours. The resisting and warlike forces, the faculty of action, are at its extremities; intelligence is at its centre,—the centre which understands not only its own functions but those also of all the other parts. The frontier provinces, which are those that co-operate the most directly in the defence of the country, preserve their military traditions, keep up their spirit of barbaric heroism, and with their energetic populations recruit those of the centre, enervated and worn out by the rapid friction of social rotation. The centre, sheltered from the shock of war, invents and innovates in arts, in science, and in policy; alters the form of whatever it receives; imbibes the juice of life in a crude state, and adapts it to its own conformations. In it each province sees itself reflected; in it each district admires itself under a new and better form:

'Miranturque novas frondes et non sua poma.'

"This beautiful system of centralization, by which France is what it is, causes at first sight a painful sensation. The spirit of national life is at the centre, and at the extremities: all the intermediate parts are weak and colourless. Between the rich district of Paris and the wealthy plains of Flanders the road lies through Picardy, an old and melancholy province, similar in its fate to all the provinces that have been centralized without becoming centres themselves. It would seem as though the force of attraction had weakened and thinned them; they look solely to the centre, and are great only in its greatness: still they are greater by this very bias of central interest than eccentric provinces can ever become by dint of their individual originality. Picardy, though centralized, has produced Condorcet, Foy, Beranger, and other great men of modern times: have the rich and luxuriant Flanders and Alsace any names, at least in our times, to compare to these? In France, the chief glory for a man is to be a true Frenchman; and in this respect, though the extremities of the country may be opulent, powerful, and full of military enthusiasm, it cannot be denied that they have often interests of their own opposed to those of the nation, and that they are not so much French as other parts of the country. The Convention had to conquer the federalism of the provinces before conquering the confederation of Europe; and on the same principal Carlism is strong at Lille and Marseilles; while Bordeaux, though a French city no doubt, is quite as much a Colonial, an American, or an English one: the reason being, that it feels the necessity of keeping up its sugar trade, and of finding markets for its wines.

"It is one of the peculiar causes of the strength of France, that upon all her frontiers she possesses provinces which unite a certain portion of foreign feeling with what they hold of the common national spirit. Thus to Germany she opposes the German part of France, to Spain the Spanish, and to

Italy the Italian. Between all these provinces and the neighbouring countries there is not only a certain analogy, but also a certain opposition: just as related tints accord less with one another than decidedly opposed colours, or as the deadliest feuds are those that exist between persons connected by blood. Thus Iberian Gascony hates and detests Spain, which is Iberian also. Provinces such as these, analogous to and yet different from each other, and which are those that France opposes the first to foreign force, offer against all attacks a resisting or neutralizing force: they are different powers by which France is placed in contact with the world, and has a strong hold upon it. Go on then, France, in beauty and power; throw out the long waves of thine undulating territory to the Rhine, the Mediterranean, and the Atlantic; thrust forward against hardy England, bold Brittany and tenacious Normandy; oppose to grave and solemn Spain the derision of the Gascons; to Italy the fire and impetuosity of the Provençaux; to the massive empire of Germany the solid battalions of Alsace and Lorraine; to the boasting and choleric of Belgium, the dry sanguine ire of Picardy, and the sobriety, the reflection, the disciplinizing civilizing spirit of the Ardennes and Champagne!

"To whoever passes over our frontier, and compares France with the countries that surround her, the first impression is not favourable. There are few sides on which foreign countries do not seem superior: thus from Mons to Valenciennes, or from Dover to Calais, the change is a painful one: Normandy is England, a pale copy of England: what are Rouen and Havre for trade and manufactures compared to Manchester and Liverpool? Alsace is Germany, but without that which constitutes the glory of Germany,—universal knowledge, philosophical profoundness, and poetical naïveté. France, however, should not so be taken, piece by piece; she must be embraced as a whole. It is precisely because her centralisation is powerful, her common vitality strong and energetic, that her local vitality is feeble. I would even say that this constitutes the beauty of our country; it does not possess, it is true, such a mass of cultivation as England, strong beyond belief in industry and wealth, but then it has not the deserts of the Scottish Highlands, nor has it the cancer of Ireland; there are not to be found in it, as in Germany and Italy, twenty centres of science and art; it has only one centre, one common point of social life. England is an empire; Germany is a country, a race of men; France is a person.

"Personality, unity,—these are the qualities by which rank is obtained in the scale of beings. I cannot give a better explanation of my meaning than by employing the language of physiology. Amongst animals of inferior orders, such as fish, insects, molluscæ, and others, local vitality is strong. In the language of a learned naturalist, M. Dugès, 'Each segment of a leech is found to contain a complete system of organs, a nervous centre, vascular anse, a pair of gastric lobes, respiratory organs, and seminal vesicles; and it has been remarked that a segment can live for a certain time though separated from the others. But according as we mount in the animal scale we see the segments uniting themselves more intimately to each other, and the individuality of the whole more clearly defined. Individuality in composite animals does not consist merely in the soldering together of all their organized parts, but rather in the common play of a number of parts, a number that becomes greater and greater according as we approach the higher degrees. Centralisation becomes more complete according as the animal mounts in

the scale.' Nations may be classified, in this respect, like animals; the common play of a great number of parts, the joint union and responsibility of these parts among themselves, the reciprocity of functions which they exercise with regard to each other, these are the qualities that constitute social superiority. This is the superiority of France, the country of all others where nationality or national personality makes the nearest approaches to individual personality.

"To diminish, without destroying local individual vitality, for the benefit of the vitality that is general and common to all, involves the problem of human sociability;—a problem, to the solution of which the human race is daily making nearer and nearer approaches. The forming of monarchies, of empires, is one of the steps by which the solution is to be attained: the Roman empire was a first step; Christianity was another; Charlemagne and the Crusades, Louis XIV. and the Revolution, together with the French empire that sprung out of it, all these were so many new steps in the same route. The best centralized people is that which by its example and the energy of its action has done the most for advancing the centralisation of the world. This unification of France, this annihilation of the spirit of provincialism, has been frequently looked upon as the simple result of the conquest of the provinces. Conquest, however, though it may fasten and chain together hostile parts, can never form an union between them. Conquest and war only opened the provinces to the provinces, they only gave isolated populations an opportunity of becoming acquainted with each other; the lively and rapid sympathy of the genius of the Gauls and their social instinct did the rest. Curious as it may seem, these provinces, so different in their climates, their manners, and their language, have nevertheless understood each other, have conceived a mutual affection, and felt themselves to be component parts of a great whole. The Gascon has got accustomed to be anxious about Flanders; the Burgundian to be rejoiced or grieved at what may be doing at the Pyrenees; and the Breton, seated by the shores of the Atlantic ocean, to feel the blows that are struck on the Rhine. It is thus that the general, the universal spirit of the country has been formed; the local spirit has been disappearing day by day; and the influence of soil, of climate, and of race has yielded to the action of the social and political system. The fatality of locality has been overcome, and man has escaped from the tyranny of material circumstances. The Frenchman of the North has got a taste for the South, and has warmed himself in its sunshine: the Southern on the other hand has assumed something of the tenacious serious contemplative turn of the Northern: society and liberty have subdued nature, and history has effaced geography. In this marvellous transformation, spirit has triumphed over matter, generalities over individualities, the ideal over the real. Man as an individual is given to material things, and attaches himself readily to local and private interests; human society on the contrary is given to spiritual things and ever tends to free itself from the paltry trammels of local existence in order to attain the high and abstract unity of a country. The more deeply we plunge into ancient times, the more distant is our removal from this pure and noble generalization of modern days. The barbaric epochs present us with scarcely any thing but what is local, individual, and material; man still holds to the soil, is engaged in it, and seems to form part of it. The history of those periods seems to concern the land, and the distinction of races is itself powerfully influenced by it. By degrees, as

we shall see, the force that is peculiar to man will disengage him, will root him up, from the land; he will come forth from it, will throw it away from him, and will disdain it; he will require, instead of his native village, his town, or his province, a great father-land by which he may himself count as something in the destinies of the world. The idea of this country, an abstract idea which is but little indebted for its existence to the senses, will lead him by a new effort to the idea of a universal country, the city of Providence."—vol. ii. pp. 121—129.

These passages, which we have cited at considerable length in order to make the reader the more fully acquainted with M. Michelet's style, are too beautiful, too dramatic, to need much comment of our own. We need only say that the same strain of poesy pervades almost every page of his book; that as the reader turns over leaf after leaf he finds new views opening to his sight, new methods of treating matters of previously well-known historical celebrity, and everywhere the most cheering and amiable display of candour, moderation, and conscientious judgment.

It is impossible to peruse these volumes without feeling a regard for the author that increases the farther we advance in them. Not that we would by any means assert that *all* his views will be adopted; or that his dicta are everywhere to be received with implicit deference. For ourselves we beg leave to dissent,—but we feel it necessary to apologize for so doing,—from two of the favourite doctrines of M. Michelet, and indeed of the modern French historical school in general; we mean the advantage of the system of Centralization as existing in France since the period of the Great Revolution: and that of Hereditary Equality, or the theory of an equal division of property among heirs after the possessor's death.

With regard to the former, the Centralizing System, some apology may be found for the conduct of the first promoters and advisers of it, in the scandalous administrative system which had so long prevailed in France, and by which the oppressed inhabitants had been involved in such a confusion of fiscal and judicial iniquity, that almost any system was better than the one to which they were subjected. The fact is, that the provincial parliaments, which had originally served as bulwarks of liberty, and might have been made good instruments of local government, had lost their importance since the gradual diminution of the moral influence of the aristocracy, and had been converted into ready instruments of regal oppression. The people were burthened with unfairly divided taxes; they knew their aristocratical chiefs only as absentees, and they received little protection from those who

ought to have been their natural defenders against the indiscriminating tyranny of the court. The clergy too had pushed the selfish feelings and unnaturally abstracted system of the Church of Rome too far, and, like the nobles, had lost much if not almost all their restraining and civilizing influence over the masses of the population from two causes, teaching the Romish system in preference to the fundamentals of Christianity, and their current notion that Papacy was adequate to oppose the power of rationalism and the expansive spirit of the times: the seeds of civil dissolution had in fact long been sown, and the time for their bursting forth was fully come when the Revolution arrived. But the legislators of that period went too far: like other men under similar circumstances they knew not how to cut away the rotten parts of the system, and to leave the good untouched; like improvident builders they levelled the venerable edifice that had stood so many ages, without knowing whether they could ever erect anything half so good in its place. In their wish to remove what was bad, they took away all that was good at the same time; to make the life of the people more tolerable, they took away all that was worth living for. There is no doubt that the taxes of France at the present day lie lightly on the country, that they are fairly apportioned, and that their produce finds its way with comparatively little loss into the coffers of the State. It is certain that the energies of government in all the various branches of administration are exerted with rapidity, and that very little of the power of the great social machine is wasted. But if we look at the practical results of this system to the people themselves, we shall find that after so many years of bloodshed and misery they are not much better off now than they were at first, and that their liberties, specious enough on paper, are not more respected in practice than under the old régime. Allowance must of course be made for what the old system might have effected, if left to itself to amend, to expand, and to change in proportion with the general progress of civilisation; but, when such allowance is made, we maintain that the new system has not done more for the nation than the old one would, had it existed fifty years longer. The people before the Revolution had been abandoned by the nobility to the tyranny of the government; but by whom are they now protected from a worse tyranny,—from their own? They were exposed in former times to the rapacity of local administrators, civil and military; but what have they gained if the central administration of the capital can act

on them through its legions of civil functionaries, and its immense army, which after all has to be supported by the cultivators of the soil? *Lettres de cachet* no longer exist, it is true: but what is gained when a *mandat d'arrêt* and the obsequious verdict of a packed jury,—the Chamber of Peers,—can consign any individual accused of conspiring against the State, first, to a long preventive imprisonment, and then, after the phantom of a trial, in which judge, jury, and prosecutors are all jumbled up together, to perpetual incarceration?

The people of France were not represented very efficiently in the provincial states, it is true; but are they much more so in the present Chamber of Deputies? Bribes and fees and the conferring of public offices for undue purposes were no doubt part of the system of former days; but can the actual system of French government be said to depend on any thing else? could the present order of things stand for a single day before the irritation of the people but for the influence of the ministry for the time being, that is to say the crown, acting first on the host of placemen in the chambers, and then on the locust swarm of functionaries of all kinds that prey upon the country? It is our full conviction that, though the trading classes of the community may have received a great development from the results of the revolution, the great masses of the people are not happier nor better off than they were under Louis XVI. In the mean time local energy is destroyed; local means of resistance are annihilated; let it please two or three hundred of the the rabble of Paris to get up an *émeute*, and the whole country runs an imminent risk of having its whole future destinies changed; let it please some political fanatic to terminate the life of the present chief of the state, and the peaceful inhabitants of the remotest provinces are not sure but that the armies of coalesced Europe may again be sweeping over their plains within a year's time. Could the people have been more exposed to the faults of government under the old system than they thus are under the new?

It is true that a decentralized government, quoad a government, may not have the same strength and vigour as a centralized one; and no one can doubt that it would take much longer time to get any administrative measure carried into effect in Germany, in Spain, or in England, than it would in France; but what the government loses the nation gains. The government may not be so powerful, but the people may have more innate vigour, and more national spirit; it may not be quite so easy work for the Bureaucracy, but it is much better for

the flesh and bone of the national, for the people, for the owners of the land and the other property of the country, and for those whose possessions consist in the produce of their arms or heads. The capital of a centralized state may be more brilliant than that of a decentralized one; but the former will have only one capital, the latter will enjoy several. France has only got Paris; England has not only London, but in her sister countries she has Edinburgh and Dublin; Germany has capitals by the score; Italy by the dozen; even Spain possesses several. Annihilate Paris, and France is removed from the assembly of nations; let Vienna or Berlin be swallowed up by an earthquake, Germany has only one city less. The general vigour that the decentralizing system always keeps up, is strongly exemplified in Spain; that country where the upper classes are the most degenerate and demoralized in Europe, Portugal and Italy excepted, where the population is in a state of the lowest ignorance, and it might almost be said misery, where the country is underpeopled and uncultivated, and where according to the French system all the elements of a nation are wanting; yet what vigorous resistance can the Spaniards oppose to foreign invasion! what an indomitable attachment to their own country the people retain, what numberless rallying points they have throughout their provinces. Had France been invaded by an army bearing the same proportion of numbers and moral influence towards the nation that the French army did when in Napoleon's time it occupied Spain, the chances are that France would never have liberated herself from thralldom; even Napoleon himself, and, since that great man, the Bourbons, experienced the fatal effects of the central action of the capital paralysing almost instantaneously all the efforts of the nation, and cutting off every hope of subsequent demonstrations in their favour. If the boasted invasion of England during the late war had taken place, if London had fallen into the enemy's hands, would the two islands have thereupon submitted to the foreign intruder? Did Napoleon conquer Russia merely because he took Moscow? And again, in a social point of view, what is it that gives so much superiority to the other countries of Europe over France? what is it that makes life so much more agreeable in Germany, in Switzerland, in Italy? what but the healthy vitality, the intellectual and political movement to be found in some quarter of those districts? Supposing that Paris did not exist, who would go to France?

The Equalization System—the equal di-

vision of property after death—is in our opinion one of the most dangerous diseases to which the French body politic is exposed: the centralization system tends to destroy all local energy, but this attacks and undermines all individual exertion. Far from being, as it was supposed it would be, one of the main bulwarks against political oppression, it has done nothing more than substitute one kind of oppression for another. It has rendered the existence of an aristocracy impossible; but it has not hindered the existence of corrupt and oppressive governments of every denomination. The fact is that a mob of peasants, still more of petty manufacturers or shop-keepers, can be as tyrannical and capricious as the most absolute despot; and that a mob government, however liberal its professions may be in the first moments of enthusiasm consequent on a revolution, can soon degenerate into a slow and wary system of general jobbing and corruption. How abundantly is this exemplified by the history of France ever since 1789! What a melancholy reflection is it to the historical student to contemplate the complete break-down of every political character in France who has attempted the carrying out of the principles of either revolution to their ultimate consequences! The equalizing of the fortunes of a people, in so far as it can be carried into effect, while it lays all men prostrate to the political Juggernaut of the day, added to the destruction of local spirit by the centralizing system, is a fatal check on all efforts at agricultural and even manufacturing or industrial improvement. Is there any, even a small operation of this kind to be done in France, nothing but a company can be resorted to, nothing but the chances of the stock exchange can be allowed to decide on the fitness or practicability of the enterprize. France, if the intellectual acuteness of her people be considered, is the most backward nation of the civilized world in an agricultural or a commercial point of view. On the other hand, while the people are deprived of their natural friends and protectors, the members of an aristocracy, and while they are subjected to the unmitigated action of the executive, they are exposed, an unresisting prey, to the “fangs of the law.”

By the general subdivision of landed property that now exists in France, it has come to pass that a man's land lies sometimes so split up into small parcels, and at such distances from each other, that his whole time would be taken up in moving merely from one part of his commune to another: and he cannot exchange parcels at a distance, for others lying nearer home, because the

law-costs, stamps, &c., necessary for such a transaction, are so heavy, that for a piece of land yielding not more than *ten* or *twenty* francs a year in raw produce, he would have to pay *one hundred* francs for the conveyance of it! There are made in France every year about 250,000 mortgages of 300 francs and under, the duration of which is for one year, or two years at most. The cost of each of these mortgages is 31f. 60c., so that for one year the expense amounts to 10 1-2 per cent. The total cost of conveying land and of drawing up other documents connected with freehold property in France, is 100 millions of francs per annum, paid, be it remembered, in great part by the poorest class of landowners. The consequence is, that the whole country is overrun by lawyers, and officers of the law; notwithstanding which it is not a whit the better cultivated or better managed. We know that for the present the peasantry are happier and perhaps better off than they are in England: but the question is, will they always be so? Sixty years is nothing for the trial of a great national experiment, it is true; but enough has come out of the equalization system in France to render another revolution and a republic inevitable within the next half century, or else a most extensive alteration of the law that causes the mischief. The law of equalization is not a bond of union: it is one of political discord and degradation. In so saying, we wish no harm to France: on the contrary, we wish her all prosperity and happiness; but it is of essential importance to all nations to indicate the fatal diseases under which she is labouring.

We are compelled to conclude our notice of M. Michelet's interesting and most valuable history, by mentioning that the subject of the suppression of the order of the Templars is treated in the third volume in a highly luminous and impartial manner; the author is indeed commissioned by the French government to publish a complete collection of documents relating to this historical event:—the wars of Edward III. also occupy considerable space in the same volume. The fourth treats of the disastrous reign of Charles VI., and ends with the death of that unfortunate monarch and of Henry V. of England.

6. *Das Neue Testament deutsch durch Dr. Martin Luther, veranstaltet von der Buchdruckerinnung zu Leipzig.* 1840.

It would have been an easy task to lengthen the list of the works that appear in commemoration of the approaching fourth centenary anniversary of the discovery of printing, for their name is legion, and Midsummer-day is looked forward to in all parts of Germany as a day of national rejoicing, nor is it easy for any one residing in that country to escape the enthusiasm that pervades all classes and ranks. Wherever you go, Gutenberg busts and Gutenberg pictures stare you in the face, and the papers are filled with advertisements alluding in some way or other to the engrossing subject. Nor is the ridiculous wanting. Catchpenny articles are manufactured, and tradesmen allure their customers by christening their wares after the hero of the day. Gutenberg pipes and Gutenberg sticks, Gutenberg caps and Gutenberg handkerchiefs, Gutenberg beer and Gutenberg schnaps attest the popularity of the printer of Mayence. The booksellers and printers of Leipsic, as in duty bound, take the lead. Let us, however, retire for awhile from the noise and bustle of their preparations, which we shall notice hereafter, to contemplate the use which the Germans make of the press, and the manner and spirit in which their ancestors in bygone centuries celebrated the great discovery fraught with inestimable advantages to mankind, the invention of the art of printing.

To us there is something remarkably pleasing in the celebration of this jubilee, connected as it is with benefits not conferred on one language or nation, but extended to the whole civilized world. Almost all national feasts have something selfish or exclusive, are in honour of some event gained at the expense of bloodshed or misery to thousands of our fellow-beings; there is hardly one on which the beneficent and phi-

losophic mind can look back with unmixed pleasure, but in this all men may for a moment look upon each other as brethren, undisturbed by national prejudices or melancholy retrospect.

It may at first sight appear singular in the eyes of Englishmen, in the full possession of a free press, and accustomed to consider it principally with reference to politics, that the Germans, who enjoy this advantage but in a very slight degree, should be almost the only nation in Europe to celebrate the return of this jubilee as a subject of universal rejoicing. And yet perhaps it is this very circumstance in connection with some other features of the German character that produces this apparent anomaly. We are only then in perfect enjoyment of any particular blessing, when all reflection upon it is absorbed by the reality of the blessing itself. The English seldom boast of the freedom of the press or of their constitution, because they cannot think of England except with these advantages; they form part and parcel of their very nature as Englishmen. But the Germans are a more reflecting people, it is part of their nature not to enjoy without reflecting on the nature of the enjoyment, and their contemplations on the approaching jubilee are doubtless not unmixed with aspirations which we hope may soon be realized. The state of their political press is such that we might at first wonder how a nation, eminent for genius, humanity and love of justice, and by no means insensible to freedom, could rest contented with such a state of things.

We are so accustomed to outward comforts, practical energy, and the liberty and occasionally to the licence of our press, that we are disposed to undervalue the simple habits, the sedateness of character in the Germans, and above all, to ridicule the inanity of their daily press. A thinking mind would go further, and inquire whether the two former had not likewise their advantages, and be apt to conclude that there must be somewhere an equivalent to counterbalance the defects of the latter. It will rarely be found that nature is unjust; she dispenses her blessings with an even hand; and although the liberty which she offers may not in all countries be arrayed in the same garb, she will not be found to have denied the gift to a nation eminently worthy to receive it. The freedom of the Germans is to be found in their universities and their philosophical speculations.

We are too fully engrossed by our party questions, too much occupied with the present, too closely pressed by material interests and threatening symptoms from with-

out, to appreciate at once all the merits of the German philosophers and scholars. The politician may deride the colourless reports which the censor allows to pass—the man of fashion may look contemptuously on coats not made by Stultz, and on manners hearty and simple, not formed in the d'Orsay school,—but the meditative and reflecting will look with respect, and perhaps with shame, on a nation from one of whose youths Coleridge imbibed* those opinions which obtained for him the high reputation which he enjoys in his native country as a profound thinker. The true model of the German character, its noblest representative, is the German gelehrter. Unfettered by politics, not harassed by the galling ties of party connection, he pursues the even tenour of his way with a one-minded singleness, neither swerving to the right nor to the left, careless of the results to which his speculations may lead; troubling himself as little about their practical application as Archimedes of old, he follows out the ray which truth detects, and in the unshackled freedom of investigation permitted to him in speculation, he forgets the narrow bounds prescribed to him by the timid policy of the Diet at Francfort. True it is that this freedom of speculation may occasionally degenerate into error, but even error is but another incentive to the pursuit of truth; for he would be but an unworthy votary of philosophy who could for a moment admit the supposition that error could be finally victorious. *Magna est veritas et prævalebit.* It is from this point of view that we must explain the appearance of such works as that of Strauss, which has so much shocked the orthodox; but we think it redounds more to the honour of the German governments that instead of proscribing the work,† and thereby investing it with the popularity of martyrdom, they called upon the divines to refute it.

This, then, seems to us the peculiar and honourable province of the Germans, the diffusion of ideas in speculative philosophy, which, worked out in their practical applicability by nations whom Providence has more highly favoured in this latter respect, return thus modified to their original coun-

* We say imbibed, because although we have read with pain an article on the subject (written in a very proper style), in a recent number of Blackwood's Magazine, we cannot bring ourselves to believe that Coleridge was *knowingly* guilty of the plagiarisms from Schelling, there proved against him.

† The question was discussed by the Prussian government, when we believe that the estimable Bishop Neander gave it as his opinion that the work ought not to be proscribed, but refuted; a decision the more honourable, as he himself has published a life of Jesus Christ to prove his sincerity.

try, there to create new impulses, and give a more active direction to social and political life. This of itself would be sufficient to account for the high value which that nation sets on the press; and when we add that every child is there obliged to learn to read, we shall not be surprised at the interest taken in the celebration of a festival, so much in unison with the cosmopolitan character of the Germans.

It will not be uninteresting to mark in the different celebrations the gradual changes in national habits and manners, and it is equally gratifying to trace the progressive improvement in the national condition, from the simple, we may almost say doubtful meeting, in 1540, when the spirit of the Reformation was abroad, to the costly preparations for the jubilee in our nineteenth century.

The accounts which we have of the first celebration in 1540 are meagre and contradictory. Werther, in his *Veritable Intelligence* on the art of printing, is of opinion that the printers of Wittenberg, Michael Lotther, Hans Lufft, George Rhau, and Peter Selze (likewise spelt Seitz, Saltze) all distinguished in the literary history of the Reformation, in company with their workmen, celebrated the first *Jubilæum typographicum* on St. John's day as Gutenberg's name day. Eichsfeld, indeed, in his relation of the jubilee at Wittenberg in 1740, affirms that there are no grounds for this assertion, but later writers assume it as authentic. There is likewise a tradition that some friends, and amongst them Luther and Melancthon, were present at the festival in Lufft's house; and a learned friend informs us that there is supposed to be an allusion to it in one of Luther's letters. In the other parts of Germany there was no celebration.

Notwithstanding the badness of the times and the devastations produced by the thirty years' war, the printers celebrated a jubilee in 1640 at Leipsic, Jena, Breslau, and doubtless in other cities. (Strassburg seems to be the only city in which the discovery of printing was celebrated every fifty years.) On this occasion Leipsic took the lead; and as the *Jubilæum Typographicorum Lipsiensium*, published in 1640, contains the only report of this festival, we shall make a few extracts from it, as the humble tone of piety in which it is written will doubtless please our readers better than the noisy doings and pedantic sayings of old father Gottsched a century later.

"That the praise of God may resound the farther, and that dear posterity in all places may be cheered to holy imagination, they (the printers of Leipsic) have thought it good and advisable to discover this

their intention to their fellow craftsmen, whether they might perhaps be pleased to celebrate the jubilee with them; and accordingly, in April of this current year, they issued friendly and brotherly epistles to the same in several noble cities of the empire, ports and commercial towns, but particularly the far and wide celebrated city of Strassburg, which is renowned as a mother and native city of the inventors and beginners of this worshipful art, as also to the noble universities of Wittenberg and Jena, sufficiently unfolding to them their Christian intent, and exhorting them to equal thankfulness to God under all changeableness of circumstances; almost all of whom have cheerfully accepted and willingly agreed to like joy in the Lord and celebration of such feast."

The poor printers of Wittenberg were not, however, able to gratify their wishes by a public celebration, from their great poverty and indigence; nevertheless they determined to meet,

"because the printers of Leipsic commemorate this year, and because printing was discovered two hundred years ago, to thank God for this benefit, and in friendly talk to take a drink and frugal meal together in stillness. God grant that this noble art may soon recover from the distressed state to which it has been reduced in these bad and ruinous times of war."—*Eichfeld Relation of the Wittenberg Jubilee in 1740.*

The anonymous author of the Leipsic Festival informs us that

"The above-mentioned printers and their fellow craftsmen have agreed to celebrate this feast on the day of St. John the Baptist, for the following reasons: firstly, because both the praiseworthy discoverers and beginners had this name, and the one is called John Gutenberg, but the other John Faust, as amongst other matters will be recorded in the German oration here annexed, therefore this their name day hath been hereto chosen in honourable commendation of them; and secondly, because they would avail themselves of the loveliness and convenience of this season of the year."

That their "Christian intent" might not be imputed to them as unseemly presumption and a self-chosen service, they had communicated it to the superintendent and clergy "who did not only express themselves well pleased with the same, but likewise his reverence the superintendent, in the morning sermon of the aforesaid St. John's day, did excellently commend and laud this art and its great and manifest utility, as likewise its inventors and improvers, exhorting his hearers to thank God heartily for this high and great benefit;" which example was likewise followed in other churches in Leipsic and the neighbouring towns.

The printers then went to church in due order of procession, where, we are informed, they listened in zealous devotion, and *waited even to the end*. Afterwards they met together, and in Christian conversation discoursed of the great deeds of God, but particularly of the wonderful invention, ad-

vancement and gracious preservation of this worshipful and excellent art. The guests afterwards assembled "in a room of seemly dimensions, adorned with trees, fair flowers and sweetly-smelling grass, and looking into a goodly garden," the men being placed to the south, but the women "in excellent order, by themselves, to the north," to hear a German oration. True to their original design of celebrating this feast, in token of a grateful mind, to the honour and praise of the Lord God, with such piety and devotion, that, although after service they should meet at a public dinner, all licentiousness, dancing* and improper speaking was forbidden under pain of severe punishment.

"The ladies and gentlemen present, together with the cantor and organist, were in a friendly manner requested to continue the praise of God to the end of the day, after which they sat down to table, and, grace being said, enjoyed the gifts of God in cheerfulness, yet all conducted themselves with becoming seriousness and respectably in Christian devotion to the honour of God."

In this humble and thankful spirit, singing psalms and hymns and spiritual songs, did these pious printers celebrate the discovery of their art, and we hope that the three thousand guests at the festive board, in the elegant building erected for the present occasion at Leipsic, may have equal cause to say that the day ended without "vexation or disappointment."

We have, however, some slight misgivings, for Rhine wine and Champagne will abound, and our very good friends the bibliopoles have not hitherto shown any great affection for the doctrines of the tee-totallers.

Turn we now to the last jubilee of 1740. German literature was at a very low ebb. Pedantry and selfish conceit were the only qualities that distinguished the men who were then looked upon as heroes, but who are now only remembered as laughing-stocks. In the absence of genius, the most ridiculous rules and canons of criticism and poetry were laid down; philosophy there was none, or it was considered but as synonymous with what is generally called common sense.

In most periods of literary history and intellectual development there are two great phases which succeed and complete each other in beneficial alternation. A few favoured spirits in advance of their age, breaking through all acknowledged rules, produce masterpieces for the admiration of their con-

* The contrast between the manners of the olden time and those of the present day is strikingly displayed in the fact, that whilst in 1640 dancing was strictly forbidden, the printers of 1840 will conclude their celebration by arranging a Volksfest, or kind of fair for the amusement of the people on the third day of the festival.

temporaries ; and nature, as if exhausted by the birth of her favourites, or perhaps in benevolent compassion to the mass of mankind, reposes, to give them time to become familiar with new forms and new ideas. Thus criticism and common sense never contribute to the production of genius, but genius, heaven-born, gives a new standard to the direction of taste. But in the period of which we are speaking the state of things was comfortless in the extreme. With no mighty models to purify and exalt the national taste, the language was reduced to a flat unmeaning level, only varied by a piebald mixture of foreign words from the French, at that time the language of the German courts, and of Frederick the Great. All that could be expected was, that the nation would at last become aware of the empty nothingness of the Aristarchuses, who, with characteristic pomposity, doled out their tedious pedantry. A great step was already gained when Bodmer and the Swiss, the antagonists and conquerors of Gottsched, found out that bad was bad. Once discontented, the inherent activity of the human mind will proceed in restless agitation, until kind nature, finding her pupils worthy, or at least desirous of her gifts, applies a remedy. The good Germans long groped in the dark, and what will our readers imagine was the model of excellence which the Swiss party, undoubtedly in earnest, after serious deliberation, proposed for imitation ? Neither more nor less than the *Fables of Esop* ; and strange as it may appear, we find even Lessing himself, one of the clearest heads of the last century, doing homage to this national conviction.

We cannot do better than quote the singular logical process which led to this extraordinary result in the words of Goethe :—

“No fundamental principles of poetry could be found, it was too intellectual and evanescent. Painting, an art which we can follow step by step with our outward senses, appeared more favourable. The English and the French had published theories on the fine arts, and it was believed that through analogy with these poetry might be established. Painting placed images before the eyes, poetry before the fancy : poetical images were then the first thing to be considered. They began with images, descriptions followed, and whatever could be apprehended by the outward senses was discussed.

“Images then ! Where were these to be taken except from nature ? The painter clearly imitated nature ; then why not the poet ? But nature as it lies before us, cannot be imitated ; it contains so much that is insignificant, or unworthy : a choice must be made, but what shall decide the choice ? We must look only for what is important ; but what is important ?

“The answer seems to have puzzled the Swiss for a long time, for they hit upon a strange, yet pretty and merry idea, that the *New* is always the most impor-

tant ; and after considering awhile, they find that the Wonderful is always newer than anything else.

“They had now collected the requisites for poesy ; but one objection occurred, that the Wonderful might likewise be void, and without reference to man. But this necessary reference must be of a moral nature, and from this followed manifestly the amelioration of mankind, and thus a poem had attained its object, when in addition to all its other qualities, it became useful. The different kinds of poetry were to be examined according to the requisites here collected, and that which imitated nature, was at the same time wonderful, and had a moral aim and utility, was declared the first and best. And after much consideration, this great preference was with full conviction assigned to the *Fables of Esop*.”—*Goethe's Works*, vol. xxv. pp. 77—79.

The state of things, worse than the severest satire, thus described, refers to a [period somewhat later than our present jubilee, but matters were, if possible, then still worse. Old Gottsched, the Aristarchus of Leipsic, was chosen to deliver the German oration, and so great was the desire to hear him, that men climbed in at the windows by means of ladders ; professors of the highest rank were unable to get through the crowd, and returned without enjoying the set phrases of the old pedant, and the adjacent street was thronged with an immense multitude.

Our readers will easily imagine that the oration delivered by the man, who, puffed up by his own vanity, was far behind the admirers of Esop, was totally unworthy of the enthusiasm which prevailed, although it was doubtless highly admired. And according to the ideas of the times, it was a model of composition. A regular introduction of some eight or ten pages, a due oratorical confession of his own weakness, which he would have knocked any man down for admitting ; and then, not rushing rudely in medias res, but beginning according to the approved German system *ab ovo*, which on the present occasion is synonymous with Saturn, he enumerates the discoveries of other nations, which of course vanish before the German invention. The list of celebrated Germans fills him with such enthusiasm that he can “*hardly* refrain from offering up his thanks to Divine Providence for being born in a German *volk und land*.”

The conclusion is characteristic. After wading through some fifty pages he begins his eulogy of the printers present, and asks them, what *affecting* observations can I introduce in the conclusion of my discourse ? Does not the number of your presses in the town exceed fifty, &c. &c.

Poor Gottsched lived to survive his reputation, and his name is now only remembered as a by-word for arrogance and pedantry.

In leaving this uncheering period, and casting a rapid glance at the revolution which

the last century has operated in Germany, so great have been the changes, so extraordinary the progress, that we can hardly imagine we are speaking of the same people. In the extract from Goethe quoted above it must have struck the most careless reader that nothing proceeds from the mind within, all proceeds from external impulse ; yet this same nation is now distinguished above all others for its investigations into the operations of the human mind ; a long and illustrious series of poets, critics, historians, does honour to the German name ; music stands unrivalled, and painting and sculpture flourish. As if to present the most complete contrast to the period we have just quitted, the whole direction of the German mind, with an elastic rebound, seemed to strive to penetrate the hidden recesses of things, and the very existence of the material world was, as with Berkeley, doubted. Napoleon too, by his gigantic ambition, reduced the German nation to a state much similar in politics to what it was in intellect a hundred years ago, and thus a *tabula rasa* being formed, and so many incumbrances of the unwieldy German empire having been swept away, it will be the fault of the Germans themselves if they do not improve these advantages.

In literature the great spirits have passed away, and their mantle has not fallen upon their successors. Yet if Germany cannot boast of great and creative writers, what nation can at the present moment ! The period of steam-ships and railroads is not favourable to the quiet workings of genius. It creates too many ideas in other directions, beneficial likewise to mankind (unless they generate a too great fondness for gain,) and Germany has obeyed the common impulse. But there is a great and general literary activity. The national taste has improved by the study of their great models : instead of slavishly adopting a foreign language as the medium of conversation, the Germans have become sensible of the great beauties of their own, and Grimm has raised a monument to the historical development of the language which other nations must look upon with envy and regret.

The diffusion of education has become general, we might almost say universal, as every child must learn to read, the book-trade (notwithstanding the fears of the good printers two hundred years ago that printing could advance no further,) has acquired an immense expansion, commerce is extending, wealth, or rather competence, more generally diffused, a sense of comfort gaining ground, and, therefore, it was natural that Leipzig should make preparations for celebrating the

present jubilee on a scale far surpassing the modest festivals of the two former centuries. The printers have, by weekly contributions for the last four years, raised a considerable sum ; the city has voted a sum of three thousand dollars ; the booksellers have been liberal in their donations ; so that there is no want of funds. The feast will be celebrated from Switzerland to Norway ; but whilst in most other cities it partakes more of a private character, in Leipzig, as the literary mart, it will be truly a national jubilee.

Little has occurred to us in the preparations of the other cities that could interest the English public ; but it may not be unworthy of remark, that the committee at Halle have fixed upon the 18th instead of the 24th. The Roxburgh Club will doubtless be flattered with the compliment, that the eve of the 18th has become celebrated by the institution of their society, and all Englishmen will read with pleasure that the anniversary of the battle of Waterloo, which restored liberty to Germany and Europe, has been chosen to celebrate the peaceful festival.

But to return to Leipzig. The following extracts from the Report of the Committee will sufficiently explain the objects and arrangements of the Directors.

On the 23d of June, the committee meet in the Commercial Exchange to receive the more distinguished visitors, and the deputations of the foreign universities, &c.

On the 24th the bells will ring a merry peal, and the morning will be ushered in by music from the church towers, and by a reveille through the streets. At eight o'clock the magistrates and different companies, with all their guests, walk in procession to hear divine service in one of the churches. At ten o'clock the great festive procession will proceed through the principal streets to the market-place, on which three temporary buildings have been erected, one in the centre which is closed, a second with accommodation for 3000 spectators, and a third for the orchestra and singers.

On the arrival of the procession, a cantata composed for the occasion by Mendelssohn will be sung ; at the conclusion of which the building in the centre will be opened, and disclose type-founders and printers in full activity. A song will be printed with the fresh-cast types, distributed amongst the public, and sung in general chorus. At three o'clock about three thousand persons will sit down to dinner in the building erected before the university, and in the evening the town will be illuminated.

The morning of the 25th will be devoted to a *conversazione*, and to an exhibition of all subjects connected with typography ; in

the afternoon there will be a grand musical performance under the direction of Mendelssohn, consisting of a symphony with choruses, composed by him expressly for this feast, and other pieces. In the evening there will be a ball.

The last day will be devoted to public amusements, the committee availing themselves of the funds so liberally placed at their disposal, to give the inhabitants of Leipsic and their guests an opportunity of closing "this great festival in harmless mirth and cheerfulness." The whole will conclude with fireworks, and a procession with torches, which (we mean the torches), according to German custom, will be extinguished on the market-place, amidst music and a general chorus.

The slight sketch in which we have attempted to convey to our readers some idea of the manner in which the Germans have celebrated their different jubilees, will naturally give rise to many interesting reflections on the changes which society has undergone. Whether all these changes are improvements, may be doubted; nor are we so attached to our German brethren as to be blind to their national or social defects.

At a period of general festivity, when we have just been reading their invitation to all "within and beyond the limits of their fatherland" to join with them in a friendly and brotherly spirit in the celebration of our common advantages, it would be ungracious to look at any but the bright side of the picture, and notwithstanding some few dark spots on the horizon, we rejoice that there is cause for sincere congratulation. Although our good wishes will appear in print *post festum*, we doubt not that they will be accepted by our kindly neighbours.

It may not be uninteresting, in conclusion, to notice the progress of printing in Leipsic in the several reports of the jubilees. In 1640 the number of master-printers was only 5, who employed 11 journeymen; in 1740 the number of the former was 18, with 137 journeymen.

Since this time the number of masters has

not experienced any very great increase, but their business has extended itself in proportion to the demands of the reading public, and the improvements which have been made in the art of printing, and it is not unlikely that a single establishment (that of the Brothers Brockhaus), prints as much as almost all the printers of 1740 together.

At present there are in Leipsic 116 booksellers, 9 typesetters, about 20 printers who employ 240 presses (10 of them for machine-printing), 620 journeymen and 200 apprentices. The quantity of paper consumed annually is estimated at present at 12,000 bales, each containing 5000 sheets. These details, although not to be compared with the gigantic estimates published in the interesting article on printing in a recent number of the *Quarterly Review*, display a very respectable activity in a city which contains little more than 40,000 inhabitants. As signs of the times, we may remark that the rage for illustrated works has likewise led to the establishment of two ateliers for engraving, conducted by Englishmen, in which there are about ten Englishmen employed, besides Germans. The recent improvements in printing, and the probable commencement of a new era in engraving, by the multiplication of copies by the galvanic process, indicate that posterity in celebrating the Jubilee in 1940 will have room for self-gratulation in any comparison they may deign to institute with our generation. Should some industrious antiquary, in the zeal of his researches, take down the present number from the dusty shelves to which we fear even our lucubrations may then be consigned, he will at least find it recorded, that, although duly sensible of the spirit of invention which is abroad in our own age, far from imagining that we had attained the height of perfection, we believe ourselves merely at the threshold of improvements and discoveries greatly surpassing the wonders of the first half of the nineteenth century.

MUSIC ABROAD AND AT HOME.

GREECE.

The degeneracy of music in this country may be traced to the absence of heroic or patriotic subjects, and the want of bards to sing them. "If the great musicians of antiquity, whose names are so familiar to our ears, had not likewise been poets, time and oblivion would long since have swept them away. Since writing and practical music have become separate professions, the celebrity of the poor musician dies with the vibration of his strings, or if in condescension he be remembered by a poet or historian, it is usually but to blazon forth his infirmities, and throw contempt upon his talents."—*Burney*. King Otho, as yet, has done little for any of the arts.

The new theatre is nearly completed at Athens, and M. Dametrio Carburì has been sent to Italy to secure a host of talent from the Lombardian and other states. The musical direction is to be conducted by Signor Fontana.

ITALY.

During the last half year eleven new operas have been produced in Italy, emanating from six new composers; of these, four were produced, for the first time, at Naples, three at Milan, one at Rome, one at Florence, one at Trieste, and one at Turin. The new composers are, Travesari, Gravillè, Corbi, Poniatowski, Panizza, and Nardi.

Among the known and admired operatic compositions of celebrated composers, the operas of Donizetti have been the most frequently represented, having been produced at fifty-three theatres, viz.—*Lucia di Lammermoor*, at 12 theatres; *Gemma di Vergy*, at 9; *Marino Faliero*, at 6; *Belisario*, at 6; *Anna Bolena*, at 6; *Roberto d'Evereux*, at 6; *L'Elisir d'Amore*, at 5; *Ajo nell'Imbarazzo*, at 5; *Olivio e Pasquale*, at 5; *Parisina*, at 2; *Pia de' Tolomei*, at 1; *Maria di Rudenz*, at 1; *Gianni di Parigi*, at 1; *Betty*, at 1; *Il Campanello*, at 1.

The operas of Bellini were performed at

seventeen different theatres, his *Beatrice* being represented at eight of them.

Those of Mercadante were produced at ten theatres, his *Gadrialla* was performed at six of them.

Those of Rossini at eight theatres, his *Barber of Seville* at seven of them.

The year 1839 produced the following results:—

New Operas by new Composers.			
At the Carnival	13	5	do
During the Spring	8	6	do.
During the Summer	5	2	do.
During the remainder of the year	11	5	do.

Total 37 new operas, 18 new composers.

From the Musical Journal.

A new opera has been produced at the Pio Istituto, entitled *Ildegonda*, the music and libretto composed by Temistocle Solera, a young man who has had no instruction in music whatever, but report states he was refused the hand of his beloved, the daughter of a rich apothecary living in this city, unless he produced a new opera. He commenced by studying the flute, and has now obtained the prize sought for, by the production of his opera of *Ildegonda*. The music is very simple and melodious, bearing a great similarity to the works of the early Italian composers. This opera was fully successful, but was only performed twice at the Pio Istituto, as the season then terminated. Solera has since left, with his bride, for Naples, where he intends studying the sublime science.

Among the virtuosi of the good old Italian school of music were some highly gifted individuals. The power of abstraction exhibited by one of them is strikingly exemplified in the following anecdote of a *somnambulist composer*. "A young priest in a Catholic seminary was accustomed to rise in his sleep and write sermons; he wrote music also with great exactness, tracing on it at equal distances the five lines, and putting upon them the clef, flats and sharps, afterwards he marked the notes, at first white,

then blackened those which were to be black. The words were written under; and once happening to make them too long, he quickly perceived they were not exactly under the corresponding notes: he corrected this inaccuracy by rubbing out what he had written, and putting the line below with the greatest precision."—*L. A. Muratori della forza della Fantasia umana, Venezia, 1766.*

NAPLES possesses five theatres. *San Carlo*, whose colossal proportions and splendid interior surpasses any thing of the kind in Europe. *Teatro del Fondo*, smaller than the former, but favourable to sound. *Teatro Nicovo* still smaller than the last mentioned, and used alternately for the representation of the opera buffa and plays. *Teatro dei Fiorentini*; Rossini's farce, *La Gazzetta*, was brought out here, and did not succeed. *San Fernando*, which bears a great resemblance to the *Teatro Nuovo*, but is rarely opened. *San Carlino* and *Fenice* are two theatres expressly designed for the populace. Sometimes two representations are given daily to avoid the immense crowd that usually assembles.

NICE.—Paganini expired in this city on the 27th May last. He died without absolution, or extreme unction, and the authorities refused sepulture to the corpse. The great violinist has left his large fortune to his two sisters and the mother of his son, while the latter becomes possessed of the landed property situate in the Duchy of Parma. For some time before his death Paganini had lost the use of his speech. The genius of this artist lay not altogether, as is commonly supposed, in his wonderful performance, replete as it was with every variety of tone, every species of difficulty, and in the whirlwind of his energy taking the hearers completely by storm, but also in the composition; the artful disposition of the several movements, and the scientific construction of the accompaniment, which distinguished all his music, these showed the musician of profound thought and refined sensibility.

GERMANY.

The number of musical publications which have appeared in Germany during the first three months of the present year, have exceeded those published during the corresponding period of last year (1839). Of 729 musical compositions there were 23 orchestral pieces, 37 for the violin, 14 violoncello, 21 flute, 3 other wind instruments, 21 for the guitar, 2 harp, 321 piano-forte, 10 organ, 23 church hymns, 13 concert

pieces, 203 songs, and 10 works on music, (exclusive of newspapers.) Of these, four are works of instruction.

MUNICH.—The first Italian opera performed here seems to have been *Adelaide Regia Principessa di Suso*, by Giulio Riva Medico Veneziano.

PRAGUE.—A new opera, in two acts, entitled *Die Felsenmühle von Estalieres*, the composition of C. G. Reissiger, has been produced with very equivocal success at the city theatre; and a new four-act opera, composed by C. L. von Oertzen, and entitled the *Fürsten von Messina* (Princess of Messina), was produced with unqualified success at Neustrelitz on the 5th ult.; the libretto, from the pen of J. F. Bahrdt, is founded on Schiller's celebrated *Bride of Messina*. This opera will be brought out at Dresden almost immediately.

VIENNA.—Heinrich Ernst, by the death of Paganini, the first violinist in Europe (our friend Ole Bull not excepted), has been performing with considerable *éclat* in this his almost native city, having commenced his studies from the age of eleven years, at the Conservatorium, under the direction of Professor Bohm. His concerts have been overflowing, notwithstanding the tickets for admission were at an unusually high price. The only novelty at the Court theatre was the production of Auber's *L'Ambasadrice*, which was withdrawn after its second representation.

This city possesses five theatres. Two in the city, namely the Burg Theater and the Opera, and three in the suburbs, the *Am der Wien* (formerly known under the celebrated name of Casporle), that of Leopoldstat, and the new one at Josephstat. The Burg Theater is devoted to tragedies, comedies, and other works of this kind. The Opera was formerly undertaken by government, but was so ill-managed that it was necessary in one year to pay from the public funds half a million of florins. Barbaja (the Neapolitan Impresario) had it for three years, and awakened a taste for Italian music by bringing successively before the public, Fodor, Colbran, Mombelli, Eckerlin, Donzelli, Rubini, David, Lablache, Ambroggi, &c. His lease was renewed April, 1826. The Viennese public, like that of London, are not always treated with either first-rate operas or singers once during a period of eight months; those that had the greatest success were by French composers—*Dame Blanche*, *Les Voitures versées*, *Le Maçon*, and Herold's *Marie* (the three last most flimsy productions), although in their library they have the works of Mozart, Weber, Rossini, Carafa, Weigl, and Cherubini!

The Theater an der Wien was sold Dec. 1826, to a creditor, for 147,507 florins.

The Leopoldstat and Josephstat Theatres generally give fairy tales and farces, with national airs, dances, and waltzes.

LEIPZIG.—Since the return of Madame Schroeder Devrient to Dresden, this town has relapsed into its wonted sameness; the operas of *Fidelio*, the *Hugonotts*, *Capuleti e Montecchi*, *Guido et Ginevra*, *Norma*, and *Iphigenie*, have been once more laid aside for the want of performers. Sophie Schloss, the singer who so delighted the Leipzigers during the winter, gave a brilliant concert under the direction of M. David, on the 22d ult., previous to her departure for Berlin.

BERLIN.—At the King's theatre we have had no musical novelty of late. Adam's *Faithful Shepherd*, and his *Brewer of Preston*, continue to attract full houses. Mozart's *Figaro* has been reproduced at the other royal theatre, with the addition of Sophie Schloss as the Countess, in which she reaped loud and repeated applause; she may be considered a great acquisition to the stage, the clear and distinct intonation of her beautiful soprano voice was much admired. Auber's *Fairy Lake*, which had been laid aside, is to be reproduced; the prima donna, Mademoiselle Loewe, will be assisted by M. Beyer, the new tenor from Breslau, who has rendered himself conspicuous by his personification of Sever in Bellini's *Norma*.

SWEDEN.

The first original opera was performed in 1774.

RUSSIA.

ST. PETERSBURG.—Since the production of Adolph Adam's new ballet opera entitled *L'Ecumeur de Mer*, no musical performances have excited more attention than the concerts given by J. B. Gross, who performed two new overtures, a concerted piece, and a fantasia for the violoncello, all his own compositions. The empress, and the *dilettante* of the city who attended his concerts, were loud in their applause.

FRANCE.

A new opera by Leconte, entitled *Stella*, has been produced at Havre, in which the devil figures as one of the most prominent characters, both as to singing and action. The soul of Manfred is carried into hell, from whence he is ultimately rescued by his wife Stella, who carries him with great pomp into heaven. This *soul-stirring* performance was received by an overflowing house with enthusiastic applause.

PARIS.—In this city, as in many others, art and artists are completely at the mercy of the journalists, no fame can be acquired without them, no reputation established without their interference and protection. When Nourrit, the celebrated actor and singer, died, the editor of one of the musical reviews waited on his successor, Duprez, and with a profusion of compliments and apologies, intimated to him that Nourrit had invariably allowed 2000 francs a year to the review. Duprez, taken a little by surprise, expressed his readiness to allow half that sum; but with which the editor was so dissatisfied that he departed, complaining bitterly.

PORTUGAL.

A new opera has been produced at Lisbon, with considerable success, by M. Coppola; it is entitled *Gl' Illinesi*; the principal characters are filled by Batti the tenor, and Coletti the bass singers.

LONDON.

The London season is fast closing, and, as far as we have the means of judging by information from every quarter, it has been the worst, in a musical point of view, known for some years. Laporte, at the Italian Opera House, has not brought forward one *new opera* of the high class (Persiani's *Inez de Castro*, although an ingenious work, is in the main but a selection of passages suiting the voices of the principal singers.) Coletti, an excellent singer, has been seldom heard; he has been thrown in the back ground to make way for Tamburini's perpetual *tours de force*. Rubini is worn out, although highly extolled. If such quivering and twirling as he perpetrates constantly is to be called *singing*, then may all the masters of the art go to school again to unlearn the very first principles of vocalization, and commence *de novo*. The redeeming points in the opera season have been the production of *Figaro*, *Don Giovanni*, and *Il Barbiere*.

The Ancient Concerts have by no means increased in reputation by this year's selections; they have now become a mere arena for the display of the inadequate powers of young and ill-taught singers, while the really established and well tried talent has been studiously kept from the public ear.

The following anecdote of the founder of the Ancient Concerts may not be generally known. "Lord Sandwich might serve as a model for a man of business. He rose early, he often appointed persons to attend him at six o'clock in the morning; and his time from that hour till a late dinner was

wholly dedicated to business; he was very methodical; slow, but not wearisome, cautious, but not suspicious, rather a man of sense than a man of talent; had much real good nature; his promises might be relied on. His manners partook of the old court; and he possessed, in a singular degree, the art of attaching persons of every rank to him. Few houses were more pleasant or instructive than his lordship's; it was filled with rank, beauty and talent, and every one was at ease. He professed to be fond of music, and musicians flocked to him; he was the soul of the Catch Club, and one of the directors of the Concert of Ancient Music; but (which is the case of more than one noble and more than one gentle amateur,) he had not the least real ear for music, and was equally insensible of harmony and melody."—See *Charles Butler's Reminiscences*.

The *Philharmonic* has revived somewhat from its torpidity. The new symphony of Spohr, although not so successful as the partizans of that composer could have wished, was nevertheless well attended. Another by *Strauss* (not the waltzing Strauss) went off extremely well; it is a work highly creditable to the writer. As usual, there has been no attraction in the *vocal pieces*; we again repeat, that *concerted pieces* are the only sure auxiliaries to form a bill where the instrumentation is of such a high order. Could not the directors have a selection from some of Handel's Serenatas, *L'Allegro*, for instance? Or is it possible there may be just so much talent existing as to write some vocal piece purposely for these concerts? But no—they evidently prefer going on in the usual way, according to a plan laid down by certain persons who would seem to have the entire control of the society. The new pianist, M. Liszt, has made what is called a great sensation. His playing is wonderful, full of wild harmonies, extraordinary power of wrist, and uncommon energy. Molique, the new violinist, seems to have the real artistical spirit both in his compositions and playing, but, excepting his estimation among musicians, it will not (we suspect) avail him towards the desirable end of making a fortune here, because it is very evident the British public are always better pleased with charlatanism than real merit, or (to put the case in a milder form) they must have *novelty* at any price, and unless an artist is *very much talked of*, they know little and care less about his performances; his feeling, taste, sentiment, purity of style, &c. &c. are words they hear, but have no power to comprehend.

The German opera at the Prince's Thea-

tre is an attempt to introduce a better order of music than has been heard for some time. If there be a want of that physical power and culture which distinguishes the singers at Her Majesty's Theatre, they have at least displayed considerable ability, both in Weber's delightful opera of "Euryanthe," and in Marschner's opera of "Der Templer und die Jüdin," both of which have been produced for the first time in this country with considerable success. The choruses are of the highest order, possessing that unity of feeling with delicacy and purity of expression, which so distinguish the German choruses from those of the inferior Italian school; the softness and modulation of their voices, now tender and simple like the chorus of outlaws in *Der Templer* "Es zittert im Fruhroth," and then bursting forth into the loud and mirthful strains, as in the hunting chorus of "Bruder wacht," nightly draw forth enthusiastic applause.

Spohr's "Faust," "Jessonda," Weber's "Euryanthe," "Der Freischütz," and others have been given in succession to good houses, although not supported by the best voices.

Drury Lane—The success of the Concerts à la Musard at the English Opera has induced Mr. Eliason, in conjunction with Monsieur Julien, to open this theatre for the performance of instrumental music, with vocal choruses. The favourite quadrilles by Musard, and waltzes by Strauss, with the elegant display of flowers and mirrors, attract full and fashionable attendances every evening. Mr. Charles Kean is in treaty for his theatre.

The season at Covent Garden Theatre closed as it commenced, with a success which the unremitting exertions of the fair lessee to secure and reward native talent fully deserved and rightly maintained. The new opera, compiled from the musical compositions of His Royal Highness Prince Albert, will be one of the chief attractions next season. Madame Vestris has already completed engagements with Farren, Anderson, Miss Ellen Tree, and Miss Rainforth.

Haymarket Theatre.—Under the guardianship of Mr. B. Webster, continues to meet with the same brilliant results that distinguished it during the last season. It is much to be regretted that the proprietor of this elegant theatre should be so lost to his own interest as to refuse Mr. Webster a renewal of his lease. Mr. W. is the only person, save and except Macready, capable of undertaking the management of Old Drury. The new tragedy by Sergeant Talfourd, "Glencoe," or the fate of the Macdonalds, has become a standard favourite.

The English Opera House has been again opened by a company of performers with fair prospects of success. A new piece, entitled "The Three Secrets," and a laughable farce, called "Ins and Outs," form, with the attraction of the Ladies' Club, an interesting evening's entertainment.

The committee of the Sacred Harmonic Society having retraced their ill-advised steps by returning to their original prices, have met with a corresponding increase of public patronage. Mendelssohn's oratorio of St. Paul has been the last performance, and was given in a most masterly style. The choruses have greatly improved.

Olympic.—This delightful little theatre, after a short and prosperous season, under the management of Mr. Butler, who supplied the public with a variety of pleasing trifles, has been re-opened by M. Cloup, the veteran manager of French companies in London. Among other little vaudevilles "La Famille Improvise" has been completely successful.

Queen's Theatre.—Through the spirit and determination of Mr. James, the manager, this theatre is rising considerably in public estimation. Miss Emmeline Montague has been a recent attraction.

Littolf has a power of hand far exceeding that of any pianist except Liszt, and the finished brilliancy with which he touches off the varied difficulties of Weber's Concert Stück entitle him to rank among the first pianists even of this "miracle-working" age.

Liszt is about visiting Scotland, Ireland, and the provinces; he will be accompanied by Mademoiselle Villowen, F. Mori, Lavenue, and Parry, jun.

Beethoven's Battle Symphony, that erst did astound the ears and astonish the nerves of the frequenters of the Old Drury Lane Oratorios, has been performed at the Surrey Zoological Gardens by Mr. Godfrey's band.

Lord Burghersh has likewise written a Battle Symphony, in imitation of the great master; it will be performed at the Philharmonic. A double orchestra is engaged for the purpose.

Her Grace the Duchess of Argyll, Mrs. John Abel Smith, and one or two other ladies of haut-ton, have given musical soirées, at which English music, glees, catches, madrigals, &c. were performed, (styles of composition which no foreign nation has equalled,) and they have produced great pleasure to the lovers of native music. Italian music has for some seasons been the only charm, but the spell having now been broken by the most influential ladies of high rank, we trust the example will be followed, and that

the beautiful structure of English glees, requiring the most artistical singing, will at last regain the place it once held in the estimation of our countrymen.

The great Lord Bacon, amongst other subjects explored by his astonishing grasp of mind, notices the effects of music; he says, (in speaking of dramatic poetry, and the effects it produces on the mind,) "many wise men have thought it to the mind as the bow to the fiddle; and certain it is, though a great secret in nature, that the minds of men in company are more open to affections and impressions than when alone." This is true to a certain extent, but we must recollect that people in company, although by extended sympathy their feelings may be more affected than when alone; yet the numerous interruptions that every frequenter, either of theatres or concerts, must have felt most exquisitely annoying, from nonsensical observations, loud talking, and the usual mixture of vanity and ill-breeding that too often occur to mar the comfort of those who go *purposely* to listen, and know how to exercise that valuable capacity; all this combines to render music or dramatic recitation, when exhibited before a large and mixed audience, rather hazardous as to the appeal to *sympathy*. Fashion, cabal, and personal weariness, are its formidable antagonists, unless you can secure the Utopian boon, an *unprejudiced* auditory.

The following passage is an unanswerable condemnation of the use of chromatic harmony. "For discords, the *second* and the *seventh* are of all the most disagreeable in harmony, the one being next above the unison, the other next under the diapason, which shows that *harmony requires a competent distance of notes*." Had Lord Bacon lived in the present days of improvement of musical instruments, and heard some of the splendid works of a kindred mind to his own, (the immortal Handel,) performed by a band of vocal and instrumental performers, such as is sometimes heard at the Abbey or Exeter Hall, with his philosophical knowledge and excellent feeling upon the subject, we should have had the musical portions of his essay considerably enlarged.

Lover has written some very beautiful songs lately, "Sprite of the Foam," similar in style to "Through the Wood;" "Music bounding," a simple but pleasing melody; and others we have not space to particularize. The Honourable Mrs. Norton is an active competitor, but her style is more sentimental and sustained. The "Midshipman," "The Name," "Song of the Fairies," and "Exile," are very superior songs.

Among the Piano-forte music are Thalberg's principal pieces, arranged as duets, and rather easier to the players in that form. Two fantasias by Döhler, one in E flat, the other a subject from Oberon, evince great musical feeling and tact. Rosellen's fantasia upon subjects from Parisina and La Voliere, are like the style of Hunter's pieces, brilliant and effective, but of moderate difficulty; the subjects are very pleasing. The "Coro Marcia," from Pacini's opera, "I Cavalieri di Valenza," one of his most effective pieces of that style, has been arranged by Mr. Horncastle as a duet. It is brilliant, easy, and adapted for two players of moderate proficiency. The same composer has likewise produced a third divertimento (*Melange Militaire*) for the piano-forte, consisting of a march, waltz, and polonaise; this will be an established favourite among the moderate class of players. Miss Masson's Jacobite songs, "The Blackbird," "Lochiel," and the "Balmoran Rant," are well-arranged revivals of some beautiful old melodies.

Lately published, in 1 vol. royal 4to., "A General Collection of the Ancient Music of Ireland, comprising a Dissertation on the Antiquity and Characteristics of Irish Music and Musical Instruments, together with some Account of various eminent Harpers of later Times, and Notices of the more remarkable Melodies and Pieces of the Collection." By Edward Bunting. Whatever differences of opinion may exist as to the high degree of

early civilisation and national glory laid claim to by the Irish people, it has never been questioned that, in the most remote times, they had at least a national music peculiar to themselves, and that their bards and harpers were eminently skilful in its performance. To Mr. Bunting the musical world are indebted for the best collection of Irish airs extant, from which Mr. T. Moore selected many for his celebrated collection. This work will be found highly interesting to such as are fond of studying the character of the Irish people through their music. One air, called "Ballindery," seems to prove that this people possessed a knowledge of counterpoint.

There is now ready for delivery to subscribers, a beautifully engraved Portrait of the late William Linley, Esq., President of the Madrigal Society, &c. &c., exquisitely engraved in the highest style of mezzotinto, by Lupton, from the original and much-admired picture by Sir Thomas Lawrence, P. R. A., in the Dulwich Gallery. The number is strictly limited to one hundred, to be delivered to subscribers only. Price one guinea each, and published by Messrs. Leggatt and Neville, 79 Cornhill. We have seen the portrait from which this engraving is taken; it is an excellent youthful likeness of that highly-talented amateur, and is worthy a place in the collections of his friends and admirers.

MISCELLANEOUS LITERARY NOTICES.

GERMANY.

THE number of students in the several German and Dutch universities, at the commencement of the year, was as follows:—

Berlin . .	1778	Jena . .	450
Bonn . .	648	Leipzig . .	925
Breslau . .	631	Leyden . .	614
Erlangen . .	325	Marburg . .	276
Freiburg . .	315	Munich . .	1440
Giessen . .	377	Rostock . .	115
Göttingen . .	675	Tubingen . .	729
Groningen . .	274	Utrecht . .	510
Heidelberg . .	622	Wurzburg . .	447

LEIPZIG.—Dr. Julius Fuerst, a very learned Jewish theologian, has been appointed tutor and professor of the Hebrew and Talmudian languages to the university.

Upwards of 18,500*l.* has been placed by order of the late King of Prussia at the disposal of a committee formed for effecting the restoration and completion of the cathedral at Cologne.

Professor Gebauer, of Breslau, has succeeded in taking the most minute objects by means of the Daguerreotype and the aid of the Drummond light.

Dahlmann, of Jena, has completed the first volume of his "History of Denmark;" this elaborate work is now in the press.

There are 81 journals published in the Austrian empire; of these 36 are political periodicals, and are written—16 in the German, 11 in Italian, 5 in Hungarian, 1 in Bohemian, 1 in Illyrian, and 1 in the Wallachian languages. The *Beobachter* is the only periodical having original foreign correspondence. The *Ost und West* is celebrated for the great literary talent displayed in the articles of its many gifted contributors. The *Wiener Jahrbucher* is not a political journal, but enjoys a large and influential circulation. Of the non-political periodicals, 45 are in the German, 38 in Italian, 4 in the Bohemian, 3 in the Hungarian, 1 in Latin, 1 in French; and 1 in the Servian lan-

guages. The two enjoying the greatest circulation are the *Theater Zeitung* and the *Humorist*; the former containing well written notices on all that refers to trade and the arts.

Joseph Lalich, a schoolmaster in Verbovszko, in Hungary, has discovered a certain cure for hydrophobia. His method having in every instance been attended with success, the Emperor of Austria presented him with 700*l.*, and an annuity of 150*l.* during his natural life.

The first part of K. von Raumer's "Crusades," (*Kreuzzüge*), has been published at Stuttgart; the work is divided into four essays. The first is on "Napoleon and Germany," in which the learned author takes a different view to Victor Hugo. The second essay, on the "Poet and the Writer of Travels," is principally directed against Lamartine's "Travels in the East." The third essay answers the query, "Does Sweden rise, or does the Baltic recede;" and the fourth and last essay on "The Geography of the English," in which Hugh Murray's *Encyclopædia of Geography* is especially noticed and approved of. The work is exceedingly interesting, and worthy attentive perusal.

HANOVER.—The prohibition of all works treating of, or relating to the constitutional laws of this kingdom, has had a serious effect on the literature of the country; added to these severe measures, the prohibition of the Leipzig "*Allgemeine Zeitung*," and the penalty attached to any person receiving the same within the kingdom of Hanover, has produced very loud and general complaints here, and in other parts of Germany.

HEIDELBERG.—The son of the celebrated Oriental traveller, Zacharia, is preparing for publication the travels of his father, undertaken in 1837 and 1838.

GÖTTINGEN.—Ottfried Müller has left this city, in company with Schöll, on an archæ-

ological tour to the Neapolitan states and Greece.

OFEN.—The death of Professor Wesslerer, who was engaged on a "Numismatical History of Hungary," having prevented the completion of that desirable work, J. Rupp is now compiling a "Compendium of Hungarian Numismatics," extracted principally from the papers of the late professor.

COLOGNE.—A labourer has discovered, two feet below the surface of the earth, an antique urn, containing 823 silver and 4 golden Roman coins of Vespasian, Adrian, and Antonius Pius.

PESTH.—Two new Bohemian periodicals have appeared this year, the *Dennice* (Morning Star), published by J. B. Maly, and the *Wlastimil*, (the Friend of Home). The former is chiefly filled with translations from the works of Thomas Moore, Dumas, "Boz," &c.; the columns of the latter are principally filled with original articles of sterling merit. From the pages of the *Bohemia* we learn that Ignaz Palme, who spent eleven months in Koordistan, and who is conversant with French, Italian, and Arabic, is about to resume his eastern travels. The *Panorama des Universums* is about to publish copious extracts from the first series of his travels, now in the press.

Professor Swoboda has published a Latin translation of Goethe's "*Iphigenia auf Tauris*," in verse.

FRANKFORT.—The Taunus railway from this town to Wiesbaden and Mayence is now open the whole distance.

OLDENBURG.—There are three newspapers published in this town, the *Humoristische Blätter*, and the *Mittheilungen aus Oldenburg*. The *Oldenburger Anzeiger* is, however, the most read. Literature is at a low ebb, and the Ducal Library, open four times a week to the public, is scarcely visited for literary purposes.

SICILY.

The literature of this island continues in the same state that it was half a century ago.

The only recent publication on ecclesiastical literature is the "*De venerabili eucharistia*," by Catalano, in four volumes. The study of medicine is now attracting considerable attention, and through the exertions of Antonio di Giacomo, Franc Scuderi, and Rosario Scudèri, the people no longer look on charms, the evil eye, signs, and other absurdities, as the sole causes of all illness. The homœopaths, however, are promulgating their vicious doctrines. Jurisprudence, like philosophy, is entirely neglected in the island, and is in such an unsatisfactory state, that each councillor is enabled to work out any conclusion he finds most convenient to his pocket. The highest bribe is invariably the consideration which influences the decision. An institution has been formed for

the promotion of agriculture and manufactures, but it has not produced any satisfactory results. M. Politi, a most distinguished antiquary and architect, has been enabled to form a valuable cabinet of paintings, engravings, antique vases, minerals, and medals at Girgenti, together with a small library of books, the whole of which he has opened for public inspection.

The first attempt to diffuse Sicilian literature, through periodicals, was by Domenico Schiavo, in 1756, and in 1764 a *New Miscellany* appeared by Sergio.

The latter was followed in 1772 by the *Giornale ecclesiastico*, the *Notizie de letterati*, the *Gazetta Letteraria*, which appear in a series of letters, and the *Giornale di tutte le Scienze*; from 1790 to 1810, during the troubles of Sicily, a dead silence prevailed in every department of literature; in 1814 the *Giornale di Palermo* and the *Giornale enciclopédico di Sicilia* appeared; the latter containing articles on foreign literature, was soon withdrawn. The *Deca di belle Arti* was the next periodical of note, and contained contributions from Franco, Juzenga and Agnello.

The periodicals of the present day appearing in Sicily are the *Ceres*, a daily journal, the *Erix*, a political journal twice each week; the *Sicilian telegraph*, and the *Biblioteca sacra*; in addition to these there are two or three medical periodicals, and the *Indagatore*, the *Peloritanian Observer*, the *Spectator* by Zancle, the *Maurolico*, edited by Mortillaro, and the *Marcus*, appear weekly in Messina. The *Atti*, the organ of the Genoese academy, appears half-yearly, and the *Monitore economico-technologico-agrarico*, delivers two sheets monthly. In addition to these there are 15 periodicals now publishing in Palermo:—1, *L'Effemeridi scientifiche e letterarie*; 2, *Il Giornale di Scienze, Lettere ed Arti*; 3, *Il Giornale di Statistica*; 4, *La Clinica chirurgica dello Spedale civico*; 5, *Gli Annali della Medicina omiopatica*; 6, *Il Giornale de Commercio e d'Industria*; 7, *Il Giornale dell'Intendenza*; 8, *La Cerere*; 9, *La Guida Sicula*; 10, *L'Oreto*; 11, *Il Caffè*; 12, *La fata galante*; 13, *L'Occhio*; 14, *La Ruota*; and 15, *L'Utile*. Among the new periodicals, *La Sentinella del Peloro* has appeared with every probability of success at Messina, and *Il Trovatore* at Catanea.

The public schools are conducted on the Bell-Lancastrian system, which was first introduced into Italy in Piedmont, and has been adopted in Sicily by the *Commissione della pubblica istruzione ed educazione*, who have ordered that a public school shall be formed on this method to every 4000 inhabitants.

FRANCE.

During the last year 5324 works were published in France, 287 musical compositions, and 1015 copper-plate and lithographic engravings, and 100 maps.

A work on the ancient manners of the Normans, and their code of criminal and exchequer laws in Normandy from 1207 to 1245, has been reprinted from a MS. found in the Bibliothèque St. Gèneviève.

The Society of Antiquarians at Rouen have offered a gold medal for the best reply to the question—"What was the state of feudalism under the government of the Dukes of Normandy?"

Didot frères, the celebrated Parisian publishers, have announced the following works in continuation of their *Univers pittoresque*:—the "*Histoire et Description de la Pologne*," by Foster, in one volume, with plates, and a "*Histoire et Description de la Turquie*," by Jouannin; and van Gaver Jouannin, who has been residing for a long time in the East, and by his aid the work will be embellished with upwards of 100 engravings.

F. Denis has published a work of very curious and entertaining legends, entitled "*Chronicles chevaleresques de l'Espagne et du Portugal, suivies du Tisserand de Segovie*," a drama of the seventeenth century; the notes are valuable, and evince considerable research. The "*Bibliotheca Charpentier*," a collection of the best French and foreign works, is to be enriched by "*Poésies complètes de Sainte Beuve*," and "*Oeuvres complètes de Rabelais*," with notes by C. Labitte, the "*Memoirs of Alfieri*," translated by A. de Latour, a translation of the Koran by Kasimirski, and Klopstock's "*Messias*," translated by the Baroness Carlowitz, and the two parts of Goethe's "*Faust*," translated by H. Braze.

Captain Lafont de Lurzy has published one of the most interesting works of travels which has appeared in Paris for many years, the "*Quinze ans de voyages autour du monde*." The author possesses the happy facility of fixing the interest of his readers, and carrying them throughout the whole work. The remarks on the opium trade, and on the English colonization of Africa, show a perfect knowledge of these intricate subjects. The work comprises three volumes, illustrated with numerous plates. The two first have already appeared, and the third is now in the press.

BELGIUM.

Two new universities are in the course of formation in Belgium: one at Antwerp, under the auspices of Viscount Chateaubriant, and the other at Ghent. The institution of public schools in Belgium is much needed, the proportion of educated children to the uneducated being 1 in 10; and in the province of Brabant, which is generally considered the best educated, in a population of 5873 young men of 18 and 19 years of age, 3105 were found unable to read or write.

Great preparations are making for the celebration of the opening of Rubens' monument in the month of August. Two prizes have been offered for the best poem

and the best prose essay in honour of this celebrated painter.

ITALY.

A very interesting work has just appeared at Milan, entitled "*Attuale storia del progresso ed dell' incilimento dell' umano intelletto desunta dal titolo dei Giornali*."

Academies of sciences and arts have been formed under the auspices of the Austrian government at Venice and Milan; at the latter the professors are Morosi and Carlini for astronomy, Consigliacchi for physics, Dr. Franconetti, Count Litta, A. N. Manzoni, and Professor Bordoni. The president is Count Castiglione. At Venice J. Santini is appointed professor of astronomy, and B. Gamba, librarian of the Marc's Library.

According to a recent police regulation every shopkeeper in Naples is compelled to suspend two lighted glass lamps before his house every evening, for the purpose of affording light to the city.

TURIN.—The Countess Diodata Rovero di Novello, the authoress of several lyrical poems and twelve dramatic novels, including the celebrated poem "*Sparzia*," terminated her mortal career in this city on the 5th ult. at the advanced age of sixty-five; she was the daughter of the late Marquis Giuseppe Angelo di Saluzzo, one of the founders of the royal academy of Turin.

Rosini, the celebrated Italian scholar, who has translated two romances into French, and one into German, has just published the first nine numbers of his "*Storia della pittura italiana, esposta coi monumenti*," which he has dedicated to the King of France. The chronological arrangement is excellent. The copies from the works of Nicolo and Giunta Pisano, the two allegorical pictures of Simon Memmi, and several of the effusions of Fiesole, are highly interesting.

SWEDEN.

Among the translations lately published here may be remarked Schwab's *Hero-Legends*, Oehlenschläger's *Correggio*, Victor Hugo's *Hernani*, &c., besides the current novels of the day.

Professor Grubbe, of Upsala, has just favoured us with a goodly octavo, under the title of "*Philosophical Development of the Rights of Society*."

Tegnér's two last poems are, a conservative "*Salutation Song*" to the House of Nobles on the opening of the Diet, and a fine "*Lament*" on the death of Archbishop Wallin.

The Lady Brehmer, who is now well known not only in Scandinavia but in Germany also, has gained great applause by her last beautiful novel, "*Home*." It should by all means be translated.

The "*Legendary History of Sweden*," by Afzelius, a clergyman distinguished for his antiquarian researches, of which two small

volumes have appeared, is admirably written, and, as might be expected from the title, is full of historical pictures, traditional tales, and snatches of song and superstition. The whole work will probably consist of three or four volumes.

Among the illustrated serials now publishing, we cannot omit mentioning and recommending Nillson's "Primitive Inhabitants of the Scandinavian North," and Hedenborg's "Manners, Customs and Costumes of Turkey."

A year or two ago "old-book shops" were unknown here; now there are three in Stockholm.

POLAND.

Professor Poplinski, in his new work on Numismatics, now in course of publication, denies the current opinion that Poland, previous to the year 1300, had only coins of leather (*aspergillorum*), which were washed with an alloy of silver and copper, and stamped with an antique bust; but that during the government of King Wenzel, who ascended the throne of Poland in 1300, and about the year 1333, the small groschen were first introduced, called by *Miechowita*, the Polish historian of Cracow, *asperioles*; and further, that previous to that period (1300), the barter between the Poles and the more northern tribes, was effected by means of skins, hides, and furs.

RUSSIA.

A work on the state of public instruction in the Russian empire, recently published at

Hamburg, shows the following as the result of a government inquiry. There are 100,000 scholars in the public and private schools in the Russian empire. In the seven universities there are 2700 students. The educational establishments in St. Petersburg, under the patronage and direction of the government, are—9 gymnasiums, 50 high schools, and 104 national and 100 private schools; while the city of Berlin has only 5 gymnasiums and about 250 other schools. In the year 1838, 777 original works were published in the Russian empire, and 51 periodicals; 500,000 books were imported from foreign countries into Russia during the last year (1839).

GREECE.

ATHENS.—The first volume of "Sharlatos Byzantio's Old and New Greek Lexicon," has just been published by Koromilas, who, also has just issued his "Old and New Geography," "Chortabis's physical, mathematical, and political Geography," and "Gennadio's translation of Kammer's *Allgemeiner Geschichte*."

CHINA.

Slawuskowski, a Polish noble, who was banished to Siberia, but afterwards received permission to visit China, has established a school of the French and Polish languages at Maimotsky for the last two years, and has now between 4 and 500 scholars, among whom are many of the sons of Mandarines and Tatar nobles.

LIST OF THE PRINCIPAL NEW WORKS

PUBLISHED ON THE CONTINENT.

FROM APRIL TO JUNE, 1840, INCLUSIVE.

THEOLOGY AND ECCLESIASTICAL LITERATURE.

- Dictionnaire des Prédicateurs, ou Choix des meilleurs sermons prononcés par les orateurs les plus célèbres, réunis et classés par ordre de matière. Vol. III. 8vo Paris.
- Die alten Gebete der Israeliten. Uebersetzt und durch Anmerkungen erläutert von M. J. Landau. 8vo Prague. 3s 6d
- Göschl, Geschichtliche Darstellung des grossen allgemeinen Concils zu Trient, Part II. 8vo Regensburg. Price complete 11s
- Gothicae versionis epistolarum divi Pauli ad Thessalonicenses secundae, ad Timotheum, ad Titum, ad Philemonem, quae supersunt ex Ambrosianae bibliothecae palimpsestis deprompta C. O. Castillionaeus. 4to Milan.
